Abstract

Pacific knowledge systems have always had to deal with change. Living in the vastness of the Pacific and exposed to environmental challenges has resulted in communities that are constantly needing to adapt to improve their conditions. Climate change (CC) is a more recent and indeed urgent phenomenon to which to respond. The Education for Sustainable Development (ESD) agenda established by the United Nations Educational Scientific and Cultural Organisation (UNESCO) is an attempt to encourage communities to set in place educational responses and strategies and to make informed choices regarding sustainable issues now and in the future.

The authors have worked on educational responses to ESD and CC in the Pacific over many years. Central to their approach has been the acknowledgment that both ESD and CC require a broad based, interdisciplinary, and holistic approach and any approach must uphold culture as its underpinning driver. Being critically sharpened by experiences of living in the colonized reality of Aotearoa/New Zealand and familiar with old Polynesian values, the authors are able to work alongside communities to coconstruct innovative solutions to assist in fulfilling the ESD agendas in the Pacific. Such experiences can be made relevant to other contexts.

This article will review approaches to ESD and CC education in two case studies in which Indigenous concepts were made central. Firstly in Kiribati, where the research was undertaken in partnership with Ministries, UNESCO Apia, and NGOs to firstly map the current school curriculum to include and strengthen climate change education (CCE) by creating a CCE framework which is culturally and contextually relevant.

Secondly, in the nonformal sector, the authors led work with an NGO in Samoa to train “Taiala” (pathbreakers) to incorporate the principles of ESD and CC adaptation into their villages through a leadership training workshop.

On both occasions, the approaches allowed for an innovative mix of Indigenous models to form an integral part of finding solutions to the ESD and CC challenges and to also ensure that the application was appropriate and allowed for successful educational outcomes as determined by the communities themselves and also for themselves.

Keywords

Indigenous knowledge (IK) · Education for sustainable development (ESD) · Climate change education (CCE) · Pacific development · Fonua · Tofi

Introduction

This chapter examines the application of Indigenous notions and approaches to two case studies in which sustainable development was emerging as a challenge. It discusses firstly the efforts by a State actor, the Ministry of Education (MOE) in

the Micronesian nation of Kiribati to include CC in its curriculum. The next case study focuses on an NGO (nongovernment organization), Matuaileo'o Environment Trust (METI) from the Polynesian nation of Samoa, whose aim was to incorporate the principles of education for sustainable development in the routines of village life in 50 villages through an education and leadership development endeavor in response to local needs.

Both cases emerged through a series of strategic and collaborative partnerships. The actors in the first case were UNESCO Pacific, Ministry of Education (MOE) Kiribati, Indigenous Māori and Pacific Adult Education Charitable Trust (IMPAECT*) a New Zealand NGO, and the University of Waikato. They were tasked to develop a Climate Change Curriculum Framework (CCCF) for Kiribati that is appropriate to their current realities. Further, in both case studies, Indigenous knowledge systems were a strong contributor to empowering the communities to transform themselves to meet their own cultural, spiritual, and economic aspirations in the face of an uncertain world.

From a global level, both cases were also guided by international policy commitments: The Millennium Development Goals (MDG), Education For All (EFA), and more recently the Sustainable Development Goals (SDGs) which were sanctioned by the United Nations in September 2015.

Global Contexts

The developing nations of the South Pacific generally have high regard for international global policy on education. Over past years, these nations have worked closely with development partners on initiatives to address shared education challenges in the region (UNESCO 2015). Through the transition from EFA and MDG to the SDGs, there have been valuable lessons and experiences to inform the way forward. At the core of the 2030 Agenda for Sustainable Development is the notion of inclusion (United Nations 2017).

Education is a codified stand-alone goal. Goal 4 of the SDGs states “ensure inclusive and equitable quality education and promote lifelong learning opportunities for all” by 2030. At a high-level UNESCO meeting in Paris in November 2015, there was also agreement on the Education 2030 Framework for Action (United Nations 2017). Equally important for the Pacific region was the December 2015 gathering of world leaders at the United Nations CC Conference (COP 21), where global agreements on global warming and tackling climate change were adopted. Integral to the success of the COP21 plan are education and training, to raise awareness and to assist people in making informed decisions while promoting changes in lifestyles, attitudes, and behaviors.

Given the comparative slowness of progressing the United Nations intentions, the realities for the small, isolated, and low-lying Pacific nations is that they are being negatively impacted by CC and other global issues now and increasingly in multiple rates.

Education for Sustainable Development (ESD), Climate Change (CC), and Pacific Indigenous Knowledge

Thaman (2009) presents an argument for Pacific nations to hold on to their cultures through educational platforms especially in terms of developing resilience strategies. She suggests a total transformation in the way Pacific nations approach education, as some practices in both industrial countries and the Pacific are moving in a direction of unsustainability. As it is for all nations, ESD for the Pacific nations is essential given the environmental pressures, the pervasive individualism, and systemic selfishness that underpins capitalism and its education systems (Teaero 2003; Thaman 2009; Vaioleti 2011; Vaioleti et al. 2012).

Sustainable development is not a new idea for the Pacific nations (Teaero 2010; Vaioleti 2011). For some, living in isolated islands with limited land mass and high dependence on the ocean and weather for their survival, their education systems have traditionally taught them how to live with nature, support each other, and respect their environment as active and codependant members of a coherent system. Their Indigenous education was about learning one's *tofi* (or *tofi'a*: role and responsibility) which was a way of life or living that maintained balance and harmony with each other, nature, and the god/s (*fonua*). This is a way of being, otherwise referred to as *fakafonua*, which refers to the practices or ways of the land. *Faka* or *fa'a* in Samoan and *vaka* in Fijian means "way of" and *fonua* (Tongan) is a notion that in its physical form means the land and all that is contained within, including the water bodies in its environment. In its intellectual form, it can mean language, thought, and political system; it can mean its cultural social systems or religious systems that all add up to the knowledge particular to an area or a group. *Fonua* is the Tongan spelling with the same concept expressed as *fanua* in Samoan, *whenua* in Māori, *vanua* in Fiji, and *enua* in the Cook Islands. *Fakafonua* includes the practices of the *fonua* of Tonga; *fa'asamoa* and *fa'afanua* are the Samoan practices.

Pacific Indigenous thought systems and knowledge are relational, functional, and contextualized. Their basic ontology is conducive to reciprocity and respect that leads to balance and harmonious existence, a holistic type of sustainability. ESD advocates a spirit of preservation that Pacific peoples identify and align with in their ecologically anchored social/cultural practices such as *fakatonga* or *fakasamoa* (Teaero 2009; Thaman 2009; Vaioleti et al. 2012).

The emergence of sustainable development that underpinned the climate change research in Kiribati and that involved the community in Samoa had to be contextualized respectively to the *fonua* therefore aligning with the three pillars for ESD: society, environment, and economy. The addition of culture as the fourth pillar is vital for Pacific nations. Culture influences the work with which the authors are involved including those discussed in this chapter. The authors' work with Indigenous communities in Samoa, Tonga, Fiji, Kiribati, the Solomon Islands, and Vanuatu were underpinned by their local perspectives and respective cultures (Vaioleti et al. 2002; Vaioleti 2011).

Kiribati MOE and Climate Change Curriculum Framework (CCCF)

The former Secretary-General of the United Nations, Ban Ki-Moon, stated that climate change is “the defining issue of our era” (United Nations 2008). Nowhere is this more pertinent than in Small Island Developing States (SIDS) where some of the most vulnerable peoples live. In the Republic of Kiribati, climate change is already being experienced and urgent attention is being led by the Office of the President.

At the UN level, the Republic of Kiribati has been using many global frameworks to raise these issues. It has been working extensively with the many agreements that acknowledge the challenges that Small Island Developing States (SIDS) face in the effort towards achieving sustainable development. These include the United Nations Framework Convention on CC, Barbados Program of Action, Millennium Development Goals the United Nations Framework Convention on Climate Change (UNFCCC), the Sustainable Development Goals, as well as the Kyoto Protocol.

Midway through 2011 and in the ensuing 2 years, the authors led a team of researchers to develop a Climate Change Curriculum Framework (CCCF) for Kiribati which was based on the principles of Education for Sustainable Development (ESD). This group of researchers worked in partnership with the Pacific branch of UNESCO based in Samoa. The tasks were to:

- Map the existing curriculum across all the school subjects to assess the extent to which CC-related areas were being taught
- To find appropriate points of intervention to include CC in the curriculum where it was not being taught

The Republic of Kiribati is comprised of 33 small fragmented remote low-lying islands spread over four million square kilometers, yet its total land area is only 726 km². The main administrative centre of Kiribati is South Tarawa which is undergoing rapid and intensive urbanization. The Kiribati 2009 Demographic and Health Survey shows that the total population in mid-2010 was 103,466 (92,533 at the time of the 2005 census), and 50,010 of the total (just under 50%) were living in South Tarawa. Half of the Kiribati population is under the age of 21 and 36% of the total is under the age of 15 years (Kiribati Demographic and Health Survey 2009). With a heavy youth population, there are serious implications for future planning in an already resource constrained environment, especially when an increase in population is predicted (Bedford and Hugo 2011).

The impacts of CC are expected to be severe and, as reported in a World Bank Report, will have serious impacts on coastal land and infrastructure, water resources, agriculture, human health, ecosystems, and fisheries (as cited in Logan 2009). These impacts for Kiribati are already evident in Tarawa where the research team for this project observed rising sea level against low-lying lands, the impact of sea acidification on seafood sources, intrusion of sea water into wells, other water supplies, food fields, and increased severity and regularity of natural disasters. On top of these,

the challenges are magnified by physical isolation, heavy reliance on others for sea and air connections, and lack of a close relationship with other developed countries, financial and other resources.

For Kiribati, there are many urgent crises looming, including rising sea levels, the rapid decline in sea-based food supply for the local population and the economy due to acidification, decreased water quality, and dwindling water sources. Internal migration from outer islands to Tarawa for a better life through education and employment multiply the infrastructural challenges that are common to most smaller and poor Pacific nations. In addition, CC challenges experienced by such low-lying nations such as Kiribati further exacerbate these pressures at unsustainable levels.

The expansion of human activities and importation of foreign materials, services, and food associated with population growth also threatens the limited environmental resources, the islands' traditional subsistence economy, traditional knowledge systems, and culture. Yet despite these challenges, the communities endeavor to make a life from the limited resources they have, which is an important ESD lesson from which schools could learn. The research team observed an example of this propensity to adapt to changing environments, by young people using the land vacated by the sea at low tide for organized football and other games until the tide returned. These tendencies to rise above disasters are strengths that are associated with I-Kiribati. (I-Kiribati is a term which refers to the Indigenous people of Kiribati.) It is claimed that more than any other Micronesian country, Kiribati has held on to its traditional values and customs (Teaero 2009).

The Kiribati 2010 National Framework for CC and Climate Change Adaptation asserts that culture and identity as I-Kiribati is imperative and must be at the forefront of discussions (Office of Te Beretitenti Republic of Kiribati 2010). The intention of the Climate Change Framework was to encourage the use of local culture in tandem with scientific knowledge to preserve and grow cultural and traditional knowledge and to build a holistic capability to cope with CC and its challenges. This was seen as important to keep up with the twenty-first-century knowledge and community membership while maintaining identity, pride, and global citizenship obligations.

This framework then is a Kiribati scientific and cultural response to the climate change discourses. It recognizes the central role that the community plays in giving effect to such transformation. Cultural values and relationships between people and their lands and seas inform our deliberations in the formation of the framework. The work undertaken by Logan (2009, pp. 18–19) which notes “the degree to which Kiribati values influence adaptation to climate change” and that “cultural traditions are still very strong and relevant at all levels of governance” reinforces this position.

H.O.P.E Framework as a Methodology

The H.O.P.E Framework was applied and referenced from the Tokyo Declaration of HOPE 2009 and had significant input from Professor Konai Thaman, reputed Tongan scholar, poet, and philosopher. In that document, “Holistic,” “Ownership-based,” “Participatory,” and “Empowering” were characteristics that have both informed and

surfaced from ESD practice and have synergy with Pacific research values. The H.O.P.E acronym provides a list of the characteristics; the arrows indicate that it is not just a set of descriptions but an intricate interrelationship between the characteristics that deepens ESD practice. Talanoa, which is a term used for consultations, exchanges, and is guided by Pacific protocols (Vaiolati 2006, 2011, 2013) as well as being the base of culturally relevant Pacific research methodology, was used to guide the consultation and conversation with stakeholders. The combination of these two localized and international frameworks advocated and guided this ESD and CC endeavor. The structure of H.O.P.E is as below (Fig. 1).

The following commentary discusses the application of the H.O.P.E elements in the Kiribati CCCF development.

H for Holistic

Teaero (2009) suggests that, for I-Kiribati, the wholeness of a person is based on three significant values encompassed in *te mauri* (traditional blessings), *te raoi* (peace), and *ao te tabomoa* (prosperity), and that the teaching of appropriate cultural values and their application will help on all matters and aspects of life. These values informed all the research and development team's considerations throughout the development and relationships with the Kiribati stakeholders.

The research team, however, realized that CC education and ESD are important transformative agents and it needed to move people to adopt behaviors and practices to live full and worthwhile lives by combining holistic as well as scientific approaches. It was necessary for the team to reconceptualize CC in ways that will encourage educators, planners, and learners to engage CCE and ESD in a systemic and holistic way. To allow for ease of planning, teaching, and learning the project was guided by the following four themes:

- Awareness: Creating and raising awareness through education and public information
- Adaptation: Coconstructing strategies with partners, some of which may come from traditional practices to adapt to CC
- Mitigation: Coconstructing responses with partners to reduce the impact of CC
- Related issues: The responses to issues brought about by CC or loss of identity, environment degradation, poverty, and marginalization as a result of unequal

Fig. 1 Structure of H.O.P.E framework (As adopted from Asia-Pacific Centre for Culture for UNESCO 2009, p. 8)

development which may include urbanization, loss of leadership due to the migration of leaders, or professional classes (young and old) to global markets

O for Ownership

It was vital that the research team worked with the local community to ensure that the curriculum was sourced in their culture or *fakafonua*. This allowed a sense of ownership of their learning and the goals for their school curriculum by the community. That insight drove the authors and the research and development team to ensure that local learning concepts, values, and language were included in the CC framework. Views of the teachers, teacher training institutions, NGOs, and churches were included in both constructions to enhance the communities' sense of ownership. In many ways the authors realized that communities and individuals already had an intrinsic awareness of the concept of *tofi* although it was locally named because of the kinship units of *mwenga* (household), *utu* (extended family), and *kainga* (kin relationships). The village systems thrived on everyone knowing their role.

P for Partnership

Partnering with community including youth, institutional experts locally and internationally, was vital for ensuring that the Framework was at the cutting edge of the CCE field, yet easily delivered and relevant to the educational needs of Kiribati in the twenty-first century and beyond.

There is a popular Kiribati saying which says that in discussions with the community you have to "sit on their mat." Therefore finding out whose mat to sit on then building relationships which allowed for the shared sitting involved having community partners with which to work. Partnerships were essential to the ongoing success of the project and the development needs of the country, a point made by Corcoran (2016) in his PhD thesis on the implications of climate change for the livelihoods of urban dwellers in Kiribati.

The research for the CCCF was reviewed by experts on ESD and Education for All (EFA), including UNESCO (Paris ESD team), South Pacific Regional Environmental Programmes (SPREP) Samoa, and the Universities of Washington and Hawai'i.

E for Empowerment

The authors met on two occasions with several village leaders, public servants, school leaders and students to listen to what they identified as being important factors to include in the CC and ESD elements of the school curriculum. This was important to ensure the inclusion of community voices, affirm community aspirations, and to ensure the decision making (present and future) would be led by the community.

Mapping of the Current Curriculum

The CCCF maps the curriculum to locate and assess CC-related topic coverage within and across the subjects. There were three ways that the CCCF team used to identify their findings and to suggest where it may be possible to insert CC topics into each subject. A tick was used to signal that an existing topic was definitely CC-related. The letter “p” (for possible) indicated a topic that could be CC-related in the different subjects. An “o” (for opportunity) was given to a point in a subject that could be an entry point for a CC-related topic. We have not discussed the mapping chart that revealed the “p” finding in this discussion as it has less significance to the topic of this chapter. The following represents the occurrence of CC topics accumulated for each existing subject area.

Distribution of CC Theme Topics in the Current Curriculum

It was found that the topics that may be related to CC were taught in environmental science only. Given that the pillars of ESD are economy, society, and culture as well as environment there was very little CC topics in developmental studies and social science which represent the ESD pillar of “Society”; very low CC topics in Agriculture, Science, Biology, Developmental science could represent the ESD pillar of “Economy.” Therefore there was a significant imbalance in the Kiribati curriculum if it was examined to assess its ESD and CC strength as seen in the following graph (Fig. 2).

Distribution of Four Climate Change Topics in the Curriculum

Using data from the mapping charts, the current CC-related topics in the curriculum were analyzed against the four Climate Change themes of Knowledge and Understanding, Adaptation, Mitigation, and Related issues. The following graph in Fig. 3 is the result.

What is very obvious from the above graph is the little attention that has been given to “Adaptation,” an area that is vital for the continuity and sustainability of the communities in Kiribati. It is an area that potentially could provide meaningful employment for the community. Under the theme of Related Issues, addressing migration and revitalization of culture that can lead to improved self-esteem and other sociopolitical benefits was also a strong consideration.

Possibility for the Future of I-Kiribati in Other Nations

A strong element of the many talanoa the CCCF team had with teachers, principals, parents, and young people was around the loss of tradition and culture due to urbanization and disconnection from home island or village. Anticipating that most of the current students may migrate to other nations in the near future, it

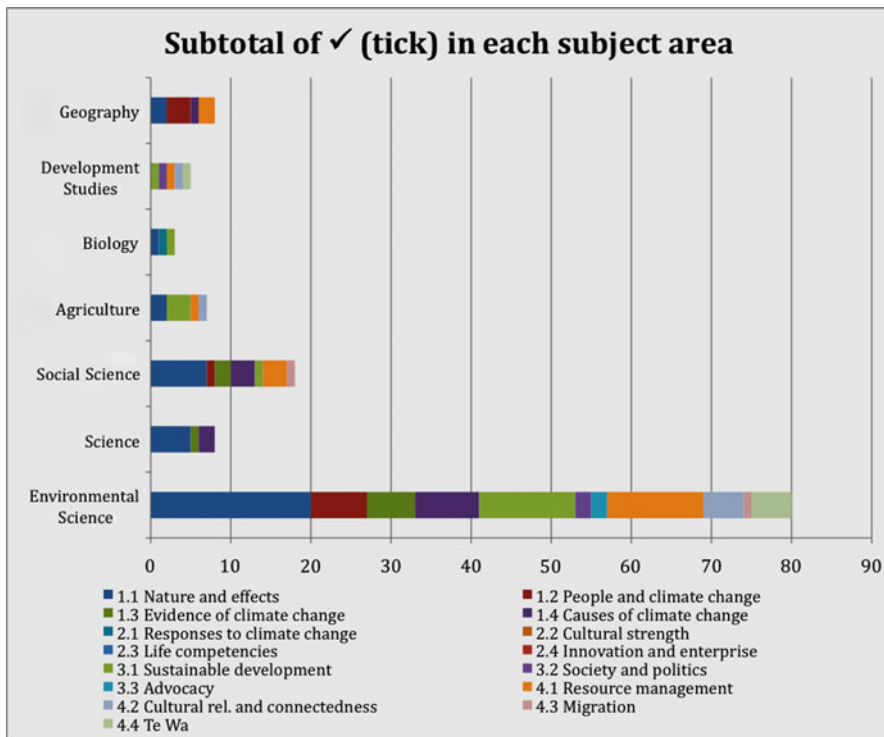

Fig. 2 Distribution of CC theme topics in the current curriculum (As adopted from Vaioleti et al. 2011, p. 42)

would be important to increase CCE across the four themes but mainly in the Related Issues theme to specifically reinforce students’ cultural fortitude to ensure identity and community continuity.

Entry points were identified as “o” for opportunity to include CCE topics into different subjects. These “o” points of entry were sought by CCCF team to create a CCE system that is spread across the four themes to make the curriculum more balanced, more relevant, stronger, and more culturally robust than it currently was. The following graph in Fig. 4 is the visual representation of these efforts.

The Kiribati President, Anote Tong, says that for many I-Kiribati communities, migration is a strong probability (Chapman 2012, p. 1). The school curriculum then must help prepare the community for international citizenship and the foundation for such success is in cultural continuity. Kiribati is a Pacific nation that is endeavoring to fortify itself against many challenges such as the erosion of its language, identity, urbanization, and the global threat of CC. One of the approaches it has taken is through introducing CC formally into its schools. Other Pacific nations are preparing for similar issues at different levels.

The next part of this chapter discusses such a case in Samoa, only this case study and approach has a more informal education and community approach.

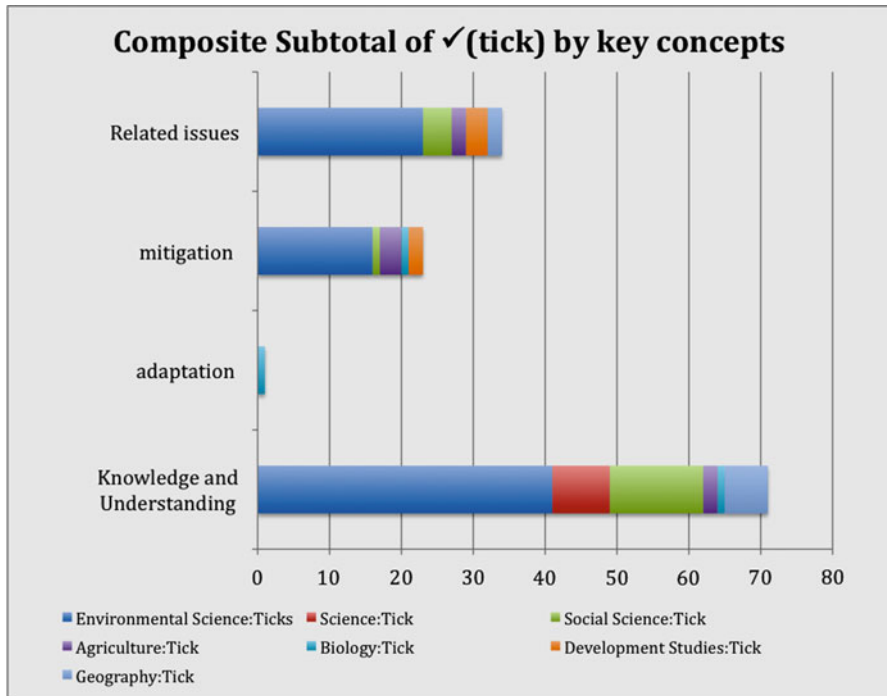

Fig. 3 Distribution of the Four Climate Change theme topics in the curriculum (Adopted from Vaioleti et al. 2011, p. 43)

Samoa and METI Taiala Program

A UNICEF report on the state of youth in the Pacific (2011, p. 11) shows that “young men not-in-education or work may be contributing little to their community. The issue is particularly serious in Kiribati, Marshall Islands and Samoa, where around half or more of young men aged 20–24 years are not engaged in productive activity (58 per cent of males 20–24 years in Kiribati, 44 per cent in Marshall Islands and 46 per cent in Samoa).”

In Samoa, over a quarter of the total population are in the wider youth-age group of 15–30 years (Curtain and Vakaoti 2011). Given high unemployment and under-employment (including in Kiribati), the particular challenges which young people in the Pacific area face include limited opportunities of decent and meaningful work. Meaningful work has a deep cultural and spiritual importance to the Indigenous cultures of the Pacific given their focus on being a subsistence economy.

Vaioleti (2011) wrote on the significance of a Tonga saying “Ko e faka'ilonga 'oe tangata ko 'ene ngaue” (the mark of a person is his/her work), contributing to the wellness of the group for the harmonious wellbeing of community living and existence in Tonga. His study also revealed that the aim of education for Tongan

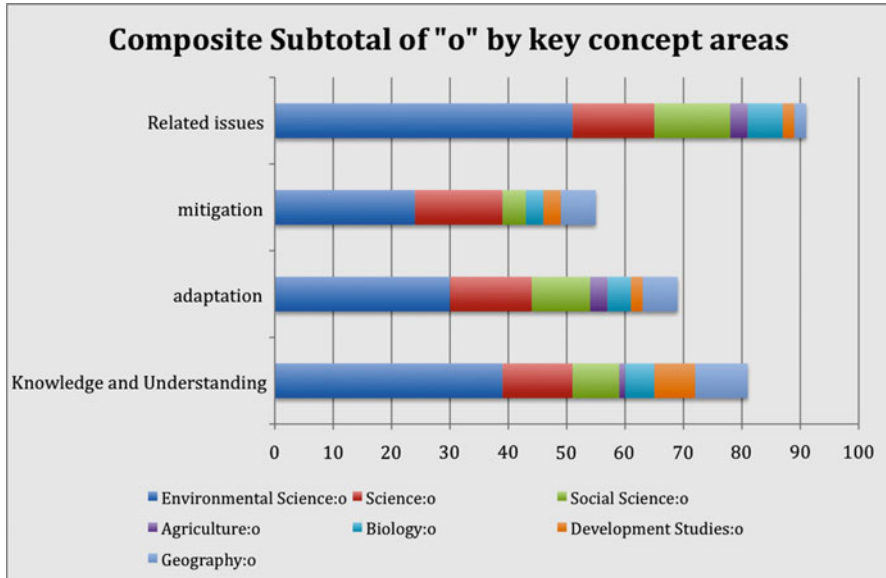

Fig. 4 Opportunity (“o”) points of entry for distribution of the four themes for CC topics and to also be an entry point to allow for enhancing cultural fortitude (Adopted from Vaoleti et al 2011, p.46)

people was to enable them to carry out their tofi’a (tofi, fatongia, roles) to their sisters, own families, and to the fonua in order to achieve and maintain harmony with each other and their god/s (ibid., pp. 184–186). One of the iconic poems to have come from the Pacific written by the paramount chief and current Head of State of Samoa Tuiatua Tamasese alluded to the importance of fatongia, tofi, or tofi’a (role, obligation, duty) of appropriate/meaningful work for the psychological, spiritual, and economic wellness of a Pacific person as below:

I am not an individual
 I share divinity with my ancestors, the land, the seas and the skies.
 I am not an individual, because I share a *tofi* with my family, my village and my nation.
 I belong to my family and my family belongs to me.
 I belong to my village and my village belongs to me.
 I belong to my nation and my nation belongs to me.
 This is the essence of my belonging. (Tui Atua 2009, p. 1)

One’s tofi is not only vital for the wellness of one’s family, village, and nation but it provides identity and self-worth to individuals. Meaningful work contributes to the cohesion of small villages where every person’s effective contribution is vital for the sustainability of their community, be it physical, economic, intellectual, emotional, or spiritual.

Given the consistent high unemployment in the Pacific, the Prime Minister of Samoa, the Hon. Tuilaepa Malielegaoi in his opening speech of the Pacific Region

Commonwealth Youth Ministers Meeting that Samoa hosted in 2015, declared that “we cannot keep doing the same things we did yesterday and hope for a different outcome” (Samoa Government 2015, p. 1). This statement then calls for different and innovative approaches and for both the formal sector and the informal and nonformal sectors to work collaboratively and in mutually beneficial ways to assist with meaningful work for the benefit of the fonua.

METI: A Case Study

Consonant with this thinking, METI, a well-established NGO, had already been aware of critical education gaps, of out-of-school youth, of health and educational issues that have a severe impact on the quality of livelihoods of the people with whom they were working in the villages. Thus, they were able to identify policy gaps and to provide education in order to effectively implement responses in the communities and villages of Samoa.

In 2002, METI worked with the authors to facilitate the training of trainers within a European Union-funded research and development project. This 2-week project was run in Fiji as well as in Samoa; it helped to establish METI’s capability of working in a participatory mode with grassroots communities, and it allowed METI’s staff to become familiar with adult education techniques. The authors promoted the application of Indigenous knowledge systems to crucial problems and for sustainability.

METI has as its mission “to provide a service to the people of Samoa that promotes simultaneously the preservation of their environment and the sustainable development of their natural resources and in addition helps them to develop into individuals living in harmony with nature” (METI 2016). Its vision continues along the same philosophy, namely “to provide participatory non-formal training of the necessary management skills and promote capacity building to achieve sustainable living in Samoa through self-reliance, particular of grassroots communities” (METI 2016).

When METI realized that the Government had identified major obstacles to sustainable development and poverty reduction at the community level, such as lack of education, of awareness, and of capacity on the part of the communities, and realized the need to collaborate, METI started to address these issues (Talanoa 2015). Over the years, METI has developed a wide-ranging project portfolio and has acquired a lot of expertise. Its current programs include the METI’s Non-communicable Diseases Programme (2013–2014), funded by a grant from the US Embassy; the grant allowed METI to expand its programs of health promotion (situated at the Samoa Sleep Clinic/Healthy Living Clinic in Apia) and to use its existing multisectoral outreach program (the Taiala programme) for conducting health surveys in ten villages around Samoa, raising awareness about obesity and a variety of noncommunicable diseases, their prevention and control.

METI has been accepted by the Samoa Qualifications Authority (SQA) as a “Non-Formal Learning Provider” and in 2013, its “Life Skills” training course was officially certified by the SQA. METI has now been invited to formally apply for recognition as

a “Post-Secondary Education Training (PSET) Provider” and to have its courses certified and credited, including “Permaculture Training,” “Basic English for Development,” and training courses for “Life Skills” coaches. In this way, graduates will receive credits that may help them to access additional courses at the Technical Colleges or the National University of Samoa.

METI also provides “Healthy Living” seminars on whole-food plant-based (WFPB) diet to reverse the effects of chronic diseases, and it offers health monitoring for those individuals who are willing to adopt the WFPB nutrition program. These seminars are changing the way Samoans think about food and nutrition, in addition to reversing the effects of chronic diseases like diabetes, high blood pressure, and obesity.

The release of the 2007 report of the Intergovernmental Panel on Climate Change (IPCC) came as a “wake-up call” to METI. It realized that the climate change is destined to have a far more destructive and far earlier impact than previously estimated; significant rises of global temperatures could well be experienced by the end of this century, bringing irreversible and devastating changes to the planet. As a result, METI decided to mainstream climate change action in all its projects and programs, and to deepen its involvement at the local level, in the villages, in the effort to promote improved and sustainable livelihoods for villagers, through climate change education (CCE) and education for sustainable development (ESD), as well as through the promotion of good health.

The Taiala Program

In 2010 METI officially created its Taiala program. This had been a mutual vision of the cofounder of METI, the late senior matai (chief) Matatumua Vermeulen and of the current director Dr. Walter Vermeulen. In a way the designation “Pathbreaker” signifies that the environment and social systems that have led to so much destruction and to the marginalization of so many (including women and youth) must be discontinued.

METI’s request – in the year 2000 – for assistance with Taiala training gained seeding funding from the Samoan Government. As a pilot scheme, a basic Life Skills Course (LSC) development program was held in 13 villages around Samoa. From among the 182 graduates of this course, 24 individuals were chosen for additional training that would lay the foundation of METI’s Taiala Programme.

The Taiala needed to be chosen from villages where the chiefs had a long-standing relationship and trust in the work of METI. The chosen village member would be expected to work collaboratively and cooperatively as members of a larger collective. Responsibility, reciprocity, as well as leadership skills were key values in their selection.

Those who were selected were ordinary men and women; some were chiefs (male and female) or orators, others married and single men and women, retired public servants, others were trusted taulelea or untitled men. What they all had in common is that they were sons and daughters of the villages in which they lived and worked.

Thanks to the respect and trust they command, the Taiala are individuals whom the other villagers will listen to and from whom they learn. The Taiala remain living in their respective villages and are the front-line health workers, education workers, and workers for sustainable development. Their experience has its source in their village communities and is shaped by their village; their acquired skills are then returned to the village. This is in line with the “aiga” (kinship) responsibility that is innate to them.

On 1 May 2015, having successfully obtained funding, METI’s 3-year Climate Change Action project started with the Taiala. The action, through a two-tier arrangement, consists of METI’s Central Training Team providing training, monitoring, and mentoring to the Taiala, who, in turn, implement several streams of interlinked activities in the target villages. The overall objective of the action is to attain – for a significant proportion of the adult population in 50 villages around Samoa, via culture sensitive participatory training and development – balanced, self-directed behavior, a more ecologically attuned world view, and the wisdom to engage in cooperative action. These are essential components of the spirit of collective and individual self-reliance which is needed for the communities’ sustainable wellbeing.

In June 2014, the authors conducted a weeklong “Facilitators and Leadership Training for the Taiala.” The format of the workshop was similar to the format successfully facilitated in 2002 under the CROPPRO, and drew on its success. The workshop had the following objectives:

1. To nurture a culture of harmony in homes and communities
2. To firmly embrace sustainable development
3. To engage with the meaningful mitigation of climate change and in actions of adaptation
4. To raise the Taiala’s level of awareness of the task to promote a spirit of self-reliance
5. To increase the capacity of the Taiala to engage with ease in the cultural, socioeconomic, and political lives of villages, of the country, and the world community

The theoretical basis of the workshop drew on the work of Rahman, who believes in grassroots mobilization for the promotion of the collective intellectual capacities of people (Rahman 1993): People conduct their own inquiries into their living conditions and their environment, and arrive at their own solutions. Moreover, the work of Freire, specifically his “problem-posing education” through the creation of “teacher-students” and “student-teachers” (Freire 1972), was regarded as an important tool in working towards empowerment.

The facilitators (also the authors) referenced the Pacific concept of “ako” (Vaiolleti 2011, 2013) to guide their learning relationship with the Taiala. Intrinsic to ako is the importance of learning Indigenous concepts such as compassion, respect, serving others and aiga (kainga or extended kin) important to maintaining harmonious living. One of the pillars of “ako” is empowerment. This is particularly vital, given the highly stratified societies of the Pacific, such as the societies of Tonga and Samoa (Vaiolleti 2011).

In the “ako” approach, the participants became teachers, helping the facilitators to conceptualize the relational structures of their villages and the needs of their clients, raising the facilitators to a level where they were able to align their own teaching with that of the participants; as a result, learning from the sessions became more relevant as discussed by Vaioleti (2011) as the “founga ako.” The building of relationships and sharing of power are integral to the philosophy of METI and are important factors for the success of “ako.”

The training strategy was to conduct a theoretical and practical workshop on integrated participatory actions; the topics of the workshop included methods and principles of adult learning and teaching, capacity-building and leadership-development, building resilience in order to achieve self-reliance, awareness of climate change and its impacts, and the concepts of sustainable development. METI’s leadership team were present during the workshop, enriching the approaches used. Through this partnership, the Taiala were able to bring in their traditional knowledge and customs, and to make sense of their wisdom at the interface of current ESD and scientific and academic discourses thus taking the learning back to their respective communities.

Given the considerable level of skill which METI had already started to develop in past training programs by working at ground or village level, the Taiala concept was considered by many of the participants capable of developing into an even more dynamic and successful initiative, as well as able to provide the leadership required for positive village transformations. While this would be subject to appropriate resources and ongoing training opportunities, it was noted also that ongoing mentoring was important as well as maintaining the relationships in the village, particularly with village chiefs.

Paramount in the minds of Samoans is “vā,” which is a broad Polynesian notion of the relational space between people and the environment, between people and their god/s (Thaman 2003, 2009; Vaioleti 2011). The needs connected to these basic coordinates dominate the thinking of the peoples of the Pacific, especially of the peoples of Samoa and Tonga, because, if those needs are satisfied, this leads to good relationships between people, and to good relationships between people and their environment and their god/s.

The workshop evaluation was testimony to the fact that the Taiala were willing and appreciative learners, wishing to immediately apply their new skills in the villages in which they worked. By the end of the workshops and professional development, the Taiala were each able to:

1. Display three examples of how they will contribute to harmonious relationships within family, community, and the global family
2. Communicate three practical applications of an ecologically attuned world view
3. Share one example of a political, economic, or cultural issue in the village they will engage in, in order to make things better
4. Display three examples of how they can use learning from the workshops to promote self-reliance and sustainability (for example, regarding food security)

5. Display three examples of cooperative action and how it can be adapted to different villages and communities and possibly be made a part of national policy
6. Show three examples of action adaptive to climate change in their villages (involving awareness, relocation, planting, with an eye on economic, nutritional, and health security)
7. Demonstrate three examples of behavior mitigating climate change in their villages and country (involving internal and international policies, as well as technical procedures)

However, the importance of the Taiala programme extends beyond a successful activity and a short period of training. The building of capacities focussed primarily on developing the skills of, and imparting the required knowledge to, the Taiala trainees in order to make them effective internal animators. This must be embedded in further developments, in order to continue their beneficial effects even after the project period and in order to strengthen METI's role in promoting lifelong learning.

The innovativeness of METI's approach to creating self-reliant communities which are capable of mitigating climate change and adapting to it consists in the integrated use of a variety of approaches. METI also displays a clear gender focus by ensuring that women are integral to its sustainable development activities. METI sees a real opportunity for a new role of the women's committee, a traditional institution in the Samoan village, especially as the crucial driving force for the acceptance, by the households, of WFPB nutrition as an antidote to obesity and NCD. Efforts will be made for a close working relationship between the women's committees and the cooperatives in the target villages. Within the METI Health programme, health seminars are now being held in village settings, using the Taiala. For the convenience of the public, these seminars are offered both during the day and in the evening.

In order to increase further peer support for sustainable development action, METI has encouraged individuals who have completed the nonformal trainings to set up cooperatives for farmers and producers in their respective villages. From a social point of view, cooperatives foster participation in decision-making: decisions are made inclusively and democratically. In this way the cooperatives offer their members peer support for continued permaculture (planting and food production using the patterns observed in the Samoan natural ecosystems) practice and sustainable development initiatives. The Taiala are also being trained to facilitate training workshops for farmers who wish to become eligible to join the participatory guarantee scheme of organic certification; this scheme is promoted by the Secretariat of the Pacific Community (SPC).

Looking to the Future

The Prime Minister of Samoa stated that education is the key to sustainable development.

As a consequence, the Government is committed to ensuring that Samoa achieves the UN Education Goal through the strategies outlined in the UNESCO's Framework for Action Education 2030 (Samoa Government 2015). METI is operating within a favorable political climate of sympathy towards the SDGs. The Government has a clear policy, encouraging "a new partnership" between the public sector and the private, and also between these sectors and the academic sector; it has welcomed METI's efforts in life skills training and permaculture promotion. Hopefully, this political goodwill is going to be strengthened when the results of the ongoing and intended actions become manifest.

With the implementation of the Taiala program in the target villages – introducing the Taiala as internal animators and active participants in cooperative activities – it is expected that the Taiala will make sure that "ownership" of decision-making remains at the level of the cooperatives, which will guarantee the sustainability of sustainable development action to underpin the mitigation of CC and the adaptation to climate change.

It is anticipated that a more enlightened village leadership will emerge following the sustained efforts at the village level to promote a new mind-set which reflects a more peaceful, inquisitive, and ecologically attuned world view. These efforts, it is expected, will lead to an increase in the ability of village leaders to make rational decisions and lead to vibrant communities, capable of carrying out self-reliant initiatives which will bolster their resilience.

Conclusion

Two case studies have been reviewed in this paper which focus on educational responses to ESD and CC in the Pacific. One case study occurs in the formal sector and the second case study occurs in the nonformal sector. Underpinning the educational response is the importance and the role of Indigenous knowledge systems which while contextual relate to the importance of fakafonua, the practices or ways of the land and through the concept of tofi or tofi'a to maintain balance and harmony with each other, nature, and the god/s (fonua). This then forms a Pacific Indigenous baseline for ESD and CC education, a philosophy that underpinned both the Kiribati CC curriculum development and Taiala program.

Pacific culture and knowledge has always been traditionally conceived, produced, applied, and critiqued by Pacific peoples, and therefore there exists a long-standing tradition of developing complex yet self-sustaining systems. The respect, reciprocity, and the enduring endeavor to maintain the vā, in turn, will continue to be an immensely significant and invaluable component of the cultural capital of the Pacific. However, as the boundaries of many Pacific nations have been challenged with growing globalization and the cash economy assuming greater centrality in the lives of Pacific peoples, the traditional skills and Indigenous knowledge are being gradually sidelined to the peripheries. Cultural concepts have a role in developing relevant skills, values, attitudes, identity, a sense of self-worth, a sense of belonging, knowledge, empathy all necessary to develop people's ability to engage effectively

and productively in everyday life even if they leave their home nations to seek opportunity elsewhere. Such a contribution is vital as the world seeks to explore solutions to the imposing problems of environmental challenges and climate change. Every person's contribution is vital for the sustainability of their community, be it physical, economic, intellectual, emotional, or spiritual; this all adds to a strong sense of belonging to a village, a community, a nation, and a global community whose survival depends on a collective momentum forward.

pipeline. These factors while extremely significant and relevant fail to grapple with the Indigenous factor. The Indigenous factor means that if you are Indigenous in colonized countries, you are likely to be among the most highly imprisoned peoples in the world. For Maori in Aotearoa (New Zealand), despite being 17% of the population, women make up 60% of the prison population and Maori men make up over 50%. Current analyses fail to grapple fully with the disproportionately high rate of Indigenous incarceration in settler states. Very often these factors are examined in isolation to the mass dispossession of Indigenous identity, lands, language, and culture over relatively few generations.

Maori community workers have long recognized that a key to turning around the imprisonment rates of Maori is twofold, it is a battle to change state systems which have shaped and enacted historical and contemporary injustice, and it is simultaneously a battle waged in restoring the hearts and minds of those impacted by imprisonment. Our researchers worked with Maori community workers and a group of 35 Maori men and women coming out of prison. Over 2 years we interviewed them and we attempted to reconnect them to their iwi history and iwi support. The initiative that we ran with iwi support was enormously successful. We worked with 35 Maori men and Maori women post release and although statistically 18 should have returned to prison within the first year, only four returned to prison. This article will look at what Maori researchers alongside of community workers and researchers did that enabled Maori men and women to successfully strengthen their lives, increase their understanding of their world, build support systems, and stay out of prison.

Introduction

Mass incarceration needs to be seen as part of the complex historical picture of the development of settler states, a picture that is located within the dispossession of land and identities. Most analysis locates mass incarceration as a school to prison pipeline (Pane and Rocco 2014), a poverty to prison pipeline (Jenkins 2017), a victimization to prison pipeline (Rook and Sexsmith 2017). These factors, while extremely significant and relevant, fail to grapple with the Indigenous factor. The Indigenous factor means that if you are Indigenous in colonized countries, you are likely to be among the most highly imprisoned peoples in the world. For Maori in Aotearoa, despite being 17% of the population, Maori women make up 60% of the prison population and Maori men make up over 50% (Department of Corrections [Corrections] 2016). Current analyses (Ministry of Justice 2000; Newbold 2007; Department of Corrections 2008a; Sensible Sentencing Trust 2011) fail to grapple fully with the disproportionately high rate of Indigenous incarceration in settler states.

Very often these factors are examined in isolation to the mass dispossession of Indigenous identity, lands, language, and culture over relatively few generations (Jackson 1988; Durie 2007; Quince 2007; Bull 2009; Mulholland and McIntosh 2011; Workman 2011; JustSpeak 2012; Tauri and Webb 2012; Mihaere 2015). In the last few years within New Zealand the prison population has gone from 6,000 to over 10,000 (Corrections 2016). The percentages of Maori have continued to increase in that time.

Maori community workers have long recognized that a key to turning around the imprisonment rates of Maori is twofold, it is a battle to change state systems which have shaped and enacted historical and contemporary injustice, and it is simultaneously a battle waged in restoring the hearts and minds of those impacted by imprisonment. Our researchers worked with Maori community workers and a group of 35 Maori men and women coming out of prison. Over 2 years we interviewed them and we attempted to reconnect them to their iwi (tribal) history and iwi support. The initiative that we ran with iwi support was enormously successful. We worked with 35 Maori men and Maori women post release and although statistically 18 should have returned to prison within the first year, only four returned to prison. This article will look at what Maori researchers alongside of community workers and researchers did that enabled Maori men and women to successfully strengthen their lives, increase their understanding of their world, build support systems, and stay out of prison.

Kaupapa Maori Research

Te Atawhai o te Ao is a Whanganui-based Kaupapa Maori Research Institute. The research we undertook was undertaken from people from iwi that we belonged to. We are a Research Institute that is based within our own iwi (tribal) region, in our case within the Whanganui city. Within the broader district there are three main iwi groups with dozens of hapu or sub-iwi. These three main iwi groupings can, at times, work collaboratively. Staff within the Institute come from these three iwi groupings.

Kaupapa Maori research is centered in Maori views and understandings of the world. Maori values underpin all aspects of the research approach and links to the importance that Indigenous peoples place on relationships, reciprocity, and trust. Kaupapa Maori research is political research as it analyzes relations of power and seeks to benefit Maori communities.

For this project we worked with iwi-based community researchers both in the Whanganui district and in Waikato. This gave the research a particular kaupapa Maori (Kaupapa Maori is a Maori approach, a Maori way of doing something.) lens. Community researchers were highly knowledgeable about the different families, connections, tensions and at times could negotiate complex situations that could be completely overlooked by outsiders. They were also highly mobile and diverse in their contacts and able to work innovatively with often few resources but very good connections.

Underpinning the research was the question, what could we do to intervene in the current picture from our place in the world? When it comes to the question of prisons and imprisonment, unlike policy makers that tend to read the criminal justice system as being about bad people from bad families, we were seeing our own families, cousins, siblings, uncles, and aunties who in the ordinary world are for most of their lives doing good but who commit crimes. We are also seeing our relations being failed when their health needs such as addictions and mental health are not being adequately or appropriately dealt with. At times we are also seeing relations go to prison because of lack of support in the legal system and racial profiling. Where the crimes are extreme they are being disconnected from whanau (family) or are isolating themselves, but this group is relatively small. Clearly there are also allied issues that we are seeing such as literacy, addictions, mental health issues, early life and historical trauma (Walters et al. 2011; Wirihana and Smith 2014) that need to be addressed. As a result of the dislocation from iwi connections there are many families living in towns who have lost the connection to their own hapu (Hapu is a sub-tribe.). The participants discussed that freely in their discussions.

Why Are our People in Prison

There is an extensive literature that seeks to explain who goes to prison and why. The literature falls into two broad categories and it is important to understand the focus of this literature. One area examines the pathology of the individual and examines areas such as attachment theory, adverse childhood experiences literature, genetics, brain and development research, childhood trauma research, fetal alcohol research, and traumatic brain injury. This literature looks at the individual's life chances and tends to look at a lifeline of exposures to victimization and research that helps to address this. There is also literature that seeks to explain the social, economic, and environmental factors that impact on who goes to prison and why. This includes poverty research, state systems research such as state child care and protection research, victimization research, sexuality research, criminal justice system research, racism and inequalities research, and industrial complex research.

Indigenous research has intersected with all of the above because none of that research explains fully why the highest rates of imprisonment are for Indigenous Peoples. Indigenous researchers and writers are currently attempting to analyze the above writing as well as to emphasize the critical role of history in shaping Maori imprisonment rates and outcomes. Maori researchers have been focused on examining the criminal justice system, the reconstruction and institutionalization of whanau, the inequities and inequalities, constitutional and Treaty issues, and racism, particularly institutional racism. Institutional racism has long been challenged by Maori across many sectors (Jackson 1988). Ministry of Justice figures in 2015 show that when it comes to assault, 26.3% of Maori will be sentenced to imprisonment while only 13% of Europeans will be imprisoned for the same crime. Racial profiling of youth has been acknowledged even by Police Commissioner Mike Bush through

the acceptance of “unconscious bias” as a problem that needs to be addressed by police (2015).

Researchers have also made the links to the high numbers of Maori who have been abused in state institutions as children. Between the 1950s and 1980s over 100,000 New Zealand children were removed from families and placed into state care, and most of them were Maori. Many of them suffered abuse (Mulholland and McIntosh 2011). What is clearly shown in Indigenous critique is that Indigenous peoples are being criminalized in particular ways, that particular way is tied to the development of settler states.

The current population in the country shows that Maori make up 17% of the total population, 712,000 identify themselves as Maori (Statistics NZ 2015). One in three are under 15 years old. The Maori youth rate is growing and the numbers of Maori youth can be up to 50% in some primary schools. In 2015 only 69.8% of Maori remained in school to the age of 17 compared to 83.9% of the overall school population (Ministry of Education 2017).

Within New Zealand the Treaty of Waitangi signed with Maori tribes in 1840 has placed clear obligations in New Zealand to honor “tino rangatiratanga” (Maori sovereignty or chieftainship). Under current legislation Ministries are compelled to respond to Maori inequities. Because of the alarmingly high Maori incarceration rate a Treaty claim was taken to the judicial body, the Waitangi Tribunal, in 2016. The Treaty of Waitangi Tribunal claim led by Tom Hemopo, a former Maori probation officer collectively with three iwi, brought together the key Maori prison researchers in 2016 to present evidence against the Crown regarding inaction by governments to reduce the disproportionate number of Maori returning to prison. In 2017 the Tribunal released its findings:

We have therefore found that the Crown has breached the principle of active protection by not sufficiently prioritising the protection of Māori interests in the context of persistently disproportionate Māori reoffending rates.

... We have also found that the Crown has breached the principle of equity by not sufficiently prioritising the reduction of Māori reoffending rates.

... We have found that the Crown has not, at this point, breached the principle of partnership... We have found, however, that if the Crown does not live up to its stated commitment to develop these partnerships, it risks breaching its partnership obligations.

In the meantime, recent research by non-governmental social organizations show clear patterns of an entrenchment of poverty, which again Maori are highly represented in. Patterns of inadequate resourcing across critical support services creates a falling tower impact. Without adequate basic state benefit incomes, without adequate resourcing for children with physical health problems, without adequate resourcing for all mental health services, without adequate services for women’s shelters and domestic violence services, without adequate funding for schools to deal with high energy children or critical learning assistance or adequate training, with high class number sizes, with assessment regimes taking over teachers’ lives, without critical supports available for victims of sexual violence and many other key areas, key supports get taken away and pressure goes on families. In Aotearoa

these services have been hit hard in the last 5 years. Pressure on state services that daily deal with those in poverty are noting a rise in anger among their clients and in recent years, security guards are highly visible and regulate entry into government social security offices.

Higher rates of imprisonment are all known to be linked to changes in these sectors. This is set against a withdrawal of funding and adequate funding of services across many fronts, for example, counselling supports in schools, learning and behavioral supports in schools, pastoral care supports in schools, employment training opportunities, employment, adult literacy support, addiction support, mental health identification and support, crisis intervention support, and a multiple range of ways that supports need to happen. Furthermore, while services may be available, are they Maori services that can make the cultural connect to our people and their histories? There is advancement of whanau ora programs, developed and advocated for Maori that work with whole families proactively, and provide critical Maori community support services, but these services are underfunded.

There is also a massive literature on the failure of prisons. The people we interviewed were clear that prisons are a school for learning how to be a better criminal and they provide people with criminal networks. There are some rehabilitation type programs in prisons but the focus remains on punishment not restoration. Mental health problems are not treated in prisons except to contain and ensure safety. Prisons are not equipped to deal with the problems. We found high rates of Traumatic Brain Injury with resultant behaviors and emotional behaviors among the tangata ora but no treatment had ever happened. We also found high rates of sexual violence victimization, again with no treatment or support provided. Addictions research clearly points to underlying trauma as key to working with addictions, another issue that is only sparsely considered in prisons.

Early Prisons, a Military History

Public records do not acknowledge the history of the justice systems in settler states. Early prisons in Aotearoa were established predominantly for Maori. The first prisons were inside military stockades during land wars of the nineteenth century. Mass incarceration of Maori and photos of Maori prisoners were published throughout the country. As Maori subjection to the Crown and the removal of land progressed so too did the growth of prisons.

Incarceration of Maori is an area of history that is being revived through Treaty settlements. As each tribe compiles their own historical records, there is a reminder of the significant leaders and people who were captured and transported away from iwi regions. The first capital punishments, death by hanging, were Maori and these were public deaths, born of the need to publically punish, humiliate, and to subdue Maori who fought against the alienation of lands and the attempts to maintain self-rule. In iwi considered to be in rebellion, there are cases where Maori filled up the jails and were interred in caves, exiled on islands, and transported to other areas.

These early disparities on who was locked up in prison has not changed throughout time.

Maori lives and experiences are diverse and historically and inter-generationally the majority have been displaced from traditional lives, living, and knowledge. Historical trauma research shows that significant impacts accrue when you have a history of land dispossession, wars and its aftermath, being exiled, becoming refugees, widespread death through epidemics, language dispossession, racist treatment by institutions and for Maori families that has been sustained within the relatively short period of about six generations. The agency, resilience, coping strategies, fighting back, and the determination of Maori to survive as distinct people has also been ongoing.

The work of decolonizing and telling histories that account for Maori lives and ancestry will continue to be struggled over for many decades. Many Maori and Pakeha allies are challenging the ways that histories are told also but this is ongoing work to decolonize official telling and honoring of history.

While large numbers of Maori have had their connections to their lands disrupted, we have retained both knowledge of traditional lands and have retained our stake in iwi areas particularly through marae. We have remembered and do retell our own stories and basis of our beliefs through many forms of cultural expression such as kapa haka and art. But we also tell of the destruction and consequences on the people through the generations. If Maori have a hidden curriculum it has been sustained, fostered, and celebrated in the Maori language and in all forms of Maori expression, sometimes coded, sometimes overt for example in activism.

Introduction to the Project

This research project focused on the question, if you reconnected Maori men and women coming out of prison with their intergenerational connection to hapu (extended families) knowledge, the land, and the people, would that stop them returning to prison? We knew that once Maori are imprisoned, 60% are currently returning. So prison is a deterrent for only 40% (Department of Corrections 2008b).

Early on in the project we discussed naming our participants. We did not want to use the reductionist term “ex-prisoners.” We wanted an identity that affirmed them. Instead we used the name that a local health provider, Te Oranganui, was using – “tangata ora” which means people who are well or who are healing. The name recognized both humanness and their health. As we proceeded with the project we had to retrain others to relinquish the other terms they were using also such as “clients,” “ex-offenders.”

The Tangata Ora project informed a wider program of research, He Kokonga Whare which was funded by the Health Research Council of New Zealand, and examined Maori intergenerational trauma and wellbeing. In the Tangata Ora project we had gathered brief intergenerational biographies. We also sought to determine whether reconnecting tangata ora with their hapu through a series of interviews and wananga would reduce the likelihood that they would return to prison, and although

the small sample size used in this research means it is not possible to generalize the findings of this study to wider populations, there does appear to be a connection between tangata ora participation in the project and an absence of their return to prison. Where no connection existed, the project sought to establish whether reconnecting them with their Iwi roots could serve as a cultural protective factor in preventing their return to prison.

Using structured interviews and a series of wananga (gatherings) that included an exercise in visual ethnography, the research team initially interviewed 35 tangata ora and then conducted a series of wananga called hapu wananga. When a participant was identified a meeting was held with them to establish their circumstances, to talk to them about the research, to identify any issues with interviewing. For example, where it should take place, transport issues, timing, and other logistical issues. Early on in the contact we identified whether the person was connected to health and social services and if they were not we gave them the opportunity to receive that support.

We sought to identify those who had been released from prison who were from iwi in the central and lower North Island. We worked with hapu specifically because hapu is where the generational and land-based knowledge still resides, especially if your whanau is disconnected from the tribe. The reason for this was that on previous research projects we had found that it was common for there to be a breakdown in trust and communications with certain members of whanau. Restoring these relationships was important work that was long term and best done by local community workers. To that end we identified key health and social workers who would support the tangata ora long term at the beginning of the project.

Our goal was to connect the tangata ora with key hapu knowledge holders who would know the family name and could provide the generational and land history of the person. This was done through wananga and visits to different sites. Tangata ora would be able to share what they learnt with their whanau.

Recognizing the Differences Between Hapu and Iwi

Hapu are the land-based connected groupings that involve a collection of families. The Treaty of Waitangi was signed with the collective hapu of Aotearoa. Hapu are where marae and land interests and shared histories meet. The knowledge of sacred sites, the care of these sites, the care of marae and rivers and land sites, food gathering, and major decision-making about caring for land and the people occurs at hapu. It is hapu that keep the home fires burning, it is hapu that do the work to maintain customary history, knowledge, and daily practise. It is hapu and whanau that maintain marae.

Iwi are traditional entities that operated in a different way to hapu. Generally, they are the larger confederations, which shared dialect, iwi boundaries, and origins and knowledge. Jointly sharing iwi boundaries, iwi identifiers and in times of conflict iwi would become predominant for collective action. The Treaty of Waitangi settlement process has prioritized iwi governance entities. As a result this has brought together

hapu to work as iwi, whose work focuses on ensuring iwi rights and responding to the state.

Through Treaty of Waitangi claims within the country, most iwi are either currently fighting for land claim settlements or have moved through this process. Claims and settlements are currently engaging a great deal of iwi governance time and energy. Claims have completely changed iwi landscapes through reclamation of some lands, compensations, and knowledge bases. However the Claims process remains controversial because they cannot address the width and breadth of social and historical injustice. The parameters for settlement have been set by political expediency and perceived affordability.

Iwi Resurgence

Most research with Maori ignores iwi identification. We worked in three iwi districts. All three of these districts are in post settlement except for Whanganui. Iwi are increasingly pushing to get tribe-specific data from government agencies across a range of sectors. We were unable to get permission to work with the Department of Corrections in the research project and were unable to identify who was being released from prison that was connected to our particular tribe. We are not the only Maori researchers denied permission for research by Corrections. Corrections do not identify iwi affiliation, but Maori staff working inside the prisons commonly do ascertain this information. Although many iwi have Treaty of Waitangi settlement arrangements that entitle iwi to particular rights with Ministries and government departments, very few iwi have currently established clear relationships with Corrections. Within the regions that we worked, we found that iwi were struggling to have any sort of relationship with the local prisons or the relationship only extended to the occasional program being run by a iwi health or social service provider. This changed later in Waikato with the appointment of a iwi liaison worker.

The Practical Reality of Reconnecting People to their Ancestry

Within Aotearoa, we have knowledgeable people within each hapu and tribe who know the main families and descent lines of those families. If a person knows the names of their grandparents, from our hapu knowledge base we can often track and connect people. Some iwi, for example, Ngai Tahu, have gathered extensive records on their iwi people and assist people to find their ancestral links. Mostly this reconnecting is done through contacting key people within hapu. Maori services often work with these key hapu people but it is a very under-recognized network. In urban centers there can be several generations of disconnection. Many urban and iwi services assist clients to identify their tribe and hapu, if they are able to. Many services already recognize that whakapapa, where it can be tracked, is an important component to healing.

It took us over a year to find, meet, and recruit tangata ora into the project. We had to find a group who generally were lying low in the community and even within wider whanau it was not always known that they had been in prison. But further to this we had to identify and only recruit people who had particular iwi affiliations. Our community researchers used their extensive knowledge of networks, families, services, and a wide range of creative ways to identify and recruit participants into the study. Social media networks, gang networks, iwi radio, community workers were all activated to assist us to encourage people to contact us if they would be interested in participating in the study. If we did not have our community research networks this study could not have happened. In the end we had 35 that fitted the criteria. We worked for 2–3 years with each tangata ora.

Preliminary Interviews

In order to work with tangata ora we had to build trust, which took not just an initial meeting but several meetings and discussions with the community researchers. Community researchers remained flexible to be able to meet in homes, finding spaces for children, and organizing food so that they did not drain family resources. First interviews were over one and a half hours long and covered a range of topics. Interviews provided a rich and descriptive narrative of tangata ora lives; their connection to their history, culture, and language; their pathways into prison; and what they thought would improve their lives.

During these interviews we identified their knowledge of iwi connections. We also used screening tools for early life trauma and traumatic brain injury and a micro-aggression screen. We also had key health or social workers available to us throughout all stages of connecting with tangata ora so that we could ensure they had support and any follow-up that was needed. The screening tools were particularly revealing in identifying early and lifetime trauma. In the open-ended questioning of interviews, the women and men tended to normalize or underplay their own victimization experiences but the screening tools which asked for estimates of the numbers of times that they had been knocked unconscious, for example, and asked more specific questions, gave us more accurate information of the victimization rates. The screening often even surprised interviewees themselves when they had to count the number of incidents they had been exposed to. Most of the tangata ora that we interviewed scored highly on the traumatic brain injury screening tool that we used. As a result we gave copies of the results to the tangata ora and worked in collaboration with health workers to assist in any follow-up.

These interviews were particularly hard on the community researchers as they listened to tough stories. Although our community researchers were often knowledgeable community workers, they were hit hard by the stories they were told. The tangata ora whose early lives and treatment was poor as children was particularly difficult for the researchers. The exposures to physical and sexual violence at young ages and the attempts by children to cope and be resilient, only to have critical supports taken away, was heart-breaking to listen to. Stories abounded of children

who just wanted a safe home, who just wanted to stop being moved around and used as pawns, who just wanted to remain with that one loving person, who just wanted to stay with that one school teacher. We debriefed and reflected often.

What Tangata Ora Told us from their Preliminary Interviews

For all of the tangata ora, coming out of prison was a difficult transition unless there was supportive family waiting for them and a job that had been kept for them. Following release from prison, the majority of tangata ora were one step away from crisis. They struggled to make ends meet financially and could accumulate debt, they struggled to find housing or had tenuous housing, they had conditions that were difficult to fulfil with community probation or state benefits, they could be surrounded with unstable and volatile relationships. All of these types of issues left tangata ora living precariously, with the real possibility of a quick return to prison.

For the majority they came out of prison and went into a type of seclusion. With little money coming in and waiting for state benefits, they struggled. Daily life for many tangata ora after their release from prison consisted of long hours of being at home, fulfilling probation requirements, domestic duties, socializing, and other various activities to keep themselves occupied. Many reported difficulties in securing gainful and sustainable employment, and there was a sense of diminished worthiness arising from their inability to provide financially and materially for their families.

Some enjoyed the domestic routines, but almost all said they would have preferred to be in employment, making financial contributions to the running of their homes, and meeting the needs and desires of their partners and family.

They said prisons just helped them to be better criminals. Most tangata ora held their position that prison did not deter crime, and reiterated comments regarding prison as a “holiday camp” for some prisoners. Having said that however, when asked about violence in prison, they said that they were exposed and subjected to violence and in some cases needed to form alliances to stay safe. Also they commonly said they could access drugs and alcohol which enabled them to continue addictions. Most tangata ora told us that imprisonment did not help them to stop offending. Instead they said that while in prison, opportunities were there to be able to build criminal networks, and gather criminal intelligence for utilization in further offending when released from prison.

The importance of the right type of support. Tangata ora also told us that what helped them most upon release was support that remained consistent and long term, particularly supportive partners and family members. When it came to talking about what they thought would help them, they did say that spending time with people who had a stronger and more positive effect on deterring criminal offending made more sense.

They also felt they needed more connection and understanding of themselves as well as their cultural and ancestral roots. They needed good quality and culturally competent and considerate programs and services.

Barriers to their successful reintegration included the challenges of relearning how to maintain routine in their daily lives, discrimination, abstaining from negative influences, and the difficulty of changing old habits and associations. Some were also unable to identify and desist from poor decision-making that often led to criminal behavior, nor had the ability to make alternative decisions. These factors prevailed as a result of a lack of learning to make better choices and behave in socially acceptable ways when younger. Tangata ora also told us that the barriers to successful reintegration included lack of connection to their inner selves and their cultural and ancestral roots, the challenges they faced in meeting their release conditions, or their attitudes to doing so.

How they saw their identity. From the initial interview, we found that there was a range of connectedness to their Maori identity. We asked them how much they knew about their grandparents and further back in their own history. We also asked them about fluency in Maori language.

Several tangata ora were confidently able to recall back several generations of their family on both their mother's and father's side, but over half were only able to recall back as far as their grandparents, and sometimes only on one side of their family, as highlighted by this tangata ora:

Q: Just going back to your grandparents, do you know or did you hear anything about the generation before your grandparents.

A: Nah not really. See Mum's a South Island Maori, so she's from the South Island. The old man he was born in Taihape and they met down south, the old man was a Pakeha.

For some tangata ora they could not access information through their own immediate family:

In our family, you don't ask.

There were clearly areas of the past that tangata ora also preferred to cover over, and to not speak about or pass on to the next generations:

In my whanau, asking about the past is not ok.

This meant that they would have to actively go against their family in order to find out information and seek it from other sources.

Maori language connectedness. The responses provided by tangata ora illuminated significant diversity in cultural and ancestral knowledge and experience. There were those who reported growing up on marae and around fluent speakers of te reo, and who had been taught about their iwi ancestry from a very early age.

There were others who had very little knowledge:

Q: Have you learned any Maori language or do you know much about your Tribe?

A: Oh I picked it up. A little at a time. The Maori language you know, but I can't speak it fluently, I can't really translate it either, but I understand the basics. I know my tribe and my hapu.

There were also those who were interested in furthering their knowledge of their history:

Q: Do you have any interest or desire to engage with your tribe or do something for them?

A: I sure do. I want to take my boy back and yeah. . . .

Q: What does that mean to take your boy back?

A: To take him and show him around. I want to learn it first, so that I can take him and pass it down.

Did they have a connection to hapu? Only one tangata ora reported an active connection with their hapu and marae. The other tangata ora had little knowledge regarding their tribe, hapu, and marae connections, nor had they pursued further learning in te reo Maori. For some they signaled that it was a matter of confidence and knowledge:

Q: Have you made attempts to learn about your iwi (tribe)?

A: I have but not really.

Q: What would it mean to you if you did, or why haven't you?

A: I haven't just 'cos, I know where to start, it's just the means of getting there and the transport and time and who to go to, it could make a difference and you could meet whanau that I hadn't met before you know, some story that might resolve something.

What they told us about schooling. While many of those we spoke to had high rates of adverse childhood experiences, schools tended to operate imposing further punitive approaches. Schools lacked the ability to recognize or support these children whose home lives were fraught. When they did encounter a teacher who they felt they could relate to, they got moved on. Services were seen as punitive and blunt, in other words – the answer was removal of children, from classroom activities, from classes, from schools. Schools were unable to see the learning difficulties that some of these children had.

An allied survey that we undertook in the research looked at traumatic brain injury which for these children could be common, as could other learning challenges. Bright children tried to apply themselves in schools but failed through lack of support and consistency, through inability to get basic support to keep them afloat. Girls who withdrew into themselves were ignored, and boys were identified as discipline problems and were treated accordingly. Teachers did not inquire into the background of children, so hunger, the care of other siblings, lack of adequate clothing, stress, and other contributing factors that lead to inattention in class were ignored.

What they told us about racism and discrimination. Tangata ora reported discrimination as a daily impact. They reported common occurrences of being followed in shops, being targeted by police. Evidence released by police reports (Ministry of Justice 2011) shows the disproportionate numbers of Maori that are apprehended, disproportionate numbers on remand, charged and higher numbers receiving a sentence of imprisonment. Maori are more likely to be reliant on legal aid and to go to court with no lawyer. They are more likely to plead guilty to just get it

over with. They are less likely to have the literacy to deal with accumulated debt or fines. They also told us that they can struggle to fulfil complex bail, home detention, curfew, and probation conditions. They are considered to be less likely to “show remorse” in the court in the ways that non-Maori judges assume they should.

Wananga

Following the initial interviews, we worked to identify key hapu knowledge holders within the iwi that we were working with. That sentence sounds so easy but this was a big effort that could only be undertaken because we were already located inside iwi and knew how to do such a thing. We had to firstly identify the primary iwi and hapu that we were dealing with and activate our own networks to find the key people to talk to. This really involved knowing the people whose knowledge extended back through all the generations of a sub-tribe and in some cases to a whole tribe. Community researchers were invaluable in carrying out this work and the Institute used a wide and varied iwi knowledge base. All community researchers are involved within their own whanau, hapu groupings and several have held senior iwi positions so they were able to activate their own kumara vines.

Within the project, the hapu knowledge holders would need to have two meetings with researchers and hold two wananga for the tangata ora. Lastly the tangata ora were interviewed to ascertain their thoughts on whether reconnecting them with their hapu was an effective intervention in preventing their return to prison, their experiences of the Tangata Ora Project, their treatment by the research team, and any suggestions on what they think might improve future iterations of the project.

In the initial meeting we had with hapu knowledge holders we outlined the purposes of the project and also outlined the work they would be required to do. All of them were very keen to work with the tangata ora. We emphasized the need to pass on whakapapa (genealogical) knowledge as well as their own connect- edness. None of the hapu workers that we identified were commonly working with these particular whanau, although in some areas they are.

The primary role of hapu facilitators was to think about men and women coming out of prison to consider how they would reconnect them to their hapu knowledge. Because they were often facilitating reconnection in informal ways, we left it up to the hapu facilitators to decide how they would do this. We asked the hapu facilitators to identify the key historical events for the tribe and for the hapu before meeting with tangata ora. What was discussed was the ways in which the tangata ora connected to the hapu and what key historical events that happened within their hapu, and also stories connected to the land and people.

Unfortunately two of the tangata ora were returned to prison before they had gotten to the workshop.

The activities with the hapu facilitators definitely caused tangata ora to reframe their world. Hapu facilitators in wananga tended to seat people in a circle and always did karakia or whakamoemiti (prayer), mihi whakatau (welcome), waiata tautoko (song) to set the scene for the wananga. The wananga focused on connection and reducing

isolation by filling in knowledge of connectedness to the lands, rivers, and places they lived on as well as specifically showing them where they fitted in a much bigger and proud history. It also highlighted connection to each other and encouraged participation with marae and tribe, which was not there at the beginning of the wananga. Hapu facilitators could choose how they imparted knowledge, in some cases site visits and in others discussion, use of whakapapa charts, and a range of tools. Tikanga processes (correct iwi protocols) and hui (meeting) processes emphasize connection, sanctity, and a bigger picture to peoples lives which the hapu facilitators knew how to deal with. The ways in which the hapu facilitators gave information was diverse, from one to one games, to site visits, to more formal type discussions and meetings.

Wananga had a deep impact at a number of levels:

During wananga they were exposed to their deeper history, generations of connection to the seen and unseen connections to the lands, mountains, rivers all around them. Hapu facilitators gave them the understanding that their tupuna (ancestors) that they didn't know existed gave them the right to stand as tangata whenua tuturu not just as the self proclaimed urban-hard (Hapu facilitator).

Food was supplied in abundance at all wananga and leftovers were packaged for tangata ora to take home. In the aftermath of wananga during the cleanup time, the health worker was able to talk and offer support on a range of needs. It was at this more personal time that issues arose about seeking help and counselling.

We also found that hapu facilitators were often clarifying derogatory stories that tangata ora had heard about their own people, as well as clarifying the names of the places and stories of the ancestors.

This Town Is our Tribe

At the beginning of wananga, tangata ora were seeing themselves as strongly connected to towns or streets, "This town is our tribe."

As researchers, who were largely aware of their own iwi affiliations, we tended to view iwi identity quite simply, you are either Maori with a good knowledge of your tribe or you are not. This simplistic approach was challenged by our tangata ora. We assumed that they had "lost" knowledge of their hapu and they were living more as Pakeha. But we underestimated their existing knowledge. As one of the hapu facilitators noted after one wananga:

There was no doubt in my mind that they were more knowledgeable about Maori and connections than first appeared with their discourse on belonging and their application of tikanga in regards to that. A random discussion on the origin of carving was posed, with a contribution from all bar one to that discussion, demonstrating their knowledge of iwi variations to the origin (Hapu facilitator).

The difference in their knowledge was that it was not connected to their place of origin, their tribe. It brought a new found appreciation for those of us who are

connected to seeing the strength of our own people to hold on to our ways of being and snippets of knowledge under external pressure. As one hapu facilitator noted:

Self-descriptions were Maori but not tribe or hapu connected. The tangata ora stated themselves as ‘insert name of town – hard’. This meant that they knew their town, their relationship with the people in the town and how they fitted in their behaviour with each other. They had no doubts that they were born and bred from their town. They strongly asserted their Maori identity but in a form that they created. They held tangihanga (traditional funerals) in homes; they would lay down hangi (traditional cooking) for important occasions, operating semi marae in garages and at their homes (Hapu facilitator).

They were also clear that there were some things they were not going to change and hapu facilitators did not challenge that aspect of their identities but rather built on their knowledge and corrected misinformation:

They were clear that no one was going to take away from them the modern sense of their belonging. But they would learn missing layers of history that they should think about as being there too as an expression of belonging now that they know (Hapu facilitator).

Within towns they could be all meeting at tangihanga (funerals), for example, and not understanding that they were related or how. Maori families created support networks in town but also did not know they were actually related, even when they were living within their own traditional iwi areas.

The biggest impression was made on tangata ora when site visits were made to places of historical significance, and they could hear the stories of their ancestors at those places. Several disclosed having visited these places before, and were not aware of their cultural connection to the sites visited:

A: Yeah up to the maunga (mountain); yeah that’s the first time. In my childhood we used to go up to that hill every day because it was the school bus run. But the mountain I have never known and never seen it because we had never gone that far. It was only like only another 500 metres away.

Q: From where you went every day?

A: Yeah and so the historical significance of that area, now that I’m 40 it’s like. . . and look what I can see with my eyes; you saw everything – east, north, south and west. It was a buzz.

Another tangata ora:

Yes. That was the first time I’ve ever been there and heard about that kaupapa and about that rangatira (chief). Then you’re looking over and then ‘churrrr’. Mean!

Q: So you’re saying you would travel along that road and not even be aware of the history until then?

A: Yeah, cause I always go out there to fish. Plus my brother died up the road from there.

Tangata ora also felt that the topics discussed during the wananga provided new insights to their culture and ancestral roots for those with little or none prior, and for others, built upon knowledge they already had, with this increase in knowledge manifesting as improved self-esteem and confidence, gained through knowing more about who they were, and where they came from (Quince 2007).

Most tangata ora reported that they had found the wananga useful as it improved knowledge of cultural and ancestral origins and they felt it would be helpful for others coming out of prison to learn. They also felt that hapu and marae would provide tangata ora with more support upon release and a wider network of support.

Wananga issues that arose. The holding of wananga with tangata ora was not without challenges. While Maori protocols and environments can mediate potential conflict, we knew that some tangata ora had affiliations to opposing gangs. Processes were undertaken prior to the wananga to ensure that these matters were not the primary issue on the day. In some cases, mediation was done prior to the wananga or addressed openly in the wananga and explanations given of what the kaupapa was. What did happen, however, was that new understanding of connections emerged across the lines, that while gang affiliations and rivalry might be there, a deeper longer connection was revealed in the wananga, of many generations and a common shared history. Tangata ora set aside most of their differences when participating in the project, and some still talk since the project has ended. This is an extremely positive development arising from this research, and demonstrates the possibility that when it comes to culture, gang affiliations do not need to inhibit progress (Desmond 2011). Also one of the hapu facilitators found out that her home had been burgled by one of the tangata ora of the wananga. This was known prior to the wananga, and was addressed in a Maori way by discussing clearly what the learning space was about. The tangata ora and the hapu facilitator mediated, and this cleared the way for the wananga to proceed.

Second Wananga

At Wananga two, reconnection went to another level as tangata ora were each individually shown their own connections through whakapapa charts and discussions about their whanau. One participant spent most of his time reading a Manawhenua report (<http://www.ngatiapa.iwi.nz/downloads/manawhenua/Ngati%20Apa%20Manawhenua%20Report%201998.pdf>), and as a result he was gifted the report. This report had his whanau names in it, and this was his first time discovering his whakapapa.

Their hapu was identified and all but one were connected to the land they were currently living on. They were given the hapu name and shown how through whakapapa they connected so well:

You are on your land, here through this hapu, you are a descendant of this hapu.

This land is my land.

You belong here in a modern sense.

You belong here in an ancient sense.

In ancient times we lived here, and we still live here. You are the Ahi Kaa.

Marae aren't in here in this town any-more, but our stories are (Hapu facilitator).

Hapu facilitators emphasized ancestry, but also the sanctity and importance of people. The sanctity of women as connectors to the land, and men as connectors to the sky. They explained how these ancient stories give us guides for living today, and that this pathway for correct living was created for them and is ancestrally created.

Tangata ora enjoyed meeting others from their hapu, some of whom they had known previously, but had not realized they were connected through hapu as well. There were also reports regarding the positive benefits of participating and sharing in the hapu wananga as a group, indicating the group-based nature of the hapu wananga made the experience much easier to engage in and, for most, more enjoyable. In the main, most tangata ora reported participating in the Tangata Ora Project because they were asked to, but two tangata ora reported participating as they felt they had knowledge and experiences to share that they hoped would benefit the project.

Tangata Ora Voices

Q: What went well for you during that wananga?

A: They pulled out all of the whakapapa and put it on the table. Because I hadn't really tried to delve into my father's side of whakapapa. I know my dad and his dad and then my koro's dad, and then my koro's dad's dad. I know as far back as there.

Introduced into this Wananga was photovoice. Each tangata ora was given a camera to record their perspectives and observations of hapu. They were asked to bring 10 photos that they had taken to the next gathering. They could choose any topic they liked.

How Tangata Ora Responded to Wananga

Most tangata ora reported that working in groups during the wananga was helpful, as some were not confident engaging with or speaking in front of others, so being a part of a group helped them build their confidence watching others engage and speak, until they were ready to do so themselves. One tangata ora spoke of how the project connected her with people she would have never spoken to in the past, and how she had continued to speak with those people after the wananga.

Most tangata ora expressed appreciation for opportunities to talk about and share their experiences and stories with others, with one reporting how liberating talking about her past had been for her, and was helping her come to terms with a few things, and begin to move on from them. They also expressed appreciation for the koha they received from the project team for their participation in the project.

Some tangata ora felt that their priorities had changed since participating in the project, with one disclosing a significant reduction in domestic violence in her home, and others reporting they considered their families as treasures, with one spending

more time with her children, and another dedicating all their spare time to working on regaining custody of their children who were in the care of others.

Effectiveness of Tangata Ora Project and Wananga in Reconnecting Tangata Ora with their Hapu

There is obviously an interest in learning about one's cultural self, perhaps this is something that should be considered by hapu themselves to develop and deliver, as it is them after all, who are the rightful teachers of this knowledge (Bishop 1998).

Impact of Increased Knowledge Regarding Hapu on Rates of Reimprisonment

Since participating in the project and the Wananga, none of the tangata ora involved in the post-wananga interviews had returned to prison. When queried about why they thought this was, some tangata ora felt that their involvement in the project had made them stop and think about the way they were living their lives, and the things that were really important to them, with some deciding crime and going to jail again was not important, but being around for their children, grandchildren, and families was.

Q: So do you think you will go back to jail?

A: Nah

Q: What do you think the main reason for that would be?

A: Knowing there's someone there I can turn to and treasure my family more and my grandson; cause we got him before and I didn't know who to turn to or who to talk to. I was just like in four walls, and either you take it or I didn't know what to do. I'd been going to jail since 2009 till last year and I haven't been back

And this from another tangata ora:

Q: Why do you think it's not useful to learn about your ancestral roots?

A: You should learn; you should learn it actually, your ancestral roots so you can pass it on to your kids and to their kids

Despite the significant advances made regarding a sense of connection to their tribe and hapu, and despite the reported effect their involvement in the Tangata Ora Project had on their views of themselves and the things in their lives that were worth staying out of prison for, some tangata ora remained uncertain about their ability to desist offending in future, and others were even less certain about their possible reimprisonment, as reported by this tangata ora:

Q: Do you think you will go back to jail?

A: That's the million dollar question. I don't want to go back and I have said this like a million times that I don't want to go back. I have changed my thinking and I have changed

some of my lifestyle options. I have stopped addictions and some bad behaviours, so I have got a very high chance of not going back to jail

All of the tangata ora disclosed aspirations not to return to prison, but the sense this was not always in their control remained.

Conclusion

This project focused on the wisdom that exists within our own communities. What do our people say helps to strengthen our own people? Whether we are teachers, health workers, probation officers, prison workers, social workers, business owners, we are often engaged in connecting and reconnecting our people. Does that notion help to intervene in the growing tide of Maori imprisonment? This project worked with those people who had the knowledge base and could reconnect tangata ora with a deeper sense of themselves and their place in the world. At a practical level it gave the potential for new support systems to be there for tangata ora as well.

While we found a population that was one step away from crisis on a daily basis, the project did change these men's and women's expected outcomes. The parallel work of providing hapu, iwi health, and social services support alongside of wananga about hapu worked in this situation.

From an iwi perspective, iwi are attempting to increase participation by their own people. But sometimes this work needs to be actively facilitated. We also found that disconnection from iwi can happen within the traditional iwi land areas, but this disconnection can also be remedied if groups who are bound by shared history and connection are brought together.

When it comes to health and social services delivery, policy makers need to understand that reconnecting to a service that is tribe- or hapu-based is a lifelong connection that is made, not a connection for the term of a contract. Iwi membership is bigger than a service provider and will endure and continue.

We also learnt that our strength and resilience to hold on to identity is fought for fiercely in urban contexts and this creates new identities. New formations for Maori identity are created, and these need to be understood from the iwi perspective in order for connections to remain.

For tangata ora the hapu facilitators reminded them of the importance of knowledge and that they were all a part of a large and powerful interconnected network of iwi tangata, with strong family bonds to each other, and to the land from which their people came. Their involvement in the Tangata Ora Project reconnected them to each other and gave them an opportunity to reflect on what was really important to them, in ways many of them may not have had the opportunity to do so for some time. It was very clear by the end of the project, what was important was their families and their culture, demonstrated both through the absence of a return to prison for those tangata ora interviewed, and their reports of positive and useful experiences from their involvement in the project.

This project reaffirms that while the prison system remains in its current form, providing the right type of support post release is critical and can intervene in recidivism. That support needs to be consistent and long term, with people who have a strong and positive effect in their lives. This project met those two needs by providing iwi-based health and social service support, combined with key hapu facilitators. Both these supports mean that tangata ora have potential lifetime support that goes beyond the life of a service contract. Both these supports provide culturally solid, potential lifetime support which do enrich the lives of the tangata ora.

This project caused changes not only for tangata ora but to everyone involved. Everyone on the project was related to one another, these relationships have just been reactivated and remain a potential lifetime network. We remain deeply indebted to all those who agreed to participate in the project. You will never be forgotten.

Glossary

Aotearoa New Zealand, Māori term for New Zealand.

Hangi Earth oven to cook food with steam and heat from heated stones.

Hapu Kinship group, clan, tribe, sub-tribe, section of a large kinship group and the primary political unit in traditional Māori society. It consisted of a number of *whānau* sharing descent from a common ancestor, usually being named after the ancestor, but sometimes from an important event in the group's history. A number of related *hapu* usually shared adjacent territories forming a looser tribal federation (*iwi*).

Iwi Extended kinship group, tribe, nation, people, nationality, race, often refers to a large group of people descended from a common ancestor and associated with a distinct territory.

Kai Food, to eat, to consume, feed (oneself), partakes, devour.

Kapahaka Māori Performing Arts, performance, Māori song/dance.

Karakia/Whakamoemiti Prayer, to recite, or chant.

Kaupapa Topic, policy, matter for discussion, plan, purpose, scheme, proposal, agenda, subject, program, theme, issue, initiative.

Koha Gift, present, offering, donation, contribution, especially one maintaining social relationships and has connotations of reciprocity.

Koro Elderly man, grandfather, grandad, grandpa, term of address to an older man.

Kumara vines Maori lines of networking.

Manawhenua Report This report has been commissioned by Te Rūnanga o Ngāti Apa as part of their preparation for presentation of Wai 265, the Ngāti Apa land claim before the Waitangi Tribunal. The purpose of this report is to provide a definition of the nature and extent of Ngāti Apa manawhenua. This report is a component of the overall research and reporting project currently underway as part of Wai 265.

Māori Indigenous New Zealander, indigenous person of Aotearoa/New Zealand.

- Marae** Village, communal village, courtyard. The open area in front of the *wharenuī*, where formal greetings and discussions take place. Often also used to include the complex of buildings around the *marae*.
- Maunga** Mountain, mount, peak, sacred hill.
- Mihi Whakatau** Speech of greeting, official welcome speech, speech acknowledging those present at a gathering.
- Ngai Tahu** A tribal group in the South Island of New Zealand.
- Pakeha** New Zealander of European descent, English, foreign.
- Rangatira** High ranking, chiefly, noble, esteemed.
- Taihape** A town located near the middle of the North Island of New Zealand.
- Tangata Ora** People of wellness (literal translation). People who are well or who are healing. Term used for men and women who have been released from prison.
- Tangata Whenua Tuturu** Original People of the Land.
- Tangihanga** Traditional Māori Funeral.
- Te Reo** The Māori language.
- Tikanga** Māori traditions and protocols, correct procedures, customs.
- Treaty of Waitangi** A treaty first signed on 6 February 1840 by representatives of the British Crown and various Māori chiefs from the North Island of New Zealand.
- Treaty Settlements** The settlement of historical Treaty of Waitangi claims.
- Tūpuna** Ancestors, grandparent(s).
- Waikato** Region in the upper North Island of New Zealand.
- Wānanga** To meet and discuss, deliberate, consider, seminar, conference, or forum.
- Whakapapa** Genealogy, genealogical table, lineage, descent.
- Whānau** Family, extended family, family group.
- Whānau Ora (Programmes)** A key cross-government work program jointly implemented by the Ministry of Health, Te Puni Kōkiri, and the Ministry of Social Development.
- Whanganui** City in the lower North Island of New Zealand.

Abstract

This chapter celebrates Indigenous education movements in Thailand. Despite state attempts to homogenize its citizenry historically and today, Indigenous communities in Thailand have always been active in strengthening their family, cultural, and linguistic practices. Through connections to other Indigenous movements regionally and globally, Indigenous educators in Thailand are organizing what we call “moves to resurgence” in communities, in schools, and particularly in the in-between spaces across schools and their local communities. In this chapter, we provide an overview of (1) the history and construction of indigeneity and ethnicity in Asia that complicates a “white-other” binary, (2) the long-term impacts of schooling for Indigenous youth as it relates to the formation of nation-states in Southeast Asia, and (3) how Indigenous communities in Thailand have skillfully navigated across worlds to create coherent identities for themselves. We provide three cases that intentionally build innovative “both-and” constructions of identity and resist binary state narratives that attempt to place Indigeneity in contradiction to statehood. To resist the continued erasure of Indigenous peoples in Asia, we highlight case examples of Indigenous resurgence and celebrate Indigeneity in Thailand.

Thailand · Education · Indigeneity · Indigenous movements · Indigenous identity · Indigeneity in Asia

Introduction

Distinct linguistic and cultural groups in Thailand have existed long before the formation of the nation-state. Since the 2000s, these communities have been advocating for the rights to play a larger role in the education of their children and mediate long-term impacts of national compulsory education. Until recently, Indigenous highland communities have not been allowed to engage in a process of self-identification and self-determination. This was exacerbated by a system of national compulsory education that left little room to value and celebrate non-Thai practices, languages, and identities. The long-term impact of schooling initiatives that are implemented in the rural mountain villages or initiatives to bring highland youth to lowland schools continue to be felt today through the devaluation of Indigenous practices and the loss of their own culture and languages. While schooling has “reshaped local worlds” (Keyes 1991), this often ignores the agency of Indigenous people who have been setting up systems of learning to shape their own worlds.

This chapter explores how Indigenous communities are moving beyond state constructions of identity, ethnicity, and borderlands to build networks of learning movements for Indigenous education in Thailand. For those that call Thailand’s borderlands home, highland communities have built and led movements of Indigenous people that are purposely collaborative and necessarily transborder. Despite not

being officially recognized as Indigenous by the Thai government, highland leaders have been engaging in a process of self-definition to recognize themselves and their national movement as Indigenous peoples of Thailand. As scholars who have been active in these movements, our chapter outlines first, the political nature of self-definition in relation to state policies. Second, we explore the long-term impacts that schools have had on Indigenous highland identity and knowledge systems; participation in national compulsory education has often resulted in the erasure and devaluation of Indigenous knowledge and identity. Finally, we focus on Indigenous moves to resurgence and how Indigenous people have been acting to promote their own systems of knowledge and languages that bridge the formal school system and the larger community.

The concept of indigeneity is only just being recognized in Asia and is thus complex for schools and communities (Erni 2008; Baird et al. 2017). This chapter highlights how Indigenous communities navigate this complexity to build coherent identities for themselves despite ongoing state efforts to essentialize and place national and Indigenous identities in opposition to each other. We provide cases of Indigenous resurgence that creatively connect and advance state and community learning systems to build Indigenous power in the context of state nationalism in an increasingly globalized world. This chapter expands current notions of indigeneity by resisting the erasure of Indigenous communities in Thailand and highlighting interracial, national, and global dynamics that are common to Indigenous communities in Asia.

PART I: Ethnic Diversity of the Indigenous Peoples in Thailand

Who Are the Indigenous People of Thailand?: Names and Meanings

Unlike the new settlement and former colonized countries, Thailand had never been colonized by European forces. However, as a modern nation-state, the geo-body of Thailand was created by the influence of European colonies and the modern technology of cartography (Thongchai 1994). Initially, the country's name was "Siam" and this was changed to "Thailand" in 1939, due to the mainstream of Tai speaking groups. Other non-Tai speaking groups who are Indigenous groups in Thailand then became ethnic minorities, or the "others within" (Thongchai 2000a). Among those were more than 60 dialect groups throughout the country and 10 highland ethnic groups were labeled "hill tribes" or ชนกระเหรี่ยง (*chao khao*) in Thai, the Karen, Lua, Hmong, Mien, Lisu, Lahu, Akha, Khamu, Htin, and Mlabri (McCaskill et al. 2008). In a survey by Mahidol University's Institute of Languages and Culture for Rural Development that continued from 1993 to 2001, 62 languages were identified throughout the country – 24 Tai languages, 22 Austroasiatic languages, 11 Sino-Tibetan languages, 3 Austronesian dialects, and 2 Mien-Hmong (Leepreecha in press). The state government then set up specific socioeconomic development projects directly toward developing these "hill tribes" (McCaskill and Kampe 1997); the mountain borderlands of Thailand were problematic, a site of intervention

(McKinnon 2004). Since the mid-2000s, young leaders from these groups joined the international movement of Indigenous peoples in other continents and set up the Network of Indigenous Peoples in Thailand (NIPT). Despite there were national movement and adoption of United Nation Declaration on Rights of Indigenous Peoples (UNDRIP) in 2008, the term “Indigenous people” has been rejected by the Thai government who state that the highland people of Thailand are “not considered to be minorities or Indigenous peoples but as Thais who are able to enjoy fundamental rights and are protected by the laws of the Kingdom as any other Thai citizen” (Erni 2008, p. 444).

In the Thai context, labels are often ascribed to Indigenous highland communities without them having much say in their own identity or the process of self-definition. These ethnic groups are referred to by many other names instead. Most commonly, the highland communities are labeled hill tribes or ชาวเขา (*chao khao*) – literally translating to people of the hills (Laungaramsri 2003). The label “hill tribe” did not come from a process of self-definition, but from a way for the Thai officials and foreigners to contrast those who lived at 10,000 ft over sea level to those commonly classified “Thai” or lowlanders (Theerawhekhin 1978, p. 68, as cited by Laungaramsri 2003). *Chao khao* can also mean “the other people” as opposed to ชาวราบ (*chao rao*) or “the us-people” referring to the central Thai people as “us” (Laungaramsri 2003). The term “ethnic minority” ชนกลุ่มน้อย (*chon gloom noi*) is another label used to distinguish this group in opposition to the Thai majority in the country (Burutphat 2518). Another term is “ethnic group” กลุ่มชาติพันธุ์ (*gloom chat ti phan*), which has been used by scholars to refer to groups of people who are not part of the mainstream. This term is broader and has more positive associations than the “hill tribe” or *chao khao* label, since it includes every cultural group throughout the country, regardless of the length of time they have settled in Thailand.

Ethnic Diversity in Thailand

The Indigenous community has been classified by linguists, historians, and anthropologists (See Fig. 1a, b for maps of Southeast Asia). However, according to the National Council of Indigenous Peoples in Thailand, there are 42 different non-Tai Indigenous groups with a total population of 4,282,702 people have united under this movement (Samnakngan Chonphao Phuenmuang Haeng Prathet Thai 2558, as cited in Leepreecha [in press](#)). In addition to the Thai speaking groups, other native groups in Thailand include the Mon, Karen, Lua, Shan, Lao, Kui, Khmère, Chong, Munnì, Malayu, etc. Ancestors of these groups have lived in Thailand for generations. Meanwhile, there are many groups whose ancestors moved into Thailand before the emergence of the modern Thai state between late nineteenth to early twentieth centuries. These include the Chinese, Phuan, Lue, Laos (from Laos), Hmong, Mien, Khamu, etc. There are also groups who have migrated into Thailand a couple of decades ago – the Lisu, Lahu, Akha, Dara-ang, Vietnamese,

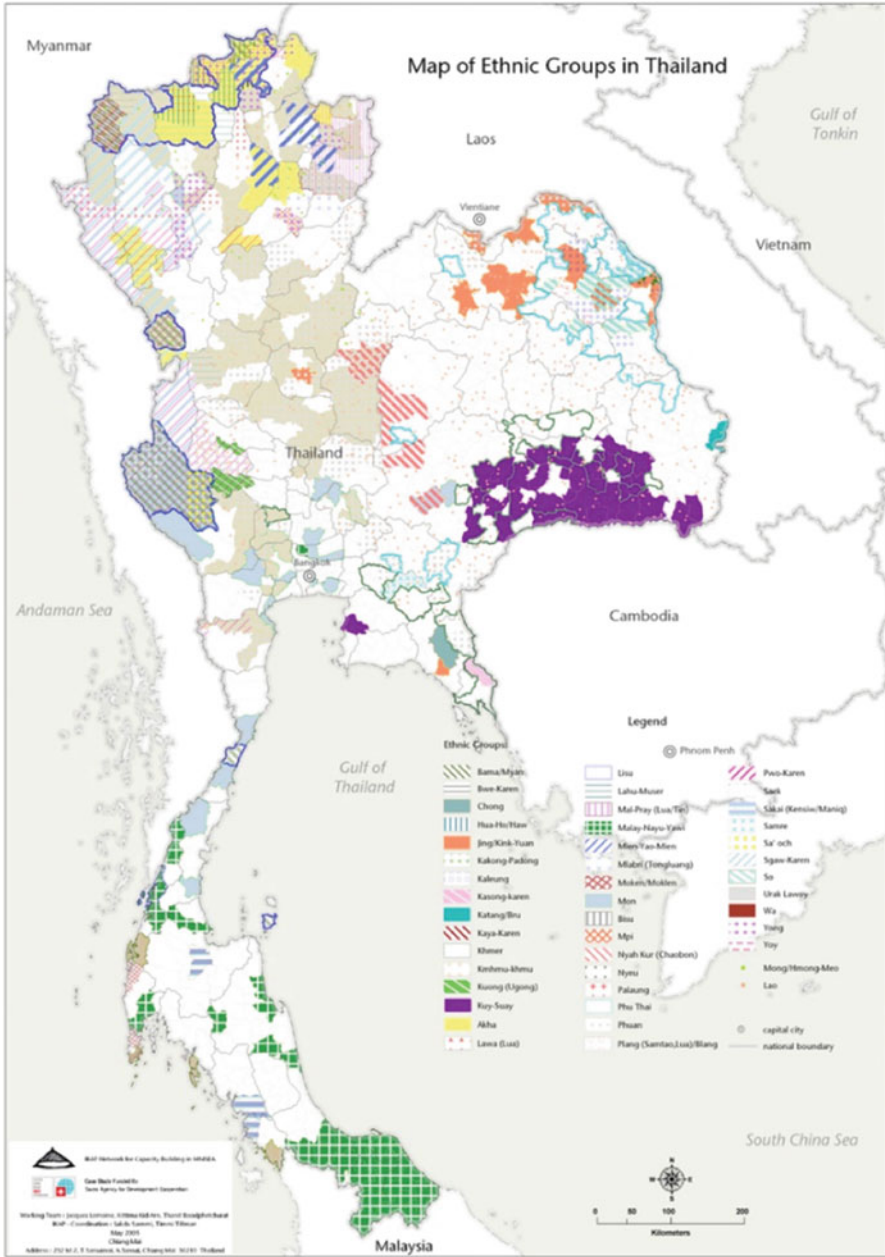

Fig. 1 Distribution of ethnic groups in Thailand (Indigenous Knowledge and Peoples Foundation (IKAP), Chiang Mai)

among others. There is a variety of ethnic groups who have settled in Thailand from different time periods. However, unlike other neighboring countries, the Thai government never surveyed or recognized these ethnic groups but only attempted to assimilate them and make them become Thai. Only in the past decades did the state government register and classify peoples who lacked Thai citizenship into 19 groups and issue different temporary colored cards for them (Laungaramsri 2014). These classifications, however, were based on citizenship concerns and ethnic diversity was never seen as part of the Thai state.

Among those ethnic groups, the “hill tribes” which comprises of ten highland ethnic groups in Northern Thailand became the prominent, due to increasing national security fears that the Thai government believed the “hill tribes” caused. This fear oriented, around 1.2 million peoples much of the government’s policies toward highland groups during 1960–2000s. As stated above, while some groups are native to the land, and while others settled in Thailand for one to two centuries, and yet other groups have migrated into Thailand decades ago, these 10 groups were categorized “hill tribes” and portrayed as recent immigrants (Young 1961) (Fig. 2).

Despite these labels, through the creation of Indigenous networks and after external and internal debates, this group has chosen to call themselves Indigenous people, *ชนพื้นเมือง* (*chon pheun mueang*) or *ชนเผ่าพื้นเมือง* (*chon pao pheun mueang*) or literally “people of the land.” The term *chon pao phuen muang* (*ชนเผ่าพื้นเมือง*) was agreed upon and adopted by the committee members of the National Council of Indigenous Peoples in Thailand (NCIPT, *สภาชนเผ่าพื้นเมืองในประเทศไทย* in Thai) during the October 31, 2558 (2015) workshop at Inter-Mountains Peoples Education and Culture in Thailand Association (IMPECT) in Chiang Mai, Thailand (Leepreecha [in press](#)). The NCIPT states in a proposal that was submitted together with the act for the National Legislative Assembly, that,

Indigenous communities, peoples, and nations are those which, having a historical and social continuity before the establishment of present nation-states, consider themselves distinct from the main society. They are not the dominating group in the nation-state and are determined to preserve, develop and transmit their ancestral territories, their ethnic identity, and their language for future generations. These are basic of their continued existence as peoples, in accordance with their own cultural patterns, social institutions, and legal system for living peacefully with other groups in the nation-state society (Samnakngan Chonphao Phuenmuang Haeng Prathet Thai 2558, p. 1, as translated by Prasit Leepreecha)

This shift in words and who decides its terms of use is central to contemporary Indigenous movements. Ethnic categorization and identification in Thailand have historically been an outsider’s one. Indigenous leaders thus responded to the need to self-define and self-identify. They began a transition from using the label of “hill tribe,” which has been a term used by outsiders during the 1950–2000s, to “Indigenous peoples” (Leepreecha [in press](#); Morton and Baird [in press](#)). Choosing to claim Indigenous status for themselves allowed Indigenous leaders in Thailand to connect with Indigenous people’s movements globally and find solidarity with other communities who share similar struggles (Morton and Baird [in press](#)). Laungaramsri

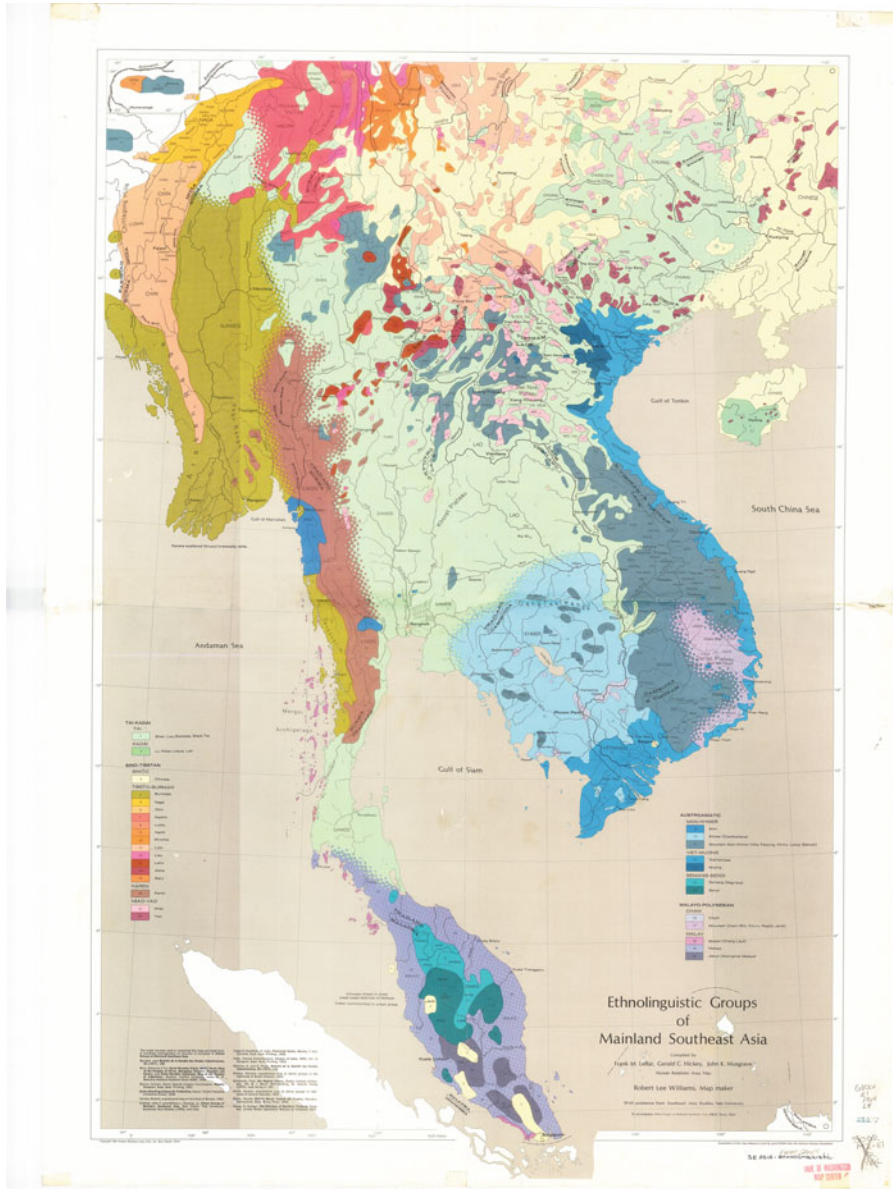

Fig. 2 Map of Ethnolinguistic Groups of Mainland Southeast Asia 1964, Human Relations Area Files

(2003) writes that “Ethnic categories in the modern Thai nation are, therefore, not simply constituted by shared/common identity but represent a powerful instrument or confinement and control by the modern state. At the same time, ethnicity is by no means an immediate given but is constantly achieved/ created through a process of

negotiation” (p. 157). This process of negotiation is at the center of debates over Indigenous rights in Thailand.

Even though Indigenous communities in Thailand have participated in Indigenous rights movements internationally, they are not allowed to claim Indigenous status, nor have claimed to such a status translated to authentic meaning for their peoples (Network of Indigenous Peoples in Thailand 2010). Central Thais also claim indigeneity to Thailand, and the positionality of the Indigenous peoples in relation to Thai society is still contested (Erni 2008). The use of the label “Indigenous peoples” lies at the heart of the politicized citizenship debate for highland communities in Thailand and their rights to control their educational experience.

Thailand boasts of its distinct linguistic and cultural groups, but outside of tourism, diversity is often seen as a threat to a monocultural Thai national identity and thus the unity of the country. This next section explores how highland leaders created an Indigenous network to garner strength as a “community of becoming” (Leepreecha *in press*) – a community that is constantly making and remaking itself and what it means to be Indigenous in Thailand today.

Indigenous Movements in Thailand

Indigenous people in Thailand have always been engaged in the process of self-definition and in 2007, a transIndigenous movement in Thailand solidified. The global flow of ideas and connections to international Indigenous alliances promoted leaders to form the Network of Indigenous Peoples in Thailand (NIPT) to give voice to Indigenous issues in Thailand (Leepreecha *in press*). Through this network, Thailand celebrated Indigenous Peoples’ Day for the first time in 2007 (Rattanakrajang Sri 2014) and this public event has been organized every year since. From 18 groups in its inception, the network now has 35–57 active groups from across the country (Leepreecha *in press*). This network (originally made up of mainly highland communities) has steadily grown in strength to include lowland minority groups as well. The Network of Indigenous People in Thailand is organized loosely with an internal coordinating body, IMPECT, as its secretary office to serve as a liaison between Indigenous representatives throughout Thailand, and an external arm, the National Council of Indigenous Peoples of Thailand (NCIPT) that was founded in 2010 to aid with external coordination to NGOs, government offices, and international organizations (Leepreecha *in press*). NIPT has led legal reform initiatives in the National Legislative Assembly and also the nation’s participation in the UN permanent forum on Indigenous issues (Leepreecha *in press*). NIPT is slowly gaining voice and power in civic society. The NIPT has created media, statements, books, and increased public awareness of Indigenous issues in broader Southeast Asia.

However, representations of Indigenous highland people as dangerous or in conflict with the nation-state continue to make it hard for many to be fully participating members of Thai civil society or for Indigenous communities to control their own education (Hyun 2014; Keyes 2008). Even though Thailand voted in favor of

and ratified the United Nations Declaration on the Rights of Indigenous Peoples in 2008, they argue that every group in Thailand, including the Thai, is Indigenous. Today, there is still no clear policy regarding Indigenous people in Thailand or definition of Indigenous people, and it is mostly the work of scholars and nongovernmental organization (NGOs) that try to define the terms and meanings. The Network of Indigenous Peoples in Thailand has joined and now alliances such as the Asia Indigenous Peoples' Pact, Network of Indigenous Peoples in Thailand, and the International Working Group for Indigenous Affairs have come together to advocate for the rights of Indigenous peoples across borders. Comprising villagers, elders, Indigenous scholars, and NGOs, the NIPT works on the issues of Indigenous rights to land through community land titles, access to forests homelands and natural resources for food sovereignty, and protest the lack of citizenship for undocumented Indigenous people who were not counted as part of the national census in the early twentieth century and remain stateless. According to a 2008 UNESCO survey, 38% or 380,000 highland Indigenous people still lacked citizenship and only had a "hill tribe" status card (Calderbank 2008).

Initiatives to actively build and strengthen Indigenous identity and knowledge systems through education have also been at the forefront of NIPT and IMPECT's work. Groups such as the Indigenous Education Network, Pestalozzi Children's Foundation, IMPECT, Ton Kla Youth Network (TKN) and Foundation for Applied Linguistics have organized events and projects to protect Indigenous languages. For example, Foundation for Applied Linguistics is embarking on a 4-year project from 2559–2562 (2016–2020), to include of Indigenous studies as part of their strategic plan (Indigenous Education Network, 2559). To engage the public, these groups and scholars also use media and literature to circulate Indigenous perspectives on identity that shift public opinion on highland communities.

Educational initiatives that safeguard Indigenous identity are deeply political in nature as the purposes and practices of schooling for highland communities in Thailand have often limited the ways that Indigenous youth can define themselves. Schools are tangible and powerful forces that have often devalued and erased Indigenous identity through the state-disseminated texts and assessments (Keyes 2008; Goodman 2013). We now turn to how colonial mapping and school as a technology for nation-state building have framed how Indigenous youth and communities imagine who they can be.

PART II State Education to Build a Nation – The Impact of Thai Government Policy Toward Indigenous Youth and Communities

In Siam, the negotiation of kingdom boundaries made school an important tool in the formation of the nation-state. The Kingdom of Siam was a multiethnic kingdom where diverse groups lived and worked (Thaweessit and Napaumporn 2011). In order to maintain the sovereignty of their lands during the height of colonialism, central Siamese leaders were pressured by the French and British to map undefined and porous borders of the kingdom in the quest to create a nation (Thongchai 1994).

Furthermore, in an effort to unite the newly imagined geo-body and prevent the fragmentation common to the premodern states, Siamese leaders undertook nation-building projects to demarcate both a territory and a specific population that would belong to the newly forming nation-state (Thongchai 1994).

After the British waged war with the Burmese in the 1850s, they began to negotiate borders with the Siamese to distinguish British and Siamese domains. In response to the threat of colonization, Bangkok troops were tasked with mapping officials under King Chulalongkorn's instructions to "know all the localities under his sovereignty" (Thongchai 1994, p. 121). For the Siamese leaders, modern geography was "the only language the West would hear and only a modern map could make an argument" that would establish the geo-body of Siam. For the first time ever in Southeast Asia, mapping was used as the technology to establish this new geo-body. As Thongchai says, "the geo-body of Siam was being created literally on paper" (p. 127).

Socioeconomic projects to "civilize" highland communities along the Thai border rapidly intensified during the Cold War (Hyun 2014; Keyes 2008). The international conflict played out in larger Southeast Asia as other nations (Myanmar, Laos, Vietnam) were gaining independence around Thailand (Keyes 1997). Large-scale state educational initiatives for highland communities thus began when Thailand's porous borders were of heightened state interest and highland communities were in the government spotlight (Vaddhanaphuti 2005). During this period, Indigenous highland people began to be stereotyped as dangerous and problematic to the security of the Thai state. National media and textbooks showed Indigenous communities as communist sympathizers and forest destroyers (Hongladarom 1999; Vandergeest 2003); there was a "hill tribe problem" along the borders of Thailand that needed to be dealt with (Keyes 1997; Laungaramsri 2003). The creation of this "other within" served to justify the political and social control of the borders and people into the twentieth century (Thongchai 1994; Hyun 2014). Schooling was thus a tool to ensure central state legitimacy, cultural assimilation, and ideological control of people and the ground the central state had claimed through the process of mapping (Vaddanaphuti 1991, 2005).

Mapping, Borders, and Indigenous Identity as a Threat to Nation Building

According to Thongchai (1994), before European colonialism, the Kingdom of Siam, Burma, and Vietnam were all overlords of the region, with overlapping kingdom limits. The Siamese kingdom was centered around Bangkok (See Fig. 1 above for a map). Smaller kingdoms (e.g., Lanna, Luang Phrabang, and Vientiane) and tinier chiefdoms (Karen, Lao, Phuan, Phuthai, and other ethnic groups) were interspersed along most of Siam's frontiers. These smaller kingdoms paid submission to multiple overlords for protection, where the chiefdom's limits of control also overlapped with others. Chiefdoms were more fragmented but had autonomy in the ruling of their community. As the British and French began establishing their

colonies around Siam, the Siamese were forced to modernize in order to maintain its sovereignty and prevent further losses of territory through the European technology of mapping. By the end of European expansion in 1909, the Siamese geo-body included various kingdoms that were culturally distinct from those living in Bangkok (about 30–35% of people of the Siamese empire) and that also recently had belonged to other political entities (Keyes 1997).

Mapping led to a territorialization of state power; it defined and organized people and place (Vaddhanaphuti 2005). First, the creation of fixed national boundaries prompted the establishment of state departments such as the Royal Forestry Department and the Ministry of Education. These institutions responsible for natural and human resources such as “unoccupied” forests and “unschooled” communities led to a “paradigm shift in the relationship between the Thai state and resources, people, and space insofar as the state had for the first time accepted responsibility to use all resources for the purposes of national development” (Vaddhanaphuti 2005, p. 153). In *Seeing Like A State* (Scott 1998), “contemporary development schemes. . . require the creation of state spaces where the government can reconfigure the society and economy of those who are to be ‘developed’” (p. 187). Thus there was a need to “transform peripheral nonstate spaces into state spaces,” which was often traumatic and racialized for the inhabitants of highland forest communities (Scott 1998, p. 187, also cited in Vaddhanaphuti 2005).

Second, boundaries constructed ethnospatial taxonomies of the “Other Within” as opposed to the We-Self of “Thainess” (Thongchai 1994, 2000a). Since the border of “Thainess” was more limited than the geo-body of the nation state, the Siamese elite embarked on a project to define the “Others within” that “reaffirmed their superiority, hence justifying their rule, over the rest of the country within the emerging territorial state” (Thongchai 2000a, p. 41). To be civilized, was to thus be “Thai,” and to be modern was to be the West (See Fig. 3 below). This taxonomy of “civility” was a product of both nationalism and globalization and drove Siamese elite to embark on projects along this ethno-spatial-temporal trajectory.

Compulsory state education was a tool to assimilate all ethnic groups under the blanket of “Thai-ness” or *ความเป็นไทย* (*kwarm pen tai*) (Keyes 1991). “Thai-ness” is a collective identity that also reflects the importance of ethnic homogenization as fundamental to nation-building and modernization, where conversely, heterogeneity is a threat to national security and nationhood (Laungaramsri 2003). “Thai-ness” was defined as three things: (1) *chat* or nation (where speaking Tai is a symbol of

Fig. 3 Table adapted from Thongchai (2000a), The others within: travel and ethnospatial differentiation of Siamese subjects 1885–1910

membership), (2) *satsana* or religion (being Thai is also to be Buddhist), and (3) *phra mahakrasat* or the King (which implied loyalty to the monarchy) (Keyes 1997; Laungaramsri 2003), and schooling was a way to make Thai citizens.

Under King Vajiravudh (King Rama VI), the Compulsory Education Act was created in 1921 to provide “equal” education for all. This act allowed the central government to dominate and control education in Thailand instead of letting ethnic minority groups like the Muslim and Chinese communities run their own schools. Central Thai became the language of instruction; until 2010, teaching languages other than Thai was forbidden in schools (Coalition on Racial Discrimination Watch 2012). In 2010 former Prime Minister Aphisit Vejajiva approved the National Language Policy to allow the teaching of other mother tongue languages and bilingual education in schools for non-Thai speaking children (Coalition on Racial Discrimination Watch, 2012). However, till this day, native languages are still prohibited at all times in highland schools run by the Border Patrol Police to continue to inculcate the idea of “Thai-ness” and loyalty (Hyun 2014). Curriculum and textbooks were also standardized to teach central Thai history, and teacher education programs mandated that all teachers are to be trained by government teachers’ college before they can teach in any school, including religious and private schools (Fig. 4).

Increasing centralized control at the height of Thai nationalism under King Vajiravudh fed emerging ethnic conflict in Thailand, strengthening regional identities (Keyes 1997). The 1930s and 1940s saw the rise of ethnoregionalism in north and especially in the northeast region of Isan (Keyes 1997). Central Thai leaders deemed ethnoregionalism a variation of “Tai-ness” based on geography and language. For these regional groups, Thai leaders began an “inclusivist” national integration policy to “accommodate diversity within a national community” (Keyes 2008, p. 14).

Herein lies the important distinction between “ethnoregional” identities and “ethnic minorities” classification, where “ethnoregional” groups refer to those within the nation’s borders are differences “taken to be characteristic of a particular part of the country rather of a distinctive people” (Keyes 1997, p. 213). Highland communities are seen to never be “Thai enough” and thus a problematic people (Morton and Baird *in press*). The “ชาวเขา (*chao khao*)” term highlights and accentuates a hill-valley dichotomy at odds with the *chao rao*, the us-people (Laungaramsri 2003). Highland dwellers, who once had an interdependent relationship with lowland dwellers, were now seen as dangerous and non-Thai. They were stigmatized, labelled as intruders to Thai territory, destroyers of the forests, opium cultivators, and a threat to national security (Laungaramsri 2003; Keyes 2008; Thongchai 2000a).

Thailand prides itself on never being formally colonized, but Siam’s escape from Western colonialism was legitimized and maintained ironically by their quest for modernity based on drawing knowledge and skills from the West, so much so that scholars have labelled Thailand as having undergone a process internal colonialism or “autocolonizing quest for *siwilai* (civilization)” (Thongchai 2000b; Loos 2006; Harrison and Jackson 2010, p. 18). As a response to growing pressures from EuroAmerican imperial forces during the colonial and postcolonial periods, the Siamese elite’s internal colonization as they built the nation-state makes Thailand

Fig. 4 Photo of highland ethnic students lining up in front of their school and listening to their teacher after singing the Thai national anthem, chanting in Buddhism, and paying respects to Thai national flag (Cover of textbook on Thai Peoples), highland village of Northern Thailand, in early 1980s (Non-formal Education Center, Lampang, 1985)

“semicolonial” or “cryptocolonial” (Harrison and Jackson 2010). Education was thus an important tool for the consolidation of state power driven by EuroAmerican frames of modernity. For with it, political and national purposes could be realized.

Education for Indigenous Highland Communities as Complex and Contradictory

It is difficult to identify a single comprehensive policy for the education for Indigenous communities in Thailand. Often, there were many organizations with overlapping or even conflicting agendas (McNabb 1993). The first state government schools in the highland community were in 1935 in Tak Province. Then in the 1950s, Border Patrol Police schools and Chao Pho Luang Uppatham (His Majesty the King’s Patronage) schools were set up in Chiang Mai and Chiang Rai Provinces. Later on, schools under regular and specific educational agencies were built in highland villages.

Today, there are a few key players providing education to highland communities. First, the Office of Basic Education Commission is responsible for all schools. This

office sets up school branches in highland villages. Second, the Non-Formal Education Office is in charge of setting up learning centers and bilingual programs in villages where schools could not be set up. A third player is the Special Education Administrative Office, and its two branches, the Welfare Education Schools and the Royal-People Welfare School, build schools in mainly remote areas for children “at-risk.” Fourth, the Border Patrol Police Command Office is also a key player in highland Indigenous education and has set up schools-cum-surveillance centers supported by Thai Royal projects. Finally, the National Buddhism Office also educates ordained highland boys and provides vocational education to girls (Buadaeng and Leepreecha 2009).

These governmental programs ranged from defense concerns to deal with the “hill tribe” problem, tourist development, opium crop replacement initiatives, nation-state objectives, and even unresolved issues such as land ownership and citizenship debates. Educational policies also tend to stretch a monocultural-multicultural continuum, with debates surrounding what “level of cultural diversity is appropriate in the curriculum, the amount of resources that can be allocated to minority schools, and the extent to which higher educational achievement should be encouraged” (McNabb 1993, p. 18). Mobility for Indigenous youth is thus often “one piece of a larger, more complex set of relations, strategies, and negotiation” (McNabb 1993, p. 25).

Indigenous education policies are not only complex but also often contradictory and based on a kind of “selective integration” (Vaddhanaphuti 2005). On the one hand, Indigenous communities are seen to live in harmony with nature and are often used as a symbol of Thailand’s diversity. Indigenous art and culture is often appropriated for tourism and marketed as part of Thailand’s exotic attractions. At the same time, Indigenous communities are seen as uncivilized protestors that oppose the government’s forest policies, fighting for the right to solve their own challenges (Vaddhanaphuti 2005).

Cold War Pressures: Assimilative Education Policies

For the state, schools are important “technologies of power” that are part of ongoing efforts to create, modernize, and secure the Thai nation (Foucault 1977 as cited in Keyes 2008, Jukping 2008; Kampe 1997). Schools were designed to instill a “development orientation” in villagers so that they will “come to accept the domination of the Thai state as an unquestioned given in their social life” (Keyes 1991, p. 89). For the “hill tribes” in northern Thailand, it is clearly stated

Education for tribal people should be implemented in a distinctive way, which differs from general lowland primary schools. Specific educational curriculum should be developed. Teachers [who will be sent to teach tribal children] should be trained in an extraordinary course. It is not only for tribal people to be able to read and write, but also to have them loyal to the government.” (Kachadpai 2518 [1975], p. 226, translated by Prasit Leepreecha)

The first large-scale state educational initiative for Indigenous children began with the creation of Border Patrol Police schools-cum-surveillance centers in

highland villages (Hyun 2014). This included the training and deployment of Border Patrol Police to teach central Thai language and history to highland communities. During the Cold War era (1956–early 1980), 721 Border Patrol Police schools were set up to build a “human border” along the territorial border” (Hyun 2014, p. 344) so that the border of “Thainess” would coincide with the defined geo-body boundary of Thailand (Hyun 2014). There are currently about 61 Border Patrol Police schools in northern Thailand with about 507 teachers and 30% being heritage teachers – teachers who had previously attended Border Patrol Police schools and came back to teach (Hyun 2014). National security was equated to strong Thai nationalism and the Border Patrol Police schools administered government presence and ideological control to fashion Thai citizens (Gillooly 2004). Second, government programs and Christian missionaries also brought Indigenous youth to city centers to study (Keyes 1997; McNabb 1993). Buddhist missionaries then followed suit to begin similar assimilation projects (Keyes 1997). This practice is especially common for students who want to continue onto secondary school in villages without one.

In school, the teaching of nation-state traditions, symbols, and songs, along with the use of official calendars, state-sanctioned textbooks, and learning materials based in the Thai language and history “re-shaped local worlds” (Keyes 1991) and also created imaginary ones. Through school, disperse populations would thus feel like part of an “imagined community” based on Thainess (Anderson 1983/2006). Schools enacted a “spatial culture” with a temporal order where uncultured, rural citizens learn how to appropriately interact with government officials and organizations (Keyes 1991, p. 90). Teachers are “cultural brokers” (Keyes 1991) that “ha [ve] leaned less toward brokering knowledge relevant to the villagers’ world than to establishing the authority of a particular form of knowledge” (Keyes 1991, p. 109) – in this case, the superiority of Thai knowledge and the Thai way of being.

Moreover, textbooks and curriculum produced and distributed in Bangkok seldom mention ethnic minorities, unless in ways that characterize highland Indigenous people as problematic. Schools perpetuate ethnic stereotypes through such deeply troubling practices while Indigenous history, knowledge, or traditions of highland communities are not represented in state-disseminated educational materials. Such projects to “civilize the margins” that were based on “ethnocide” and “cultural imperialism” (Duncan 2004, p. 108). In fact, these assimilation and erasure projects were deemed so effective that the Tribal Research Institute focused closed in 2004 stating that “there was no need for the further study of the hill tribes as they were now considered to have become Thai” (The Nation April 15, 2004; Buadaeng 2006).

Global Pressures: Testing and Other Global Trends in Education

Moreover, in standardized testing, Thailand’s Ordinary National Educational Test or (O-Net) reveals the “myth of meritocracy” by using testing as an evaluation tool (Goodman 2013). Goodman (2013) argues O-Net promotes a kind of “policing” and a “normalizing gaze” of the Thai education system (citing Foucault 1977). This normalizing gaze “molds society in nearly invisible ways and encourages

self-censorship” so that students are “methodically socialized” to accept the true knowledge of the test and not question the central knowledge of the O-Net exam. For example, a multiple choice question (See below) asks “The kind of terrain in which humans chose to settle from ancient times until today is: (a) river basins, (b) plateaux, (c) mountains, or (d) valleys” (Goodman 2013, p. 11).

Question on the O-Net Thai National Test (Goodman 2013, p. 11)

The kind of terrain in which humans chose to settle from ancient times until today is:

1. River basins
2. Plateaux
3. Mountains
4. Valleys

The question privileges lowland communities over highland ones as they are the “humans” that chose to settle in river basins (only one answer is allowed) – as real humans live in the river basin, not the mountains. Similar questions privilege urban knowledge over rural knowledge and the use of central Thai as the official language. As this test that can deny or admit students to university, O-Net seems to privilege only knowledge from the center and is another tool to consolidate central power for nationalistic purposes. Goodman’s (2013) analysis of the Thai standardized test shows the educational hegemony that has begun to shape education initiatives and to determine the lived opportunities for students in Thailand. Thus the longer Indigenous students participate in the dominant national state schools, the more often they accept Thai hegemony and their second-class status in Thailand.

Nondominant communities that do not align with these goals, nor perform according to this one measure are then deemed deficient and are seen in need of remediation. An added layer of pressures includes global education reform movements that promote only one “ideal” way of being – one congruent with human capital theory that supports consumption, individualistic competition, and economic production (Tatto 2006; Tabulawa 2003; Meyer and Benavot 2013). In the 1990s, with increasing globalization, Thai education systems were worried about building a “knowledge economy” (Baron-Gutty and Chupradit 2009). For example, “global languages” like English and Chinese are offered in every school and are valued more highly than local languages. The interconnectedness of the globe and by extension, education systems, has had an unprecedented effect on teachers and their work and lives (Paine and Zeichner 2012).

Long-Term Impacts of State-Led Educational Initiatives for Indigenous People

In a study of Indigenous students studying at university or vocational schools, McNabb (1993) still questions the effects of educational “achievement” on Indigenous families and communities – mobility at what costs? While the Thai government is mainly designed to socialize Indigenous youth as inferior to their Thai

counterparts, the government, along with NGOs and missionary groups, has provided financial resources to support Indigenous youth to pursue higher education (McNabb 1993). Even so, the “development” of “hill tribe” communities has often come at the expense of “environmental degradation, loss of cultural identity, and the enhancement of conflict between the hill tribes [sic] on the one hand and the state agencies and lowland farmers on the other” (Vaddhanaphuti 2005, p. 164).

Still today, Indigenous youth in urban areas are constantly framed as being deficient in contrast to norms of Thai-ness. Similar to how the label “English-language learners” often reinforces “deficit-oriented, uncomplicated, and uneven narratives about students” from non-dominant communities (Gutiérrez and Orellana 2006, p. 503), Indigenous youth are “Thai-language learners” that need to be “made Thai” in order survive function in Thai society (Kampe 1997). Furthermore, such a label essentializes such a group trait and with it, comes assumptions about academic deficits or disadvantages (Moll 2000; Nasir et al. 2006; Rogoff 2003). Often in Indigenous education, instead of seeing multiple cultural practices within the school as an asset to the construction of a rich learning environment, heterogeneity or “otherness” is often seen as a deviation from the established dominant norm.

Furthermore, due to the lack of representation of highland communities in state-disseminated curricula, Indigenous youth often regard local languages, traditions, ways of knowing, and even the elders themselves to be “backward” or “old-fashioned” (Chandraprasert 1997). They often aspire to be like the *khon muang*, the “city people” (Wallace and Athamesara 2004). This is particularly true for urban Indigenous populations that frequently interact with Thais. They aspire to speak Thai without an accent and may try to hide their tribal identity when operating in lowland Thai society. Thai identities are assumed over tribal ones, and ethnic inferiority and erasure are systematically organized in younger generations (McCaskill 1997; Chandraprasert 1997; Chotichaipiboon 1997; Hyun 2014).

While some highland youth can speak Thai fluently, they often experience conflict between their cultural identity and their Thai national identity. For example, in the Border Patrol Police schools that currently exist in the highlands, there has been a *heritage teachers* program to encourage those from the various Indigenous groups to return to their villages and teach. These heritage teachers who return to the village were proud to assist in their village’s development but simultaneously also felt that they were outsiders to their own village. They did not feel respected by the villagers because as Thai government officials, they were perceived to have “become fully Thai” (Hyun 2014, p. 349). At the same time, these teachers are often never “Thai enough” when participating in Thai society. They *both* want to send their children to Thai schools for a chance at a “better life” and even move into the dominant spaces to acquire membership in that group (Toyota 2005, as cited in Hyun 2014) and also want to be able to teach their own language and traditions to their children.

While the state has set up an Indigenous and Thai identity to be in conflict with each other, we now turn to how Indigenous youth and communities have in fact dextrally navigated through seemingly opposing home-school worlds to build coherent identities for themselves and their communities. In the next section, we

outline moves to resurgence as youth and communities participate in the protection and expansion of Indigenous identity in Thailand today.

PART III Building Coherent Communities – Movements Toward Expanding Indigenous Identity Through Education

Indigenous people of the Greater Mekong Subregion have always “challenged the limits” of such control and asserted their identity and culture (Leepreecha et al. 2008a). This movement has become even stronger since 2007 with the creation of community and youth networks of Indigenous activists to ensure the well-being and educational justice of local communities in Thailand. Moreover, there have also been more transnational efforts that purposely work to refuse national boundaries as limits to collaboration. In this third section, we explore why education is a community right for Indigenous communities. We do so by outlining three moves to Indigenous resurgence. First, we provide a case study of how families in highland villages are collaborating to design local curriculum and implement Mother Tongue education in their schools. Second, we highlight an urban Indigenous school and how they have designed pathways home by deeply engaging students in a learning network that builds from family knowledge. Last, we explore other ways that Indigenous communities are reinventing what it means to be Indigenous within and beyond Thailand today. They are expanding ideas of literacy and development and creatively leveraging globalization and technology to strengthen Indigenous identity in their own communities locally and across borders (McCaskill et al. 2008).

Education as a Community Right

In 2005, the Thai government passed the Education for All Cabinet Resolution that mandated public education be expanded to all children regardless of nationality and legal status up to Grade 12. However, despite state efforts and pressures to broaden access to education, a central question here is education by whom and for whom?

One guiding basis of movements in Indigenous education in Thailand today is that families and communities have the right to play a part in the education of their children. While rights frameworks often still follow nationalist agendas and EuroAmerican frameworks, it also affords a certain kind of consciousness about ones’ rights to culture and education (Barry 2013). In the 1990s, grassroots organizations, like Prawase Wasi and the Assembly of the Poor, criticized the centralized military-based administration, particularly the Ministry of Education, calling for more power to be given to local communities in order to mitigate corruption (Baron-Gutty and Chupradit 2009). During the revision of the constitution of 2540 (1997), villagers throughout the country contributed their thoughts and perspectives to what would be called, the “Constitution of the People” (Baron-Gutty and Chupradit 2009). Community rights in this new constitution included rights to natural resources management, rights to protect their own culture and local wisdom,

and rights to education – that is, the right to teach about their own knowledge for their children in the regular state-sponsored school system (Barry 2013).

In line with the 2540 (1997) Constitution, the National Education Act (NEA) of 2542 (1999) was passed as the largest education reform to promote the decentralization of national curriculum. This act mandated that 30% of all school content should be provided and developed by the local community, driven by local participation in the education of their children, while the remaining 70% of courses taught in K-12 education would come from the national curriculum (NEA 1999 Section 23; Minister of Education 2003 as cited in Baron-Gutty and Chupradit 2009). Legally, each community has not only right to, but obliged to decide what knowledge and practices their children should learn at school.

This 30–70 composition of the local-national curriculum is not actualized in most urban and rural schools. Teachers and school administrations continue to teach without collaborative community participation. They do not invite local community leaders to design and teach local wisdom or languages. Indigenous networks and NGOs have tried to mediate the school-community relationship by working with school leaders and teachers first, to open up space their curriculum for local knowledge systems, and second, train the local experts in the development their own courses that can be taught in local schools.

Indigenous communities have become increasingly aware of the need to build coherent narratives and make meaning of seemingly separate modern knowledge and local wisdom systems (Fujioka 2002). One important example of this is school-village collaboration in Mother Tongue education, particularly for preschool and elementary students. The most successful cases are when local elders and teachers collaborate to create mother tongue and local curriculum that are cotaught during the school day. Furthermore, due to increasing numbers of students leaving their home villages to study in the cities, there also have been initiatives to work with welfare schools in the cities with high populations of Indigenous youth. To illustrate how Indigenous resurgence has begun in across rural and urban schools, we provide two case studies of Indigenous education movements in the following sections. These two examples offer varied ways of how families and communities are centering their dreams and claiming their right to shape the educational experiences of their children (Fig. 5).

Moves to Resurgence I: Collaborations for Mother Tongue Education in Highland Communities

Thai language is intimately linked to Thai nationalism and nation building. The teaching and use of Indigenous languages in public schools is still deemed suspect and contrary to national interests. We provide a case study from the Inter-Mountain Peoples Education and Culture in Thailand Association (IMPECT) and their longstanding work in protecting Indigenous mother tongue languages. This case is important because of the nature of collaboration between various actors – elders, families, and local Thai school teachers – to create locally designed curriculum and

Fig. 5 Indigenous students demonstrate their ability on reading and telling story in both indigenous and Thai languages at the annual mother-tongue conference in Chiang Mai Province of Northern Thailand (Taken by Prasit Leepreecha in 2015)

mother tongue language instruction. We discuss their work in a primary school in the Mowakhi village in Chiang Mai to show that when community participation is truly valued and sustained, education with community members actually helps to build a bridge to students' sociocultural heritage, while also advancing local and modern knowledge (IMPECT 2012).

The multigenerational Mowakhi school involves local leaders, parents, and teachers intimately in the village to design materials and course content for their children (IMPECT 2012). The school curriculum emphasizes learning both Thai and the Pgazk' Nyau systems of knowledge as essential to prepare their children for civic and economic participation both in Thai society and village life. For over 20 years, this school has been kept alive by its community, just as it, too, advances local ways of knowing and being. This has even sparked a growing movement in neighboring villages to also celebrate and uphold their people, language, and ways of knowing. This is similar to Wallace and Athamesara's (2004) work that provides a case study of a community-centered curriculum that involved and honored local community member's histories and knowledge in a rural highland community.

Through this school, the Pgazk' Nyau have prepared their children and their community to expand their identity through a connection to community stories and practices, and in so doing, strengthen their agency for active civic participation in Pgazk' Nyau community life and larger Thai society (IMPECT 2012). In the Mowakhi community, community members are deeply involved as teachers, curriculum designers, and key decision-makers at school. It is only with this heterogeneous expertise based in multiple epistemologies and practices that communities move closer to self-determination in Thailand (IMPECT 2012; Wallace and Athamesara 2004).

This kind of village-school collaboration is difficult to sustain at times. For example, the Hmong village of Mae Sa Mai in Chiang Mai highlights some of the challenges in implementing locally designed curriculum. Even though there were a variety of program offerings that ranged from local plant medicines, working with silverware and tree

plantation and reforestation, cooperation between teachers and elders was unclear (Buadaeng and Leepreecha 2009). Furthermore, teachers' definition of local knowledge often narrowly focuses on vocational skills training and the sale of products, not so much for the learning of school-based subjects (Baron-Gutty and Chupradit 2009). Indigenous home practices and knowledge systems are still largely ignored and not considered productive nor important for school. In other instances, local teachers might be reluctant to collaborate with villagers or are too focused on completing the national syllabus, viewing integrating local knowledge systems as less important. Integration of curriculum might require fellow native educators and NGOs allies to negotiate strategies to make local curriculum an enacted everyday practice in the formal school systems in the villages (Buadaeng and Leepreecha 2009). Since developing local curriculum is not funded by the state, lack of funding for communities to design and teach this curriculum to the youth make might such a project fall through.

However, knowing that cases like the Mowakhi school are possible, more communities are exercising their agency to embark on similar collaboration efforts projects that leverage the National Education Act of 2542 to teach their Indigenous languages and knowledge systems. In 2007, various schools came together to share their locally developed curriculum "Education Systems and the Preservation of Local Wisdom and Ethnic Culture" research program at Chiang Mai University (Buadaeng 2008b). Elders and teachers continue to work through such challenges so that imagining education for self-determination does not have to be a distant reality. In the next section, we highlight another way to create connections between home and school knowledge, and how this might be possible for more communities.

Moves to Resurgence II: Designing Pathways Home from Urban Indigenous Schools

Told that the city offers "better" educational opportunities for their children and that advancement means children must leave behind their community and family in the mountain and adopt urban nation-state forms of life, there is an increasing trend of parents sending their children to stay and study in boarding schools in the city (Morton and Baird *in press*; Buadaeng and Leepreecha 2009). Furthermore, some village schools only go up to Grade 6 and attending secondary school means that students must leave their home villages to study in the lowland cities. This is also driven by financial incentives from a variety of donors and missionaries to provide free room and board for Indigenous highland students while they study (Buadaeng 2008a). While this may create layers of complications between the goals of the donors and state schooling, continuing education after the elementary grades in schools in the city have opened pathways to higher education, but students who have migrated to lowland areas also often lose connection to their homelands and feel inferior to their Thai counterparts (McNabb 1993).

Recently, the largest urban government-supported welfare school in Chiang Rai has undertaken strategies to create connections between school and home. Founded by two Karen educators, Sahasatsuksa school has a student population of over 2700

students from 12–15 different tribes. Almost all their students live in hostel facilities run by Christian or Buddhist missionaries or other international aid groups. While most of the teachers are not Indigenous, there are a significant number of Indigenous teachers who have graduated from Sahasat, then returned to teach there. Sahasat teachers already visit the villages of their students each year to meet with families and here we present initiatives from this urban Indigenous school to describe a new effort to design pathways home for the increasing number of students coming to live and study in the city.

In February 2015, Sahasat began designing learning in tutorial relationships (Tutoría), where students learn to engage in dialogue with their teachers and with each other as a way to learn. Originating from México, Tutoría attempts to transform alienating vertical relationships of power between teachers and students to build a horizontal learning network where students are part of the teaching community in class (Cámara 2003). This was a way to deeply engage heterogeneity in the classroom as this learning network called for student and family participation in a teaching and learning network and more youth and family designed curriculum (Meixi 2017). The data in this paper comes from a community-based design research study that initially involved school leadership, teachers, and students in 2015, and then expanded to include families in 2017 (Bang et al. 2010). In the following section, we highlight some reflections from students, teachers, and families from this work to design pathways home from school.

The first shift that we saw in Sahasat was that students felt that they had value and could contribute to the work of teaching and learning at school. This also resulted in changes in the way students also advocated for new forms of teaching and learning. Using a collection of 40 student reflections, we highlighted typical student responses after they have participated in the Tutoría learning network.

Student 1: I have fun. I can learn in an easy going way and I can have my own thinking because it's easy going activity and I have fun. I dare to think and take action.

Student 2: I am glad that I have learned new things and I have become brave because I have brought what I have known to teach my friends. Normally, I am not a brave one. After I have taught others, I have become brave.

The idea of “dare” was coded on 15 student responses. These students use the Thai word “กล้า,” meaning “to have courage” or “overcome fear to do something.” Importantly, it was the relational nature of learning that made it “fun” and “easy going” so that students felt the responsibility and desire to contribute to the learning network. One other student wrote, “Everyone can help teaching, every classroom should be equal.” This student recognized an individual’s own abilities to be a part of teaching, but also saw that the classroom was full of other actors too.

Classroom is often governed by fear and students in small ways are finding their voice and gaining confidence that their opinion matters, that they could own and be agents of learning at school. Students understood their new role as assets to the class and now considered themselves mediators and designers of learning where normatively, teachers are seen as the main mediators of learning in the classroom.

Furthermore, as more students “dared” to be brave and take up agency in learning, teachers also began to question their own perceptions about students’ ability to participate in the work of teaching and learning at school. In a collective reflection session a teacher, Teacher O recognized she was engaging in the suppression of the use of the Akha language in her students in contrast to Thai, which is constantly insisted on as the language of use in school. Akha is an Indigenous language, spoken by around 1000 Akha students in Sahasat school and is one of the commonly spoken languages at school. She said, “I told them, you can’t use Akha to explain it to each other because tomorrow morning, students from (another school) are coming and you can’t use Akha with them! But actually now that I think about it, they actually should speak any language, like Akha.”

Indigenous youth are often asked to not use their language in order to integrate and interact with their Thai counterparts. Speaking Thai is to orient oneself outward, for communicability and translation. While this is true, native languages are often subordinated to the use of Thai. Teacher O makes public her shift from a curriculum-centered framing to a child-centered frame; she began to orient in, toward the child, not what the curriculum externally demanded of her. This is a powerful move of resistance to the required subordination and it is also a standing up to common notions of what is valued by the state. Ultimately it worked against the devaluation of Indigenous peoples and their ways of knowing, speaking, and being.

Furthermore, during our family interviews at students’ home villages, families shared skills and practices that were important to their family and community. While there was a shyness about the knowledge that the family held, there was also pride in intergenerational knowledge of bamboo for the creation of their home and in the expertise in recognizing patterns when harvesting mangoes. In one family, a student, Beu heard about the practice of his grandmother who was an expert at spinning cotton into thread but also that his mother could not do so anymore. When asked what learning he wanted to design at school, Beu spoke of his desire to learn the practice of cotton spinning and prevent its potential loss of such a valuable family practice. When asked why he wanted to focus his curriculum on this practice, Beu said, “I want to create lessons on practices that we had before but are not really seen in everyday life today. . . what people did in the past, like how we can turn cotton into thread.” Beu is currently working with his grandmother to create and teach this practice to his teachers and classmates at Sahasat. Indigenous youth in urban areas can be conduits that actively build school-village connections for continued family involvement in the practices of school.

These are some examples of how urban Indigenous youth and their school are opening up spaces to design pathways back home to strengthen relations between knowledge systems that schools and society has otherwise have tried to erase. This, however, just involved 6 students out of the 2700 at Sahasat and more work needs to be done to open up these spaces at school. Designing participation structures and curriculum at school was a potential pathway to a resurgence of these community practices and as Beu shared, for such practices to take on contemporary forms.

Instead of allowing the state to run and determine educational pathways for their children, Indigenous peoples have solidified and expanded their role to set goals,

negotiate curriculum, and participate in school, both in highland villages and in the lowland areas where they send their children to school. In light of the history of state education as a means to remediate deficits, designing for legitimate student and family participation in the work of learning and teaching at school opens up new possibilities for strengthening both school and home practices by creating coherence between them.

Moves to Resurgence III: Expanding New Terms and Identities to Build Indigenous Power

Until today, Indigenous peoples have developed a variety of strategies to defend their rights to define “development,” define “language,” and to define who they are. Particularly when their world is highly globalized and international borders are increasingly porous, “nation-states continue to exercise substantial control over Indigenous people and their territories” (Leepreecha et al. 2008b, p. 2). However as schooling attempted to forget who we are to reshape local worlds, Indigenous communities have always been shaping their own worlds and reconstituting space and possibility. Indigenous communities are always in processes of “internalizing aspects of globalization and nationalism, while at the same time attempting to externalize aspects of their Indigenous cultural beliefs and practices” (Leepreecha et al. 2008b, p. 2). In the book *Challenging the Limits* (2008a), Leepreecha et al. synthesize five strategic response of various Indigenous groups in the Greater Mekong Subregion to the forces of globalization and nationalism. The first tactic is direct mobilization and organization in the case of the Karen in Burma. Second, groups have been taking control to defining their own identities as a way to counter dominant negative stereotypes and gain recognition and influence in the social, economic, and political spheres. Third, Indigenous groups have been reconstructing social relations and traditional knowledge in order to maximize influence and benefits from existing government structures. Fourth, other groups have taken a more subversive stance involving nonconfrontation but the “rejection/withdrawal/escape/hiding” in response to expanding power and control by government and nongovernment authorities (Leepreecha et al. 2008b, p. 7). Last, others have challenged the notion of boundaries to form cross-border projects through “the use of available social and cultural spaces” to take advantage of the opening of more economic and diplomatic relations between states. These movements take place in a context of collaboration and learning and building upon the tactics and strategies of each other.

For example, Hmong communities have collaborated to create a transnational identity with the aid of technology (Leepreecha 2008). Nationalism and globalization which were meant to shape and erode Hmong ethnic identity can and has been reappropriated. In a study of Hmong identity, Leepreecha examines how Hmong communities in Thailand and the USA transcend state borders to create artifacts of globalization for a shrinking world. These include audiovisual media, publications, and cultural artifacts such as story cloths for circulation. Hmong communities have also expanded global networks of kinship to cyberspace, churches, and businesses

for increased connections across time-space to strengthen and reproduce Hmong identity (Leepreecha 2008).

Similarly, Lahu communities work between a tension of opposing forces of homogenization, erasing difference among various practices that exist in an imaginary space, and heterogenization, maintaining and creating difference at local levels (Pine 2008, citing Appadurai). Using the case of literacy, Pine (2008) examines how the Lahu have been “desettling” ideas of literacy through being aliterate. While writing is a technology of power, “the possession of writing identifies the group in question as modern, while the absence of writing is an important aspect of a “traditional” identity,” as in the case of the Lahu (Pine 2008, p. 220). While the highland-lowland divide has categorized hill tribe peoples as being uncivilized and less developed because they possess no writing system, Pine offers that the Lahu challenges common notions of literacy that supposedly is at the pinnacle of a “civilized” culture and the classification of “developed” people based on orthography. Instead, being Lahu is a practice and *speaking* Lahu is at the heart of it. Lahu “loss-of-writing myths” problematizes literacy as a homogenous discourse today and the ways which we understand development and civilizing projects (Pine 2008). In a world where being with-writing grants access to the “civilized” and “global currents intent on eliminating difference” (p. 232), Lahu people are negotiating what it would be to be with-writing, just as those with-writing cannot place Lahu and other minoritized groups at the margins of literacy practices.

Finally, while the Karen were more readily accepted into Thai society, they too undergo the “dual process of defining one’s own group and being defined by others to establish meaningful ethnic group boundaries” (Leepreecha et al. 2008b, p. 2). Their strategy has been a “process of converting modernity into tradition and inscribing part of their knowledge tradition into modernity” (Gravers 2008, p. 150). They have participated in official governmental capacities across borders, while mobilizing their own communities, protecting their Indigenous knowledge systems and cosmology, and using “communalization within/against nationalization and globalization” (Gravers 2008, p. 174).

Compulsory state schooling steeped in Thai nationalism and global orientations to education mandate that Indigenous youth constantly negotiate being essentialized in their individual and collective processes of becoming. In this section, we have tried to show various ways the expansion of connections between school and home can help Indigenous youth navigate and move between the worlds of home and school to find coherence in the making of who they are. In response to efforts to define, reduce, and simplify, Indigenous identity in Thailand, youth and families hold the complexity of what it means to be Indigenous today. They hold onto their histories, languages, practices, and culture while simultaneously invent and expand the definitions of what it means to be Indigenous. They have creatively used globalization to strengthen their own movements and identities (Leepreecha *in press*; Leepreecha 2008). They have used the school to facilitate increased connections to their language, practices, and culture, *and* learned the skills and tools to allow them to navigate Thai society with incredible dexterity. The move to see themselves as “both” “and” are Indigenous moves to resurgence.

Conclusion Building a Fire: Bridges of Power Toward a “Both–And”

ສິ່ງ ມ້າ າ່-ມີ ຫໍ, ຫໍ ມ້າ ີ່-ຮ້າ ັ.

When there is lots of wood the fire is strong; when there are many people their strength is great.

– Lahu Proverb

(Using transcription by Matisoff 2011)

In the years ahead, the Network of Indigenous Peoples in Thailand continues to build a stronger network to negotiate pathways to Indigenous education with the state government so that parents and community leaders can determine the learning of their young. We are collectively creating bridges of power that both ground our young people in their own language and culture and provide them the skills to participate in Thai society. Unlike Indigenous movements in the Americas, Indigenous people in Thailand often have to prove they are “Thai enough” to have their claims translate into actual provisions and rights (Morton and Baird *in press*). Like in the Lahu proverb above, this makes a transIndigenous, transborder network is key to sustaining its development and strength to understand and grow from how others navigated the complexity of state policies and provisions.

For Thai educators and policy makers, they should understand that Indigenous identity is not in conflict with a national one; youth should not need to choose between being Thai or “not Thai enough.” Schools must support Indigenous youth to be proud of *both* their history and culture *and* also be “Thai-enough.” Indigenous youth and peoples always have and continue to build a complex yet coherent identity of what it means to operate and thrive in the space in-between school and home, from highland to lowland, from home wisdom to Thai ones. They do so with amazing resourcefulness and grace. Our schools need to allow for and accept the navigation of complex, multilayered identities that our Indigenous youth bring to school.

Finally, there is much more research to be done in the academy to highlight and the ongoing strength and struggles of Indigenous people in Thailand and in Asia. This will help people understand and resist the erasure of Indigenous communities in Asia and expand the conversation of settler-colonialism that is conflated with inter-race dynamics. The concept of indigeneity is beginning to be recognized in Asia and has been officially adopted by governments in Japan, Taiwan, Nepal, the Philippines, and Cambodia (Erni 2008). Many Asian governments, however, continue to reject the concept of “indigeneity” (Erni 2008). Increased research in this area will help shift and expand public opinion and policy on indigeneity in Asia where much more work and research need to be done to resist the continued erasure of Indigenous people in the region. Being Indigenous in Asia is deeply political and the more voices we have centering Indigenous voices on this complex issue, the stronger our fire.

Abstract

Increasingly, over the past decade, environmental problems have forced Indigenous farmers to rethink broader impacts to their self-reliance where exogenous environmental destruction represents another shift for Andean Indigenous

ontologies – demanding multiple and innovative interventions and strategies. This chapter argues that conceptions, practices, and spaces of Indigenous education based in Indigenous knowledge systems constitute the central arena from which to consider these problems. Thus, in order to advance notions and practices of Quechua education, this chapter first traces ideologies of conquest to projects of development and their social, cultural, economic, and political impacts in the highlands of Peru. This chapter then draws from archival and Quechua narratives in order to highlight Indigenous epistemologies, specifically Quechua knowledge systems that situate the Andean world as an ecology of balance and struggle. Lastly, international discourses of environmental rights and human rights education in Indigenous educational design and practice are discussed.

Introduction

At first, everything was empty and dark. The creator Con Ticsi Viracocha created the sky, the earth, and the first beings that would inhabit the earth.

The earth was populated with immense animals and people who lived in disorder and without harmony in the darkness. Because of this, they say that from the lake of Collasuyu swelled once again Con Ticsi Viracocha accompanied by other deities. Because the people he had created at first had acted poorly, he turned them to large stones. Suddenly, he made the Sun and the Day and commanded that the Sun walk the course that he takes. Then he formed the Stars and the Moon. From the same stones, he forged certain people: a leader to govern and rule and pregnant women and others with children. He said to his companions: “These people will be called such and will emerge from such spring, in such province; there they will populate and there they will grow; these others will emerge from such cave, they will be called this, and they will populate these provinces; and like this, according to these models, they will emerge from springs, rivers, caves, and other places that I say.” (Taken from Quechua oral tradition by Gutierrez Verastegui 1986, translated by the author)

Despite the expansion of European empires through vicious colonial strategies that left lasting imprints on Indigenous homelands across the globe, extant Indigenous epistemologies and cultural practices have been exceptionally resilient. From vibrant origin stories to local Indigenous scientific knowledge, many Indigenous communities worldwide maintain connections between peoples and with their environments, evident through daily practices and special ceremonial observances. Quechua peoples encompass thousands of Andean highland communities, and their stories, language (Quechua and its many local varieties), and agricultural ways of life exemplify this indelible spirit. Quechua children are taught through lectures and stories like the one translated by Gutierrez Verastegui (1986) that this life is a rich full life, *sumaqa kawsay*, to be lived honoring the beings that facilitate all life on earth, like *Tayta Inti* (Father Sun), *Mama Killa* (Grandmother Moon), and the *Apus* (deities). (In this chapter, I do not italicize Quechua words in order to make the

statement through the writing that these words are on par with English. This was taught to me by Maori colleagues Huia Jahnke-Tomlins and Margaret Forster in 2015 through a writing collaboration project.). Quechua community members are also taught values associated with life – that things in creation must be appreciated, taken care of, and most importantly, respected, admired, and loved (Bolin 2006; Ames 2013a; Sumida Huaman 2014). These values cultivated by a life in the chakra, the farm fields, of the Andes are exercised through respectful interaction and acknowledgment through prayers and regard for the life force that flows through everything, pacha. Such ancestral protocols are key elements of Indigenous knowledge systems and Indigenous ways of knowing, which embody the philosophies and values-based actions that define the relationships that Indigenous peoples hold to their worlds (local environment, living and nonliving beings), the universe (beyond the local environment, stars, planets, constellations), and to each other (human interactions within community and with other, even distant peoples) (Barnhardt and Kawagley 2005; Alfred and Cornassel 2005; Sumida Huaman 2014). Moreover, these Indigenous systems are innovative; that is, they are based in ancestral beliefs and practices, as well as considering other useful forms of knowledge, including Western knowledge.

At the same time, despite value to the sociocultural identity development of Quechua children and the ideals of harmonious balance of the Andean world, Quechua knowledge systems, if acknowledged at all, were negated starting in the sixteenth-century colonial period as demonstrated by Spanish accounts (Cieza de Leon 2011). Today, Quechua knowledges and associated cultural practices are actively demeaned in mainstream Peruvian discourse as either deterrents to national goals of modernization – especially when related to natural resource extraction on Indigenous lands – or as irrelevant and insignificant towards “real” or valid advancement in science, technology, and education in the name of national progress (Sumida Huaman and Valdiviezo 2012). Complicating the dominant construction of Quechua peoples and the valuation of their knowledges are specific and increasing environmental shifts and events, some beyond Quechua and local community control, which produce consequences for those living an already publicly disparaged rural or agricultural lifestyle (Ames 2013b). For example, in 2016, local media reports emerged from various regions around Peru linking extensive damage to agricultural harvests with environmental issues, including climate change. In some regions, over 90% of Indigenous crops were lost due to new forceful weather patterns, forcing regional governments to declare states of emergency and Indigenous farmers to rethink broader impacts to their self-reliance.

As the impacts of development and globalization are debated in Peru and more widely in Latin American, how Indigenous communities will envision and drive their own futures are critical questions, and central to this discussion is the role of education at all levels, which is perhaps the most important arena from which to consider Peru’s most persistent environmental, social, political, and economic strengths and weaknesses. Indigenous education (conceptions, practices, and spaces) based in Indigenous knowledge systems and efforts to explore the richness of Quechua knowledge systems and what yachayninchis (our knowledge) has to contribute to local and global solutions are at the heart of this chapter. At the same time, due to tenacious processes

of colonization in the Americas beginning in the late 1400s and subsequent projects of development that have created environmental, social, political, and economic turmoil, this chapter is also concerned with power and the impacts of colonial subjugation of Indigenous peoples and its current manifestations evident in various forms in the twenty-first century. Thus, this chapter first traces ideologies of conquest, imperialism, and development and their social, cultural, economic, and political impacts in the Peruvian highlands. The chapter then draws from archival and Quechua narratives in order to highlight Indigenous epistemologies, specifically in Quechua knowledge systems, that situate the Andean world as ecology of balance and struggle. Lastly, international discourses of environmental rights and human rights education in Indigenous education design and practice are discussed.

Due to increasing environmental problems, more evident than ever is the fact that human action is not isolated within the global ecosystem. While Indigenous populations in Peru are disproportionately impacted by exogenous-driven environmental exploits because of the ongoing colonialist desire for natural resources in their homelands, there are resounding effects on all populations – for example, climate change is diminishing subtropical glaciers, threatening water sources for agricultural production that feeds local and national populations. As a result, the links between development, environment and land, local peoples and epistemologies, and education and social justice could be explored towards solutions. This chapter addresses this in three sections: *I. The remaking of the Andean world: Colonial dominion over Quechua place, body, and thought* – focusing on ideologies of conquest, European-Catholic supremacy, and its persistence in current dominant Peruvian political discourse, which directly impacts how the identities of Indigenous peoples have been constructed by the European other for explicit purposes; *II. The dominant pathway to development* – discussing responses to Indigenous subjugation and marginalization through the language of social justice and Indigenous participation; and outlining Peru's participation in the development project and its discourses of modernization and progress, which require control over decision-making regarding Indigenous lands; and *III. Hawallaqtamanta (from the rural community): Land, memory, and Quechua education* – highlighting Quechua knowledge systems that originate from the rural community and that are complemented by Indigenous social movements, the language of Indigenous rights, environmental rights, and human rights education. Critical of colonial European ideologies and development spurred by *el occidente* (the West) and thrust upon Indigenous populations, the ultimate goal of this chapter is to demonstrate hope through distinct interpretations of Indigenous knowledges as vital undercurrents in education.

The Remaking of the Andean World: Colonial Dominion Over Quechua Place, Body, and Thought

Indigenous peoples in Peru remain the most historically marginalized, isolated, and exploited populations in the country. Further, Indigenous lands are threatened by discourses of progress, translated on the ground as development. As a result,

understanding Indigenous oppression is a unique task, especially if education-as-intervention is linked with social justice imperatives – meaning, understanding the current status of Indigenous peoples in Peru requires a deep interrogation of historical and colonial processes and current policies. Such analysis is a critical undertaking to any authentic dialogue of contemporary Indigenous peoples and education. Thus, this section examines three primary themes of colonial dominion in Peru, beginning with context on the Spanish invasion, followed by discussion of attempted conquest over Quechua place, body, and thought.

The Spanish Invasion of Peru

Prior to the Spanish invasion of Peru in 1532, the Inca Empire governed the Andes, spanning the Tawantinsuyu, Land of the Four Quarters – Chinchasuyu to the northwest, Antisuyu to the northeast, Cuntisuyu to the southwest, and Collasuyu to the southeast, areas today known as Colombia, Ecuador, Peru, Bolivia, Chile, and Argentina. Quechua was the language of the Incas spoken throughout these regions and remains a majority Indigenous language with an estimated ten million speakers, roughly over four million in Peru alone (Hornberger and King 2001; Hornberger and Coronel-Molina 2004).

When the Spanish military and clergy, financed by the Catholic church and Spanish Crown, arrived in Peru, they encountered established civilizations with existing political, social, cultural, religious, and economic systems already in place. However, meaningful acknowledgment of this is rejected in Peruvian society other than in anthropological books and in the tourist industry where Indigenous peoples, histories, edifices, customs, and attires remain rigidly fixed in a stunning yet vanquished past. For centuries, Quechua and Indigenous peoples in Peru have been characterized by others: the “problem of the Indian” outlined in government language from the colonial era to the present has boxed Indigenous peoples into static caricatures of a primitive past who are deterrents to progress (Sumida Huaman and Valdiviezo 2012). However, Indigenous scholars and allies have long since responded by reframing this so-called problem as a social justice challenge for all members of society to rebuild a more equitable and humane world (Valdiviezo 2014).

Part of rebuilding the colonial “world turned upside down,” as Indigenous chronicler Guaman Poma de Ayala wrote, is accomplishing what he strived to do in 1615 – creating dialogue regarding injustices against Indigenous peoples (1980). Recognizing how deeply entrenched these injustices are is an important step towards deconstructing the conditions of Indigenous peoples in Peru. Through narratives written by Spanish and Indigenous chroniclers during the colonial era, testimonies of the horrific treatment of Indigenous peoples by the Spanish exhibit the beginnings of Peru’s unequal socioeconomic and political system, both as a viceroyalty and later, as an independent nation. Colonial subjugation of Indigenous peoples linked with abuses and corruption by Spanish administrators and church clergy figures prominently in texts written in the 1500s by Bartolome de las Casas and Guaman Poma de Ayala who sent their work to Spain. Based on their work, this era can be detailed by

at least three distinct realms of violent military and political conquest: conquest of Indigenous places, conquest of Indigenous bodies, and conquest of Indigenous thought.

Conquest of Indigenous Places

Conquest of Indigenous places was an essential task towards establishment of enduring Spanish power over land as territory and personal possession versus Quechua conceptualizations of land and its fruits as “that which gives to the people” (translated from Quechua). Starting with the *encomienda* system, large swaths of arable land and Indigenous peoples on that land were given to Spanish elites. Later, these land grants became *haciendas*, where Quechua people labored ironically on their ancestral homelands to serve the *hacendado*, the Spanish landowner and master. This system of Spanish extraction continued into the 1960s until the Peruvian agrarian reform movement under the Velasco administration. However, justification for the stripping of land and forced labor was already deeply rooted through the issuance of Papal Bulls starting in the 1400s, like the Dum Diversas of 1455 and Inter Caetera of 1493, which validated the expansion of European empires through the Catholic church. Linked with the Catholic fervor of the Spanish Inquisition and justification of the church’s persecution of other faiths (Griffiths 1996), “discovery” of the new territories of the Americas prompted further justifications, permissions, and mandates for acquisition of all territories, people, and resources by the Spanish and Portuguese. Such documents represent some of the earliest records of land-grabbing, natural resource extraction, and slavery policies in the Americas. As a powerful entity bound to and more influential than the Spanish Crown (because of its believed direct pipeline to God), the Catholic church had the power to justify Spanish conquest and encourage expansion of empire as a God-given directive. Translated into current realities, dominion over places has manifested into projects of development based on dominant notions of civilization, modernization, and Westernization.

In addition to seizing of Indigenous lands and extraction of gold and silver, for example, Spanish supremacy was also established through urbanization. Because of the preexisting cities of the great Indigenous civilizations of Mexico and Peru, the Spanish constructed their conquest and evangelization through urbanization (Spitta 2007). In Peru, colonial urbanization required the dismantling of grand Indigenous architectural structures, the rebuilding and new construction of Spanish structures over Indigenous foundations, and the negation of Indigenous abilities to have yielded “truly civilized” and advanced architectural and urban planning. Peruvian comparative literature scholar, Silvia Spitta also illustrated that the number of Spanish cities – 225 by 1580, 331 by 1680, and by the end of the seventeenth century, almost all of the urban sectors now in existence – “highlights the extent to which the conquistadors immediately understood colonization as a conquest of place and urbanization of history” (p. 294). She argued that the Spanish quickly became urban settlers within an “inflexibly reproducible grid” that placed elite Spanish

administrators at the center of cities and relegated the Indigenous people to the margins, so accelerating race, class, and geographic placement.

Spitta also drew from the work of Sebastian Salazar Bondy, a Peruvian journalist who critiqued the descendants of the Spanish now the Peruvian elite oligarchy. He argued that these *Limeños* had created a superficial culture and livelihood based on exploitation and marginalization of Peru's Indigenous peoples, and he wrote scathingly of Peru's urbanites and those who wished to belong to this "high society" at the expense of their own dignity (1964). His class-consciousness arguments focused on the lasting effects of colonization on place and cultural production, where Spitta pointed out his observations of Lima inextricably linked past injustices with the present:

in this telltale spatialization of race and power even the dead are assigned a place—buried above ground in rectangular buildings, each coffin in an individual slot. Significantly, then, the pre-Columbian past that underlies the city has long been paved over and is conveniently forgotten in the national imaginary. Bones do not mix with bones; colonial and postcolonial remains do not lie next to pre-Columbian indigenous remains. Even the dead have to be segregated so that the past can be smuggled out of the present. (2007, p. 295)

The results of Spanish colonization through urbanization and the development of elite upper-class Spanish and *Limeño* urban identities as the superior class in Peru remain visible. Asserting or claiming *serrano* (highlander), *cholo* (Indian) or *nativo* (Native) identity can be tremendously challenging for Indigenous people, particularly youth who receive messages largely from mainstream media and institutions, including school, that glorify urban and "professional" lifestyles in comparison with dominant Peruvian society characterizations of rural life as poor, backwards, and generally lacking and uneducated Indigenous farming livelihoods (Crivello 2011; Sumida Huaman 2015).

Conquest of Indigenous Bodies

They forced their way into native settlements, slaughtering everyone they found there, including small children, old men, pregnant women, and even women who had just given birth. They hacked them to pieces, slicing open their bellies with their swords as though they were so many sheep herded into a pen. They even laid wagers on whether they could manage to slice a man in two at a stroke, or cut an individual's head from his body, or disembowel him with a single blow of their axes. They grabbed suckling infants by the feet, and ripping them from their mother's breasts, dashed them headlong against the rocks. Others, laughing and joking all the while, threw them over their shoulders into a river, shouting, 'Wriggle, you little perisher.' (Bartolome de las Casas 1992, p. 15)

The violence of the Spanish conquest played out most horrifically in Latin America through the conquest of Indigenous bodies – literally the killing of men, women, and children, and the forced marriage, rape, and abuse of Indigenous women by Spanish colonizers. At the physical level, Indigenous bodies were reduced to "things" (Freire 1970), viewed as labor commodities and slaves. Spanish

Dominican priest and chronicler, Bartolome de las Casas, accompanied the Spanish during their invasion of the Americas and witnessed firsthand the methods by which the Spanish brutalized Indigenous communities. Chronicling the devastation in the early colonial period in his *Short Account of the Destruction of the Indies* in 1542 and sent to Phillip II, he advocated for humane treatment of Indigenous peoples. Based on de las Casas' belief that rationality bound all men of the world, he argued for the peaceful conversion of Indigenous peoples whom he believed were made in the image of God and held understanding, individual will, free choice.

Of the widespread European colonization on the African continent, Kikuyu postcolonial scholar, Ngũgĩ wa Thiong'o proposed *dismemberment* (2009). He argued that multiple colonial acts, from defacing Indigenous cultural symbols and demeaning sacred sites to literal beheadings and mutilations of African bodies, were acts of colonial triumph intended to humiliate colonial subjects. Beyond conquest and humiliation though, lay the enactment of dismemberment as "the central character of colonial practice" (p. 5), a forced and violent separation of African personhood, continent, and diaspora through slavery, removal of Indigenous peoples from their lands, and European parceling up of African lands most evident through colonial demarcation and mapping of African homelands. Furthermore, he argued that dismemberment as an "act of absolute social engineering" had a clear capitalist modernization agenda from which Europe only benefitted. In Peru, dismemberment is triumph and humiliation over Andean bodies, the severing of Indigenous access and stewardship of ancestral lands and natural resources, and the denial of Indigenous capabilities to live self-sufficiently with dignity, to nurture their Indigenous knowledge systems, and to know themselves as indispensable cultural beings connected to social memory valuable to them and others.

Conquest of Indigenous Thought

So tell me, how is it you have put your hopes in a stone as if it were the true God, do you not see that this stone cannot understand what you ask of it? . . . If it could speak it would tell you, Indian, you are mad and blind. . . Do you not see that I am a stone, that the birds and foxes dirty themselves upon me, if I am a stone as you can see, how can I be God? (de Avedaño in 1649 quoted in Griffiths 1996, p. 185)

That there exists any question of Indigenous thought or intellect as valid and essential to national development, particularly through education, is telltale of the dominant social and political climate in which Indigenous people find themselves. Crucial to acknowledge is that such attitudes are endemic to Peruvian dominant society. The words of Diego de Avedaño, a Spanish Jesuit in colonial Peru, exemplified not only incredulity regarding Quechua beliefs about the Andean world, but also currently serve to diminish those beliefs as impossible or ludicrous. Writing in reference to Quechua beliefs that stone, *rumi*, and standing stone, *wanka*, were living beings, relatives, and could be sacred deities enshrined and adored by Quechua people who placed offerings for them, he argued that these things could not speak,

could not reason, were inanimate objects and therefore could not be deities. What sets such Spanish colonial assertions apart is not theological difference but rather the purposeful and resolute insistence of Quechua minds as voids, consistently and forever lacking – lack of religion, lack of morality, lack of intellectual capacity, and sense believed essential to civilization. Postcolonial responses have since worked to debunk as lore colonial narratives that propagate Indigenous ineptitude as inherent undeniable characteristics and that justify colonial control and establishment of society.

the oppressors attempt to destroy in the oppressed their quality as “considerers” of the world. Since the oppressors cannot totally achieve this destruction, they must *mythicize* the world. In order to present for the consideration of the oppressed and subjugated a world of deceit designed to increase their alienation and passivity, the oppressors develop a series of methods precluding any presentation of the world as a problem and showing rather as a fixed entity, as something given—something to which people, as mere spectators, must adapt. (Freire 1970, p. 139, Freire’s emphasis)

In order to make sense of dominant assertions regarding Quechua thought or intellect, Freire’s theorization of conquest is useful: conquest is antidiological action, and antidiological action is always present in conquest. In order to know the Andean world as a place of dialogical relationships, understanding how they have been disrupted is an important part of maintaining and reclaiming Quechua knowledge systems. Dismembering Indigenous connections to their stories, cultural practices, and values – their knowledge systems – is a necessary act of conquest in order for the colonizer to legitimize power. In order to maintain this power, and because those connections cannot be totally destroyed, the colonizer must then mythicize the world. This “world of deceit” – one that Salazar Bondy (1964) argued was invented by the Peruvian oligarchy employing Indigenous marginalization – must remain fixed in order to shift the identities of the colonized from considerers of their own worlds and bearers of their own imaginations to spectators who, at best, must adapt.

While this process is in reality nonlinear and there is much to be said of Indigenous agency, the repercussions of Spanish and dominant national political mythicization of the Andean world are evident, notably in the construction of formal education for Quechua children. In the colonial period, Spanish education embodied an agenda of transculturation, designed to transform Quechua people by instructing nonassociation where Indigenous identity was separated from markers of high (Spanish) civilization (Wood 1986). Since that era, defining characteristics of formal education for Indigenous peoples in Peru have been acculturation, citizenship, and the production and maintenance of “good workers” (Carnoy 1974).

Collectively, what conquest of Quechua places, bodies, and thought represent is the endemic quality of ideologies of imperialism that are founded in European-Christian superiority (Miller 2011) and antidiological worldview (Freire 1970). These ideologies were enacted and expressed through colonial strategies of dismemberment (wa Thiong’o 2009), which resulted in the remaking of the Andean world – Quechua land became Spanish-owned territories defined by Spanish maps; Quechua bodies became things to exterminate, humiliate, and exploit; and Quechua minds

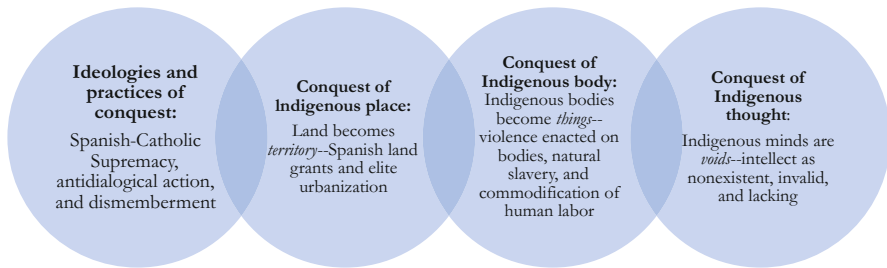

Fig. 1 Ideologies and practices of conquest

were reduced in colonial discourse to nothing more than simple, fillable vessels (see Fig. 1). As wa Thiong’o wrote, “Dismembered from the land, from labor, from power, and from memory, the result is the destruction of the base from which people launch themselves into the world” (p. 28). In the Andes, the attempted destruction of that base, which is at once sociocultural, political, economic, environmental, spiritual, physical, and intellectual, is not forgotten – and is evident at multiple levels, most obviously in public and political discourse and fixated on economic development.

The Dominant Pathway to Development

Peru’s colonial trajectory is not completed, and one of the underlying themes of this extension is the persistence of uneven power relations and dominant political reliance on exploitation of Indigenous lands and labor. One of the most seductive expressions of this dynamic is the discourse of national progress through development projects and towards modernization. However, because progress is largely defined by those in political power and the economic elite, modernization is seen as taking a singular path and projects of development as necessary, positive, and for the common good – ideas widely debated and globally refuted (McMichael 2010). Because Indigenous peoples have been historically fixed within a hierarchical social, racial, class, and economic structure in Peru, the need to deconstruct these discourses is long overdue, especially given that ideas of nationhood, progress, development, and modernization are never rigidly exercised.

This section attempts to contribute to dialogue by providing historical context of different perspectives of these ideas stemming from alternative imaginations (Chhetri and Chhetri 2015). Beginning with notions of resistance from the colonial period, *indigenismo* and its movements towards defining and achieving social justice are mentioned. Then, despite symbolic and intellectual shifts in resistance, persistent structural inequalities and dominant theories of economic growth are explored, followed by an example of a violent turn in recent Peruvian history. Lastly, exogenous projects of development through extractive industry and other environmental impacts are linked with the creation of poverty before

leading into the third section of this chapter, which explores why environmental devastation represents great loss for the world.

Indigenismo: Movements Towards Social Justice

Although injustice was widespread during colonization, there was resistance. Among the most visible was the armed Indigenous resistance in the eighteenth century through the military campaign of José Gabriel Condorcanqui, known as Túpac Amaru II, translated from Quechua as Fighting Serpent. In the Andes, the serpent is a deity representing Uqhu Pacha, the Inside World, and is responsible for cycles of creation and destruction. Starting in 1780, Túpac Amaru and his wife, Micaela Bastidas, led an Indigenous uprising against Spanish colonizers throughout the Andes. They encouraged Quechua people to take up arms against the Spanish and to fight for the return of their lands. Although he was captured and quartered in the Plaza of Cusco in 1781, the story of his resistance grew well into the twentieth century, and he has since become an iconic figure of rebellion against Spanish dominion, of the struggle for justice by the silenced and subjugated, and a symbol of Quechua political resistance.

Scholars have also offered that *indigenismo*, a Latin American political ideology, is the most recent in a spectrum of anticolonial resistances beginning in the colonial period. Indigenous peoples are at the center of a philosophical movement to value Indigenous ways of life and articulate their hopes for the future, to renounce exploitation of Indigenous peoples, to advocate for Indigenous rights, and to incorporate Indigenous peoples fully and fairly into national life economically, socially, and politically (Chang-Rodriguez 1984). Some of the most renowned proponents of twentieth century *indigenismo* were Peruvian journalists, novelists, and scholars. They were descendants of the Spanish elite who rejected class and racial discrimination, of mixed Indigenous-Spanish ancestry, from rural and urban roots, and primarily educated in some of the most elite universities, including the Universidad Nacional Mayor de San Marcos in Lima. Outspoken critics of racial and economic injustices against Quechua peoples, they publicly denounced descendants of the Spanish conquistadores and European immigrants who formed the capitalist elite class in Peru. Writing poetry on the Quechua peoples beginning in 1918 was César Vallejo; José Carlos Mariátegui wrote *Seven Interpretive Essays on Peruvian Reality* (1997) in the 1920s prior to his death at 35; and perhaps most moving was José María Arguedas, whose literary work in the 1930s until his suicide in 1969 focused on Quechua language and livelihood and their intersections with dominant society. Of those promoters of *indigenismo*, Arguedas's work not only provides some of the most compelling Quechua cultural elements using Quechua language (Arguedas 1972), but his work also has some of the clearest implications for education.

Arguedas produced some of Peru's greatest literary contributions in essays, novels, and poetry, including *Agua* (Water) in 1935; *Yawar Fiesta* (Blood Celebration) in 1941; *Los Ríos Profundos* (Deep Rivers) in 1958; *Todas las Sangres* (All the Blood) in 1964; and *El Zorro de Arriba y el Zorro de Abajo* (The Fox Above and the

Fox Below) published posthumously in 1971. Raised by Quechua, his writing is viewed by scholars as a hybrid of autobiography and class and racial commentary providing thick description of Quechua communities, people, language, and cultural practices. As a Quechua language speaker, his Quechua language phrases and poetry demonstrated his affiliation with Quechua people, admiration for the language, internalized pain at their oppressed social condition, and his belief in Quechua autonomy. He used his writing to describe Quechua isolation, resistance, and beauty in the Andes, and his work made clear that isolation on one's own terms and for the purposes of maintaining one's dignity represented possibilities in a dominant Peruvian society rigidly confined by its own unjust construction of the world. This construction had disrupted the Andean world to society's detriment through the denial and destruction of the cultural wealth of its original communities.

Arguedas was also a staunch proponent of recognizing Quechua peoples and lands as comprising Indigenous nationhood, which he believed had been subdued but not defeated due to their cultural wealth through folklore – Quechua songs and stories perpetuated in each Andean village. He advocated for appreciation of distinction of nations, which he believed could only benefit Peru. Based on his literary accomplishments recognized worldwide, before his death he was awarded the national Peruvian prize named for el Inca Garcilaso de la Vega, and in 1968, he accepted this award for contributions to the cultural arts. In his acceptance speech, he famously described his worldview with the hope that the “great nation of Andean lands” and the “humanized part of the oppressors” could unify:

And the path had no reason to exist, nor was it possible for it only to exist as an empire of victor plunderers; or that; the defeated nation relinquishes its soul, although not in appearance, formally, and takes from the victors, that is to say it acculturates. I am not acculturated; I am a Peruvian who proudly, like a happy demon speaks in Christian and in Indian, in Spanish and in Quechua. (Jose Maria Arguedas's “Inca Garcilaso de la Vega Award” acceptance speech, 1968)

“I am not acculturated; I am a Peruvian who proudly, like a happy demon speaks in Christian and in Indian, in Spanish and in Quechua” has been cited by those who support coexistence of Quechua and Spanish language and identities. The idea that one can strive to elevate the status of Quechua language and knowledge is one of Arguedas's most important contributions to education. Though lesser known, his work in education remains significant as philosophical inspiration and pedagogical motivation for Peruvian educational scholars and practitioners. As a teacher and teacher advocate, traveling through Andean communities in the 1920s, he observed national curricula in Quechua communities and its severe impacts on Quechua children in formal schools. In the 1930s, he worked with the Peruvian Ministry of Education as an expert on Peruvian folklore, which he argued was based in local knowledge and central to the education of Quechua children.

This isolated village, illiterate, however creates a very coherent conception of how actual man appeared and to explain who made the great works that exist in the pre-hispanic ruins, creates a different humanity. . . These people illiterate like this, isolated like this, humbled

like this, have an extraordinary capacity to make for themselves an image of this world, of its origin, and of its destiny. . . The teachers in each and every place where they are [should] inform themselves of all of these beliefs, because those beliefs are going to give them an approximate idea of what each individual of the community in which they work, of what each individual believes is this world, how it was created, for what it was created, and where it will end. (José María Arguedas, "The Importance of folklore in education," author translation)

Arguedas argued that education should not remain the same oppressive system, which he believed demonstrated dominant society's ignorance of Indigenous cultures, furthering the silencing of Indigenous peoples while preventing quality and effective schooling for Indigenous children. His ideas about education have since influenced scholars involved in rethinking culture and education in Peru, primarily by learning to valuing local folklore.

In terms of policy, through the 1940s and 1950s, attention was hoisted onto Indigenous communities, mainly Quechua villages where education became the focal point for greater inclusion of Quechua peoples into mainstream society. In 1945, Bolivia and Peru launched a joint country educational initiative, the Convening Project on Indigenous Education between the Governments of Bolivia and Peru. This was a plan to "incorporate the Indian into nationality as an active factor of production and consumption" and due to the urgent necessity for "immediate and complete cultural and moral rehabilitation" through education that would afford Indigenous people "the same opportunities in each country and recognize their equal rights and equal participation in civic responsibilities" (Giesecke Sara-Lafosse 2007, p. 180). Like subsequent national educational plans for Indigenous communities in Peru, the primary driver for formal education remained citizenship development and the production of workers and consumers to participate in the national economy and to ensure financial stability, which policymakers believed would prevent Indigenous civil unrest (Carnoy 1974). In addition, using *indigenista* recommendations to appreciate the cultural value of Quechua peoples, policies in formal education began to reflect suggestions for folklore in curriculum development (Giesecke Sara-Lafosse 2007). However, while recognition of Indigenous peoples through folklore was well intentioned, folklore was defined by evident cultural practices – Quechua songs, which contain themes about nature and values like love; Quechua stories, which tell of the origin of man, local places, and local elements; and Quechua dances, which are ceremonial and social and related to the seasons, the earth's cycles, and agricultural practices like farming and herding. Because of the way in which Quechua culture was interpreted by those in charge of designing educational policies and practices for Indigenous peoples, and because Quechua culture was essentially distilled to folklore, deeper understanding and value attached to the Quechua knowledge system could not permeate entrenched ideas of what constitutes knowledge, who Quechua people are, and what Quechua knowledge has to offer *within and beyond* songs, stories, and dances. Although Quechua songs, stories, and dances offer profound observations honed over millennia regarding the natural world and its cycles, because of their relegation to "mere folklore," the centrality of Quechua cultural practices and knowledge to formal education has since become difficult to

justify to educational policymakers and Quechua parents alike. Both groups ask why Peruvian children should go to school to learn stories and sing songs or to speak a language that has little value to a secure financial future in dominant society, which requires fluency in Spanish (and now English language acquisition) and rote learning to gain university entrance and preferably, an urban white-collar job (Valdiviezo 2009; Crivello 2011; Sumida Huaman 2015).

Persistent Structural Inequalities

Although *indigenismo* remains inspirational by addressing Indigenous equal participation and rights in Peru, cycles of domination are persistent. The example of folklore represents one of the most aesthetically pleasing aspects of Quechua cultural practice, yet incorporation of a song or story in a lesson is neither substantial nor significant recognition of the potential contributions of Quechua knowledges. In their work on American Indian boarding schools in the United States, K. Tsianina Lomawaima and Teresa McCarty developed the “safety-zone” theory (2006). Boarding schools for American Indians represented a federal government mandate for assimilation and civilization of Indian children, and while these schools did work towards these ends, they also allowed some tribal cultural practices and symbols to be incorporated into curricula and play. Lomawaima and McCarty argued that the federal government oscillated its policies towards Indian tribes, between restrictionism and permissiveness, reflecting deliberate mechanisms for control of Indian people: Some cultural practices are deemed “safe” to the mainstream, and some are not, and who decides is telling. Similarly, in Peruvian formal education policy, Quechua songs, stories, and dances are “safe” inasmuch as they maintain their aesthetic as markers of a quaint and colorful culture and nothing more. Quechua language is also “safe” as long as it is contained within superficial parameters, like names of streets or archaeological sites, which are useful to the Peruvian tourist industry. Quechua cultural practices and knowledges are safe as long as they remain symbols of an ancient past and a vivid present that can be used to promote authenticity and heritage to the world. Knowledge and cultural practices also remain safe as long as they do not threaten dominant mythicization of the world; that is, Quechua culture must not upset existing social and class hierarchies, and knowledge must not challenge dominant assumptions about the nature of the world and its resources as crafted by Western modern science, for example, and in the service of capitalism.

Resistance and dissent emerging from Quechua and Indigenous peoples in Peru has long since been a dominant national fear, particularly because those who comprise the ruling and European descendant classes in Peru are a population minority. Indigenous peoples and *mestizos*, the term for people of mixed Indigenous-Spanish ancestry, are estimated to form upwards of 80% of the national population. However, what should be noted regarding the classification of peoples in Peru is that the array of racial identities can be complex. The term *mestizo*, invented during the Spanish colonial era, is a widely accepted yet contentious categorization.

This is because Spanish domination of all things Indigenous was such a common trait of colonization in Peru that triumph over race represented an important victory for the Spanish colonizers – and they could claim that intermarriage with Quechua peoples was responsible for fathering an entirely new race. However, *mestizo* and the multiplicity of other racial categories that resulted from Spanish construction led to bipolarity of identity where a Quechua individual striving for upward social mobility might publicly claim more Spanish and European heritage, weighing the costs of Quechua ancestry, language expertise, family and community affiliation, and geography. Misconstrued as internalized shame towards heritage language, culture, people, and homeland, identity choices reflect racial discrimination and deep class and social stratification in Peru (Hornberger 1988).

The population of Quechua people throughout the Andean nations is so large that in fact, the need to cultivate diplomacy through cultivation of democratic principles in order to maintain national security and stability in Peru is also promoted by the United States federal government. Foreign Language Area Studies (FLAS) fellowships are provided to university students in the USA in order to study a less-commonly taught language that is spoken in regions of the world where the Department of State has interest. Quechua is a FLAS-funded language. Because of these agendas – national and foreign – Peru’s oscillation of education and language policies towards Indigenous peoples can be tracked, and for Indigenous peoples, there is little expectation that justice should be given by others. Also, the very nature of *indigenismo* and more contemporary calls for Indigenous justice are based on societal recognition of past injustices in order to collectively rectify wrongs and build a world of distinct nations who respect and need each other.

There was a brief historical period in Peru where manifestations of social justice did appear through top-down approaches. In 1968, General Juan Velasco Alvarado, a Peruvian military general, orchestrated a bloodless coup overthrowing then-President Belaúnde and taking power as the President of the New Revolutionary Government. Velasco remained in power until 1975 when he was overthrown by another military coup. Because of the laws and reforms he introduced, there are many critics of the Velasco administration, from the right wing to Velasco’s own left wing. However, at least three major laws he introduced created stirrings in dominant Peruvian society due to their intent to address inequalities towards Indigenous peoples: The first was land reform, which effectively ended *hacendado* rule over Indigenous lands and redistributed lands seized by the colonizers to Indigenous people; the second was bilingual education (which has since evolved into IBE, intercultural bilingual education) for Indigenous children; and the third was attempting to raise the status of Quechua through a law that made Quechua an official language of Peru.

Velasco’s political rhetoric appeared to usher in an era of reforms that would correct injustices of the colonial past. In his June 24, 1969, speech, he declared that from that time forward, the Peruvian peasant (i.e., Indigenous farm worker) would “truly be a free citizen, part of a nation that would recognize his right to the fruits of the earth that he works. . .no more as he has been until now. . .a man to be exploited by another man” (author translation). Through what he called his revolutionary

government, he instituted the Law of Agrarian Reform (Decree Law No. 17716), which re-appropriated some 15,000 properties totaling nine million hectares to Indigenous peoples. When he introduced the law, he appealed to a concept of national unity and spoke of the agrarian reform in defense of the humble peasants of the nation whose roots occupied shared national history and “whose image of justice emerges from our own and immemorial past.”

This is our greatest desire: To labor for our community and for its youth social legislation where man can live with dignity, knowing that he lives in a land that is his and in a nation where he is the owner of his destiny. . . . This is our greatest guarantee of true and just social peace in the future of our nation. . . . *To the man of the earth we can now say in the immortal and liberatory voice of Túpac Amaru: “Peasant, the master will no longer eat from your poverty!”* (excerpt from President Velasco’s Law of Agrarian Reform speech, Lima, 1969, author’s emphasis)

Velasco’s government, though short-lived, offered some critical ideas to Peruvian politics – that national development required justice for Indigenous peoples and that shared vision and actions towards social justice constitute nationhood. Such definitions of national development and nationhood linked with direct legislation and clear enactment are not evident in Peruvian public political discourse today.

There are also “realities” of the Velasco reforms that scholars have pointed out as failures of his administration. Critiques of the revolutionary government question whether or not its leaders, including Velasco, had a firmly defined vision of the future as well as a clear plan and strategies to achieve that future. Much of Velasco’s attention was focused on dismantling the Peruvian oligarchy and challenging those who would continue to exploit Peru’s natural resources and people. He gained the attention of the United States and foreign corporate interests by confiscating extractive industries and confronting multinational corporations (Walker 2014); he also drew from the imagery of Túpac Amaru in order to rally his movement around the symbolism of Indigenous resistance; and he produced political discourse that redefined concepts that had previously been used against Indigenous peoples by those in power. National development, modernization, and progress became goals that actually required the incorporation and direction of Indigenous peoples in society and to avoid further social injustice that Velasco believed would lead to civil unrest (Walker 2014). However, some scholars viewed a fatal flaw as the lack of unified vision within leadership that could sustain a socialist government beyond overthrowing the oligarchy (McClintock 1981). Participatory social democracy would easily be pitted against corporatism and capitalism, and this tension remains today.

The longevity of Peru’s oligarchy was not resolved during the Velasco administration. There remained strong critics of the land reform movement, and the emergence of research has helped to illuminate some of the tensions during this time period. Enrique Mayer’s work (2009) included, among other narratives, those of former *hacendados*. These and other explorations have acknowledged their research limitations while seeking to demonstrate the need for multiple stories to emerge from government-enforced policies. From a social research perspective, upper class elite stories

representative of Peru's oligarchy, which Velasco sought to overthrow, are a valid reminder to view policy and its immediate and historical impacts from different angles. However, the wealth inherited from Spanish colonialism and connections to current elitist ideologies and lifestyles must be made clear. At the same time, the lack of Indigenous perspectives and gendered and generational explorations regarding this time period is disturbing. Thus, as researchers we are cautious and aware that the history and legacies of Spanish colonialism told by Indigenous voices are made mutable when dominant narratives take center stage. The stories of Indigenous Andeans living in the *hacienda* system since the colonial period and well into the decade leading up to the Velasco administration are deserving of study and place in the greater social memory of all Peruvians. Further, in terms of driving research, the stories of *hacendados* and alternatively, the lack of Indigenous accounts, particularly using Quechua language and its varieties and based on participation and research direction from Indigenous community members offer us the question of how our inheritance defines our experiences. Whether we have inherited colonial wealth, status, and opportunity or poverty and denial of access born of foreign exploitation remind us that we alone do not create our destinies despite our best capacities or dreams.

Dominant Theories of Economic Growth

In Peru there remain significant tensions between those who believe that national development requires addressing inequalities and establishing social justice and those who believe that national development is based on capital gained through exploitation. The latter is aligned with Western ideas of economic growth and society, most notably W.W. Rostow's theory of economic "take-off." Take-off theory originated in the 1960s when Rostow proposed his economic growth model, since becoming development dogma. He argued that economic growth took place in stages: the first stage begins with what he referred to as a "traditional" society, typically agrarian (which he pitted against Western modernity) – "A traditional society is one whose structure is developed within limited production functions, based on pre-Newtonian science and technology, and on pre-Newtonian attitudes towards the physical world" (p. 4). The second stage requires preconditions for "take-off" where societies embrace the possibility of economic growth – an attitude that in many cases is exogenous through "intrusion by more advanced societies. These invasions—literal or figurative...set in motion ideas and sentiments which initiated the process by which a modern alternative to the traditional society was constructed out of the old culture" (p. 6) and where economic progress is qualified as good. Rostow viewed "take-off," as a watershed in modern human history – "The forces making for economic progress...expand and come to dominate the society. Growth becomes its normal condition. Compound interest becomes built, as it were, into its habits and institutional structure." (p. 7). During "take-off," investment and savings skyrocket. After take-off, there is a drive towards maturity and further self-sustained growth (p. 9), after which, the stages are completed through mass consumption beyond necessities. As a caveat, Rostow noted that final stage of economic

growth was not confined to static descriptors but contained deeper questions and choices that societies themselves would face. Reflecting on his theory 30 years later, he acknowledged that the stages of economic growth were not without global consequences, particularly with regards to strain on natural resources and pollution of the environment (1990).

While advocating for increased attention by governments towards international and public policy cooperation, Rostow nonetheless maintained his theory of a linear economic trajectory and definitions of societies therein. He believed some societies remained “trapped” in precondition stages that were neither traditional – due to the vast reach of technology in the modern age – nor capable of “take-off” without significant foreign intervention. These “late-comers,” as he referred to them, appeared to represent resistance/problems to economic development. Such rigid definitions of science and technology and compartmentalization of peoples without consideration of endogenous goals are problematic and limit possibilities of open and genuinely curious dialogue *with* Indigenous communities for whom science and technology may have different definitions, purposes, and applications.

Violent Turns

Beginning in the 1960s, *Sendero Luminoso*, Shining Path, propelled by Maoism planted seeds for what would become a violent guerrilla movement that escalated through the 1970s, 1980s, and 1990s (Stern 1998). Leaders of *Sendero* claimed to be waging war against capitalism and the marginalization and resulting poverty of Indigenous and other Peruvians due to foreign and domestic corporate and government greed and increased Peruvian dependency. Civil conflict ensued with Peruvian police and military clashing with *Sendero* soldiers and civilians and leaving approximately 70,000 dead or missing according to Peru’s 2003 Truth and Reconciliation Commission. Universities became battlegrounds as antigovernment sentiment through student and faculty protest or mobilization resulted in torture, killing, or disappearances during what has become known as “the time of fear.” Amnesty granted to military personnel left the Peruvian public and human rights watchers around the world questioning accountability for the lost lives, many of which were Indigenous. *Sendero* was also viewed as problematic based on their methods of communist indoctrination in Andean villages involving public executions and abuses of girls and women that resulted in multiple traumas from which Andean Indigenous communities are in recovery (Degregori 2012).

In some ways, the rise of this violent movement represented profound frustration of Peru’s most economically impoverished communities. Consistently among the poorest regions in Peru, Ayacucho, where *Sendero* was cultivated by university intellectuals, was like many other regions in the Andes, seemingly desolate and forgotten. Although there is no doubt that Peruvian citizens, including Indigenous peoples, are engaged in rebuilding and building nationhood, Indigenous voices are consistently muted by those in power. Maintaining a peaceful society then is also at risk: Despite the efforts of those in the Velasco administration to build a definition of

nationhood that upheld social justice through full inclusion of Indigenous peoples in Peruvian society, Western-based economic ideologies appear victorious.

Exogenous Projects of Development and the Creation of Poverty

In Peru today, power is most clearly articulated through economic gain on a large-scale and global level in extractive industry and exploitation of natural resources. Moreover, because economic growth is touted as beneficial for *all* Peruvians, any consideration of Indigeneity or unique cultural or linguistic knowledge will be challenged with regards to its relevancy to progress for *all*. In this political climate, the transition of conquest into development is unflinching and strengthened by international, multinational, and private interests.

Starting in the late 1960s, anthropologist June Nash began studying the participation of Indigenous peoples in tin mining in the Bolivian Andes. Her work was among the earliest depictions of the intersection of Indigenous identities and their reformations with participation in industry. She was concerned with the relationship between interpretation of experience and creation of action through the ideology of miners. Nash viewed Indigenous peoples as in great transition, referring to this as “cholification” or “Indianization,” using derogatory terms for Quechua peoples that were being repurposed by Quechua themselves. She argued that “Indianization” revealed both resistance and selective acceptance of aspects of the dominant culture. As far as resistance and self-determination were concerned, she believed that at their core was Indigenous epistemology, primarily the notion of *pacha* – space and time, and the energy that flows through all things. She argued that unlike workers in other industrial centers, deeply entrenched precolumbian roots, exercised through articulation of beliefs and rituals, gave Quechua a distinct and strong identity that served as the basis for their self-determination in creating a “new class definition of their national status” (1993, pp. 2–3).

Like other theorists questioning dependency and extraction in Latin America (Escobar 1995; Esteva 2010), Nash was also critical of ideologies of development reliant upon capitalism, which she argued were unsustainable. She was also a proponent of Indigenous-based inquiry regarding development on Indigenous lands, where Indigenous peoples were at the center of decision-making despite exogenous influence: “Only a redefinition of the aim of the development process which will put people at the center of planning and reject the exploitation of natural riches for short-run gains will reverse the situation” (1993, p. 16). Since her fieldwork, there have been some political changes in Bolivia not necessarily representative of other Andean nations. However, explorations like these provide important cases and comparative lessons regarding how an area once unified under the Inca, the *Tawantinsuyu*, which remains geographically and culturally linked, is dealt with by the states that govern them today.

Writing of Indigenous mobilization and social movement linked with land development in Argentina, vom Hau and Wilde (2010) not only critiqued dominant notions of development as did Nash decades earlier, but also provided Indigenous perspectives on the construction of poverty that have been emerging from Indigenous

mobilization and activism. Due to displacement from ownership of Indigenous lands – leaving Indigenous people in their own words, living on “captive lands” – and colonial political and economic control, Indigenous peoples had become the most economically disadvantaged population. But as vom Hau and Wilde also argued, because of their activism and promotion of rights, the very origins of poverty, its definitions, and its metrics were being addressed by Indigenous peoples: “The focus on the nexus between territorial rights, resource governance and indigenous wellbeing points to the poverty-creating processes of recent capitalist transformations” (p. 1298). They criticized research on “Indigenous poverty” as containing significant gaps due to lack of analysis on Indigenous agency and political subjectivities, the narrow focus on poverty as income-based, and perhaps most importantly, the ignored tensions between dominant definitions of poverty and how Indigenous peoples view their own well-being (p. 1287). Instead, they proposed that poverty is not endogenous to Indigenous ways of life, but rather is a relational condition created by economic injustice due to colonial and corporate control over land that is further exacerbated by “adverse incorporation of local communities into . . . new land and labour markets that threatens their subsistence strategies and economic security” (p. 1298).

Bebbington’s work on extractive industry in the Andes forms much of the basis for deeper explorations of the causes of poverty and alternately, endogenous and Indigenous definitions of wealth (2010). He argued that poverty is an outcome of particular relations of power and that although social movements emerge in response to these relations, their scope is not limited to issues of poverty when poverty is defined (by others) as lacking something; instead, social movements, “emerge to challenge dominant ideas as to how society should be organized, to draw attention to needs not currently attended to under existing social arrangements, to argue that existing arrangements need protecting and deepening, and to make visible identities rendered invisible or abnormal by prevailing relationships of power” (2010, p. 1). Because of their rootedness in Indigenous identities and ability to reconsider power relationships and inequalities and to articulate visions of how and by whom society should be rebuilt, one of the greatest accomplishments of Indigenous social movements is their power to shift the nature of public debate. Through social movement, which is a mechanism of ideological production – identities, discourses, visions, strategies, and change – Indigenous peoples create their own opportunities to articulate new ways of thinking about problems. Part of the problem with public political discourse, aside from its fixation with progress through development, is the faulting of Indigenous peoples for what is viewed as a homogenous and traditional state of being, which includes primitiveness and poverty.

If we are to challenge the constructs of poverty, we will need to define how capital is measured (Bebbington 1999), by whom, and for what purposes. We will also need to challenge what McMichael (2010) referred to as the “epistemic privilege of the market calculus” whereby the market is the dominant lens for understanding development, resulting in casualties that persecute, marginalize, and silence Indigenous “misfits.” When local Indigenous communities mobilize around their own questions, they defy and transcend their categorization, and there is incredible potential for Indigenous social movements to draw attention to how nationhood and progress are defined and lived, including rethinking poverty and Indigeneity.

Such mobilization has yet to dissolve unequal power relations that involve development on Indigenous lands in the name of national progress. In recent years, Indigenous-state tensions escalated, most publicly through what became known as the Bagua standoff between Indigenous peoples in the Amazon region of Peru and Peruvian police and military in 2009. Leading up to this confrontation were a series of decrees set forth by then-President Alan García and directly related to the 2006 US Peru Free Trade Agreement (FTA), which would open up protected Indigenous lands to foreign investment in development that the national government considered to be under-utilized by Indigenous peoples. On June 5, 2009, at the *Curva del Diablo* (Devil's Curve), road near the town of Bagua, Awajun, and Wampis Indigenous peoples clashed with government forces. For the USA, special concessions for investment through exploitation of natural resources in other regions around the world provide benefit for corporate and government interests; as a result, accountability regarding who is impacted and what ultimately happens in other places is not a factor if any intended gain is compromised. For Peru, manifestations of conquest over Indigenous lands remain a reality and not just historical cases. Then-President García argued that land that could be used for national profit was laid to waste by Indigenous peoples – and for him, what was “national” and who stood to gain never included Indigenous consultations.

There are millions of hectares of idle timber, other millions of hectares that the communities and associations have not cultivated nor will they cultivate, in addition hundreds of mineral deposits that cannot be worked. . . The rivers that go down from each side of the mountain range are a fortune that go to the ocean without producing electric energy. There are, in addition, millions of workers that do not exist, even though they do labor, well their work does not serve them to have social security or a future pension, because they do not contribute what they could contribute multiplying the national savings. So, there are many unused resources that are non-returnable, that do not receive investment and that do not generate jobs. And all because of the taboo of surpassed ideologies, for idleness, for insolence or because of the “law of the dog of the garden” who recites: “If I do not do it, no one can do it.” (Alan García, *El Comercio*, October 28, 2007, author translation)

La ley del perro del hortelano, or the “law of the gardener’s dog,” is a saying that refers to a dog who guards a garden: The dog does not eat the products of the garden, nor does he let anyone else eat of the garden. García applied this comparison to Indigenous peoples living communally in their protected homelands – like the dog, they would neither use nor allow anyone else to use the natural resources. Aside from the racist nature of García’s discourse or his apparent lack of concern regarding any long-term social or environmental consequences of natural resource extraction and exploitation, what is clear from his commentaries is the belief that Indigenous lands are primed for the taking – not unlike the language of the early European colonizers who saw “virgin” and “abundant” land occupied by ignorant people.

In addition, no matter how compelling the idea that the entire Peruvian population (regardless of their socioeconomic class and ethnic identities) could benefit from development, distribution of “benefits” and most importantly, prior consultation

regarding development on Indigenous lands and how Indigenous peoples view its implications remains unclear:

Value is taken from certain spaces and distributed to others. The spaces that bear the brunt of the externalities generated by extraction are in the vicinity of the wells, mines, pipelines and smelters, and in none of these three countries are environmental safeguards and regulations handled with the seriousness necessary to offset the risk that today's sites of extraction will be tomorrow's sites of contamination and reduced viability. Meanwhile benefits and opportunities accrue in other spaces – in departmental and national capitals and more generally in areas of demographic concentration. This seems to be exactly the same whether we are talking of the north of La Paz in Bolivia, Yasuni in Ecuador, or Rio Corrientes in Peru. And once again, these are spaces that are occupied by indigenous groups who have been systematically and repeatedly disadvantaged by national development models. That pattern shows no sign of changing, whether under neoliberal or post-neoliberal regimes. (Bebbington and Humphreys Bebbington 2011, pp. 141–142)

Andean countries hold significant natural resources highly coveted by corporations and nations around the world. In their commentary on extractive industry in Ecuador, Peru, and Bolivia, Bebbington and Humphreys Bebbington (2011) noted some important similarities: All three countries hold the expansion of extractive industry as the “pillar of macroeconomic strategy,” and government intolerance to resistance of this expansion is only increasing in ways that limit dissenting citizen voices through legislative reforms and criminalization of protest (p. 140). At the local level, the Peruvian example demonstrates that if expansion continues, conflicts may emerge from localities demanding greater shares of extractive industry revenue, thereby leading to inter-Indigenous community conflict (p. 141). Given possible health and environmental repercussions with long-term impacts on human populations at the epicenters of extractive industry, such trade-offs are not unexpected – and there are numerous cases of these in the Andes already. Furthermore, because the emphasis on these development dynamics is on Indigenous participation and negotiation, *Indigenous ownership and Indigenous management* of development is subjected to the cycle that Bebbington and Humphreys Bebbington referred to – value taken from Indigenous places for distribution to others. In order for Indigenous peoples to reshape this dynamic as more than spectators or minor recipients, shifting the nature of how the environment is viewed and usage of environmental resources through local and wider debate is a critical step that must be driven and maintained by, within, and among Indigenous communities who have the ability to demonstrate real and applicable ways that their knowledge systems and sociocultural identities matter in Peru and elsewhere.

Hawallaqtamanta (From the Rural Community): Land, Memory, and Quechua Education

Quechua communities base their ways of life on the Andean calendar, which is an Indigenous cycle of ceremonies and environmentally based activities. Every August marks the new year for the Andean calendar, and ceremonies conducted in Quechua

communities and in the Quechua language acknowledge the change of season and provide offerings to the Apus. Like many other occasions throughout the Andean calendar, this is a time of direct conversation between Quechua people and their environment for the purpose of mutually sustaining all life – trees and plants, lakes, water, rivers, animals large and small.

In the Quechua worldview, the link between environment, language, cultural practices, and Indigenous pedagogies is clear: Environmental resources *are* educational resources, as Steve Smith, Ojibwe STEM (science, technology, engineering, and mathematics) instructor asserted (Personal communication, 30 June 2016). Indigenous scholars and educators around the world have validated these connections through development of theoretical frameworks on Indigenous pedagogies, Indigenous research, and curriculum development with Indigenous communities that priorities Indigenous knowledge systems but also includes access to other knowledges (May 1999; Smith 2000; Pihama et al. 2004; Kawagley 2006; McKinley 2005; Aikenhead and Mitchell 2011; Battiste 2002, 2013). As the Andean world has been made and remade, and the destiny of Quechua peoples and our environment is debated in public political discourse using economic metrics, how Indigenous peoples will engage and using what tools is unprecedented. Building on the preceding sections that outlined limitations imposed upon Indigenous communities, this section highlights major themes and strengths in Quechua knowledge systems and their relationship to education; in other words, addressing what Quechua people are fighting to protect and why this struggle matters.

This section begins with general characteristics of dominant and Quechua education, followed by description of Quechua lands and pedagogies as educational resources where our knowledge, yachayninchis, is education in situ. Because Quechua educational resources are threatened by projects of development, this section is therefore also concerned with environmental deterioration and neglect. By describing the impending loss of an Andean god, impacts on the perpetuation of Quechua knowledge for future generations are examined. Lastly, international discourses of environmental rights and human rights education and their usefulness in Quechua education design and practice through *Indigenous rights education* (IRE) are discussed.

Dominant Education and Quechua Education

Since Spanish colonization, the role of education as cultural imperialism (Carnoy 1974) has been to subordinate Indigenous peoples through strategies of European indoctrination and assimilation that have served to invalidate Indigenous knowledge. Because education is a powerful method of instilling nationhood and citizenship (defined by others), schools have assumed a central role in the production of Indigenous children for the purposes of the state. Formal education, like progress or development, is often singularly defined, executed, and assessed. As a result, deconstructing schooling for Quechua children requires steady interrogation of the purposes of formal education. Today, Quechua knowledges do not factor significantly in state-sponsored formal education of Quechua children, which can be

argued is indicative of the colonial inheritance that all Peruvians have received – the notion that first, Indigenous people do not know anything of worth, and second, that what they do know is superstition and a marker of their ignorance.

Valdiviezo's research (2014) demonstrated key trends in public and political discourse in Peru that she argued persistently characterize Indigenous peoples to the detriment of actual support of Indigenous knowledges in Peruvian education: Indigenous people's beliefs are absurd and backward (including language, knowledge, and cultural practices); Indigenous people are an obstacle to development (and deterrents to national unification, for example); Indigenous people are less than citizens (despite the 1993 Constitution that establishes Indigenous peoples as citizenship, "real" Peruvian citizenship is a privilege based on socioeconomic status, race, and ethnicity, and not a right); the purpose of formal education is to defeat or fix Indigenous peoples (a tool of civilization to correct Indigenous people of their absurd beliefs and to bestow culture upon them). At the same time, the allure of formal education for Indigenous peoples is undeniable as schooling promises a means to better oneself through increased social mobility and white-collar employment (Valdiviezo 2009; Sumida Huaman 2015).

Some of the most compelling research on learning and teaching in Quechua communities focuses on the role of the community as the primary teacher of Quechua children within Quechua spaces. Since the seventeenth century through the writings of Inca Garcilaso de la Vega who detailed Quechua ways of life and beliefs, to Arguedas's advocacy for folklore as legitimate knowledge and pedagogy, to contemporary in-depth educational research on Quechua children in Andean communities (Gutierrez-Verastegui 1986; Cerron-Palomino 1989; Calero Pérez 1996; Bolin 2006; Sumida Huaman and Valdiviezo 2012; Ames 2013a; Valdiviezo 2013; Sumida Huaman 2014), the fact that Quechua community members impart distinct local environmental-cultural knowledge to their children has been well established. Yet the interdisciplinary rigor of Quechua knowledges, in-depth explorations of how knowledge is exchanged, and why Quechua is significant beyond the local are not priorities in the construction of formal education for Quechua children. More often than not, the intellectualism, values, and problem-solving capabilities of Quechua peoples are undermined, which has fit well in the colonial trajectory. Today especially, marginalizing Indigenous epistemologies conveniently erases any notion that the earth is sacred, a worldview that contradicts widespread exploitation of the environment and expansion of extractive industry across the Peruvian Andes and into the Peruvian Amazon. Furthermore, if we consider that Quechua education has functioned for generations according to seasonal cycles and engagement with the environment through cultural activities that serve *sumaq kawsay*, a beautiful life for all, disrupting reciprocity for human gain alone is a strange proposition.

Pachamama ñuñunchis (Mother Earth Breast Feeds Us): Quechua Land, Knowledge, and Ways of Knowing

Throughout the Andes, agriculture is based on recognition of Andean seasonal cycles detailed by daily and ceremonial events: the preparation of the earth for the

planting (July and August), planting season (September and October), maintenance of the emerging and growing crops (November through April), and the harvest and new seed selection (May-June). Each stage of the life of plants is accompanied by ceremonial organization and participation of farmers and their families and communities. During the preparation of the earth for planting, new village leadership will be selected to oversee the entire agricultural year and to ensure the collaboration of community members with each other and the natural world through the ceremonies that are conducted. In the Mantaro Valley of Junín, for example, the season begins with offerings to the Apus and the planting of the fields of the deity protectors of the community. This is a tradition that though altered, endured the conquest when Catholic saints replaced Quechua curacas, spiritual heads, as the caretakers of those fields. This ritual planting, across the Quechua highlands, continues according to the belief that no one but the Apus has benevolence over these lands and that what *ayllpanchis*, the land, gives is a blessing (Photo 1).

Quechua farmlands, like those found in the Mantaro Valley of Peru, are rich in varieties of corn, potatoes and tubers, quinoa, and other grains. The early Spanish found that there were almost as many plants cultivated in the Andes by the Quechua as there were in all of Europe and Asia combined, and today the Andes remains one of the continuously cultivated original Indigenous agricultural centers in the world where the majority of Andean plants have been cared for by Quechua people for over 8,000 years (Valladolid and Apffel-Marglin 2001, p. 652). Writing about the history of Peru's *El Proyecto Andino de Tecnologías Campesinas* (The Andean Project of Peasant Technologies, PRATEC), Valladolid and Apffel-Marglin further argued that

Photo 1 Corn harvested in the Huaman Carhuamaca family *chakra* in the Mantaro Valley (Image by Elizabeth Sumida Huaman)

Quechua cosmovision is directly linked with Indigenous scientific knowledge that has yielded the crops we see today.

Family- and community-scale farms averaging several hectares or more provide for Quechua subsistence, as well as for local and other markets. These farms (*chakra* in the Quechua language) are considered the means to a good life in the Andes and represent their own ecosystems within the Andean world. Quechua believe that the Andean world can be understood according to *hanaq pacha*, *kay pacha*, and *ukhu pacha* – the upper world (of the skies and heavens), this world (of living plants, animals, elements, and humans), and the inside world (the world of our ancestors). These interconnected worlds are watched and cared for by deities, and they are also mediated by human beings who have a responsibility to acknowledge the beings in each world and to care for what has been given. Complementing this familiarity with the Andean world is the fact that the central Andean regions have the greatest ecological density in the world and that eight of the eleven world climates can be found here – making weather in distinct zones variable, to which Andean farmers have long since understood how to mitigate and accommodate culturally and scientifically (Valladolid and Apfeel-Marglin 2001, pp. 653–654).

Like other significant places in Andean communities, the *chakra* and its sustainability as a provider is a place where exercise of Andean cosmology is required, and is therefore more than just a space that produces the foods that people and animals consume. In the *chakra*, one encounters rich soil, surrounding fruit trees, worms, and insects. With the sun, moon, stars, clouds, and rains overhead, seeds are planted, nurtured, and grow. Entering the *chakra*, recognition is given to these elements, as well as to the ancestors who set their bare feet upon this soil to cultivate this land generation after generation. Offerings are made prior to planting and throughout the agricultural year, and it is not uncommon to see farmers offering coca to the elements or to see a newly planted field with beautiful fresh flowers placed upon the earth – communicating the hope to the earth, ancestors, and other community members that this *chakra* yields beauty. The physical and spiritual labor that is dedicated to the *chakra* is demonstrated by many acts throughout the Andean cycle of life – daily work and special times like harvesting are complemented with offerings, prayers of hope and prayers of gratitude, and any losses of crops are considered loss of life, seen as deaths in the community.

On the one hand, agricultural losses represent stark economic problems for Indigenous family livelihoods and for the overall Peruvian economy and Gross Domestic Product; on the other hand, exogenous environmental destruction represents yet another shift for Andean Indigenous ontologies – demanding multiple and innovative interventions and strategies. Because Andean communities have been reliant on small family- and community-scale subsistence farming for thousands of years, Quechua livelihoods are dependent upon ancestral practices of cooperation and reciprocity, like the *ayni*, kinship sharing reflected through collaboration in work. These are not individualistic ways of being, and Quechua ways of knowing assert the power and promise of the collective – people caring for people, the environment caring for people, and people caring for the environment (Photo 2).

In addition to organizing the agricultural life of a Quechua community and the ceremonies associated with each stage of the life of the plants, the greater context of the Andean calendar is the Quechua understanding of the universe and the role of runakuna, people, in the universe. Runakuna are part of creation, living beings who like every other living entity and contain the life force of the universe within them, and in order to honor this life, ceremonies are carefully planned and carried out throughout the Andean year and are inextricable from the Quechua agricultural cycle, the Quechua pastoral cycle, and so forth. Figuring centrally in these ceremonies are the deities and elements associated with hanan pacha, kay pacha, and ukhu pacha. However, because the term Pachamama is often interpreted in popular culture according to its literal translation to English from Quechua – pacha for earth and mama for mother – the deeper philosophies within the Quechua language and the Andean world are often misunderstood or oversimplified. That Pachamama is Earth Mother and feminine does not actually do justice to the complexity and centrality of pacha in the Quechua knowledge system. While Pachamama can be applied in one sense in reference to the earth, pacha is space and time and refers to the dynamic changing nature and energy of the universe. Although Western anthropologists have written extensively about pacha in Andean cosmology, if Indigenous peoples are the bearers, perpetuators, shapers, and innovators of their own knowledge systems, the ways in which they understand their own philosophies and how they wish to represent that knowledge needs to be much more richly explored. Space needs to be created, expanded, and defended in order for this to happen.

Although Quechua peoples have rich oral traditions, their reliance on orality as a method of transmitting cultural teachings does not preclude them from sharing knowledge that they decide to share in written form. Since the colonial period, Quechua scholars have been demonstrating their ability to utilize Quechua and Spanish languages, orality and literacy, Quechua cultural practices and resources, and Spanish resources and tools. Scholars like Don Diego de Castro Titu Cusi Yupanqui wrote his own narrative account of the conquest based on oral history

with Inca peoples in 1570; published in 1609, Garcilaso de la Vega wrote a detailed account of Inca life, landscape, and religion prior to the conquest; and in 1613, Don Juan de Santa Cruz Pachacuti Yamqui Salcamaygua wrote a detailed account of Inca life. All of these works focus on Quechua people, ways of life, and beliefs associated with rituals. In addition to what can be collected through oral histories in direct participation with Quechua peoples living in Andean communities, these works constitute yuyayninchis, our shared social memory. Yuyayninchis, our memory, and yachayninchis, our knowledge, are inextricably linked in Quechua knowledge systems, based in pacha.

Quechua knowledge systems (I refer to Quechua knowledge systems as plural since there are vast Quechua landscapes, communities, and language varieties. The argument here is to offer and protect opportunities for local peoples to explore their own knowledge systems while recognizing some potential shared elements outlined in this section of the chapter.) are rich, detailed, complex, and dynamic. These systems and Quechua ways of knowing – exercise, practice, conservation, and vitality of what is known – are still in existence in the highland Andes today and constitute the learning that Quechua children experience outside of formal schools. Research by Indigenous and non-Indigenous scholars over the past two decades has demonstrated this in different ways: From the work of Rosina Valcárcel who wrote in the 1980s of the prominence of Quechua myths as resistance to colonial domination (1988), to Patricia Ames whose work focuses on out-of-school learning processes and transitions in the lives of Quechua children and tensions with formal schooling injustices (2012, 2013c). In an attempt to contribute to this conversation on not only how Quechua knowledge systems can be identified, but more importantly, how these constitute Quechua learning within Andean communities, some major themes are identified here.

1. **Quechua knowledge systems are organized systems of knowledge for living in the natural world** – Pacha Mamamanchispi lluy kawsaqkuna: sach'akuna, gochakuna, unukuna, mayukuna, uywakuna hathunraq, huch'uyraq (Note that I use the Quechua Collao variety in this chapter, and the sentences in Quechua are not intended to be translations of the English phrases. Rather, they are assertions of what is stated using Quechua daily language.): Within Quechua knowledge systems, all elements are interdependent. Language is inextricable from philosophy, and philosophy is inextricable from values. Based on the Andean cycle of life, Quechua knowledge systems are organized and purposeful towards a good and balanced life for all beings. There are clearly defined responsibilities for human beings and protocols for engagement with all elements in the universe – from the sun and moon, heavens, and stars, to the rivers and trees and animals, to the ancestors.
2. **Quechua knowledge systems are local paradigms of place concerned with universal thriving** – Lluy runakunapas munayta ñawpaqman puririnanchispaq: Quechua knowledge systems constitute Andean ways of viewing the world through living within a particular context. However, the universe is broad, and local worldview is matched with conscientiousness of life in other places and is

deeply concerned with far-reaching impact as understood through *pacha*; space and time are not limited.

3. **Quechua knowledge systems are flexible and adaptable** – Chay tomaqakuna Español nisqa runakuna llaqtanchisman chayamusqankumanta pachan, kay Pacha Mamanchistaqa qhellicharanku, “idolatría” nispa manaña Pacha Mamanchisman Haywarikuyta qorankuñachu, inkakunata soq’ayuspa qonqachiyta munaranku, ichaqa Inkakunaqa manan kawsayninkuta qonqayta atirankuchu chayrayku pakallapi ruwaqku, Pacha Mamanchismanqa Haywarikullasqakupuni, ichaqa españolkuna mana chaypi iñisqakuchu, chayrayku Pacha Mamanchis kunan wañunayashan: Because knowledge is not bound by space and time, Quechua knowledge systems are based on fluidity and equilibrium. While the Spanish conquest and European notions of superiority continue to influence Quechua ways of life and people, knowledge from other cultures and their practices can be gained if deemed useful and respectful of the Andean world. Additionally, the visceral and real impacts of the conquest and current environmental threats to the Andean world are processed within Quechua knowledge systems and become part of what is known, *yachayninchis*, and what is remembered, *yuyayninchis*. Within what is known and what is remembered, what is learned and experienced, solutions to current problems can be explored.
4. **Quechua knowledge systems are vital dialogue and exchange** – Pacha mamanchiswanqa rimananchispuni sapa púnchay, Pacha Mama: qori montera, qolqe pullera, qanmi ñuñuwankiku, qanmi uywawankiku, qan patapin noqayku wawaykikuna kawsayku, noqaykutaqmi “español” runakuna chayamusqankumanta pacha usa hina kawsashayku yawarniykita soq’ospa, manataq qanta allintachu qhawarishaykiku: Quechua knowledge systems are concerned with sustaining all life in the Andean world and maintaining balance with the universe. These systems exist alongside other knowledge systems and are therefore vital. Pedagogies are intricately involved and rooted in the practice of relationship through conversation with the universe – that humans and other living beings, including plant life and animals, maintain a relationship with each other through communication and reciprocity. Not only are ceremonies acts of conversation between humans and the universe, but also there are stories that teach the value of conversation, such as the exchanges between corn plant and *yuyu*, an edible herb, that grows among the corn (see Photo 3).
5. **Quechua knowledge systems nurture individuals and community through learning and teaching** – Allinta yachananchis, umanchispi allinata hap’inanchis: Experiences within Quechua knowledge systems are facilitated by community members of all ages who direct, facilitate, learn, and participate in its practices; from the community healer to the youth learning to irrigate a field for the first time, each community member is recognized for particular talents, characteristics, and for their abilities to share these within the Andean world.
6. **Quechua knowledge systems are concerned with values towards harmony and justice** – Kamachi simikuna: More profound than socialization or construction of nationhood, Quechua knowledge systems are concerned with the cultivation of values of justice in each Quechua person throughout their entire lifetime. The ideal

Photo 3 Chakra with plants and flowers conversing with the corn in a southern valley of Cusco (Image by Elizabeth Sumida Huaman)

Quechua is often described as *umayoq*, *sonqolloq*, *kallpayoq* (possessing a good mind, possessing a good heart, and possessing strength). Within the *chakra*, teaching and reinforcement of other values during every stage of the growth of plants – respect, love, humility, thankfulness, and sharing – are shown to the elements, crops, and other community members through daily and ceremonial practices.

7. **Quechua knowledge systems are Quechua illumination and innovation** – *Ñawpaqman puririy, t'ikariy*: The Quechua knowledge system is interdisciplinary and holds principles of science, technology, engineering, art, mathematics, history, and social studies. Western discourses of knowledge separate these, but to Quechua, they are inextricable from each other and the natural world. Innovating and creating new approaches for sustaining Quechua ways of life and bringing solutions to problems is inherently the work of the Quechua knowledge system (see Photo 3): science in the form of agricultural cultivation and astronomy, technology in the form of advanced irrigation, engineering in the design of hydraulics, art in the form of sculpture and goldwork, and mathematics in the form of textile and architectural design (Photo 4).

This is not a classification of Quechua knowledge, but rather an offering of some observable patterns and continuities. Moreover, because knowledge has been

Photo 4 Inca hydraulic engineering work of Tipón (Image by Elizabeth Sumida Huaman)

commodified in the mainstream (May 1999; Valladolid and Apfeel-Marglin 2001), the purposes of knowledge are important to explore; in this process of inquiry, we can begin to distinguish Quechua knowledge as a way of living in the world from a body of thought whose metrics are based primarily on acquisition for human gain.

The Fall of a God

The Quechua knowledge system is vast and rich. As a structured and organized system of knowing the Andean world and maintaining a relationship with the universe, this system is also crucial to the sociocultural identities of Quechua children. For the past few decades, scholars working with Indigenous communities in Peru have amassed arguments regarding the local, national, and global benefits of these distinct identities (Zúñiga et al. 1987; Valcárcel 1988; Hornberger 1988; Aikman 1995, 1999; López 1996; Sumida Huaman and Valdiviezo 2012). No Quechua individual should have to justify or seek validation from dominant society regarding the worth of their identity. However, because of the longitudinal power inequalities resulting in silencing, marginalization, outright hostility, and negation of

Quechua as intellectual or anything other than primitive at worst, aesthetic only at best, there is a need to establish a baseline of respect for Indigenous knowledges – that Quechua knowledge systems and Quechua people contribute to world knowledges in ways that are productive to the survival of our own and other species. The threats to life today are unprecedented, and although not of Quechua making, when their knowledge is threatened and undermined, so is their human potential to repair the world.

Waytapallana, they say, is a man and woman. He is not alone. . . All of the flowers that the people are starting to bring now grow on Waytapallana—the flowers for Tayta Shanti—the woman protects the flowers the people go to pick. Look, if you have a noble heart, if you are pure and peaceful and enter to pick flowers, nothing will happen to you. You can cut the flowers peacefully. However many you want, you can bring. But if you go to the place, our Tayta Apu on Pachamama, they say when you enter Pachamama, she knows who you are. They say that maybe you are easily entering to pick flowers, but you become lost little by little, being tempted by prettier and prettier flowers—Just like that! You can disappear into the mountain. Pachamama knows all the feelings you carry, who you are. She studies the people. (Mama Yolanda, Fieldnotes 1997, author translation)

In 2004, Mama Yolanda, a Quechua Wanka speaker and community member living in the Mantaro Valley of central Peru passed away leaving her own legacy of Quechua stories told through the oral tradition and intimate knowledge of every section of her homelands that she passed on through daily interaction to her family members. She spoke of local shrines, wari or sacred places, farm fields that all carry Quechua names, the stories behind ceremonies, and of the mountains and their deities. Waytapallana, a glacier visible from her family house in the small Andean community in which she was born, is one of the special places she described (see Photo 5). Known in Quechua stories as related to the deity, Huallallo Carhuancho, the mountain glacier is affectionately called Waytapallana, the place where the flowers are picked, and this glacier is a landmark in the region that is central to ceremonies in the Andean calendar. Surrounded by glacial lakes, flowers that are used in ceremonies are ritualistically gathered from this place. As Mama Yolanda explained, this deity is not alone, but part of a family of mountains and peaks. Furthermore, she described the relationship that people have with this place and the earth and what type of *heart* it takes in order to even walk in the area. Her understanding of this place and her emphasis on human responsibility are vital elements in Quechua knowledge – that places are not removed from human emotion and intention.

In addition to its cultural significance, Waytapallana is also significant as a water source for this region and for the nearby capital city of the region of Junín, Huancayo. Western modern science views the Mantaro basin as distinct in Peru due to its biodiversity, natural reserves, and its glaciers like Waytapallana – which is arguably the most important glacier in the basin (Lagos 2007). With an elevation ranging from 4800 to 5768 m, Waytapallana is part of the Cordillera Oriental of the central Andes and located approximately 32 km from Huancayo (Quispe Palomino 2010, p. 15). As Mama

Photo 5 Waytapallana glacier (Image by Elizabeth Sumida Huaman)

Yolanda also acknowledged, Waytapallana is part of a complex of other mountain peaks including Yanaucsha, Lasuntay Grande, Lasuntay Norte, Cochás, Chuspi, Chulla, Ichu, Yanacancha, Tello, Rangra, Talves, Putacocha, Anchigrande, Chonta, Palpacocha, Champacoto, Pacaco, and Panchamayo; collectively, these form approximately 25 black, green, blue, and turquoise glacial lakes, which feed into various rivers that are connected to villages across the region (Quispe Palomino 2010, p. 16).

In the Mantaro region, not only is food grown locally by Quechua farmers for family and community subsistence, but also for commerce and trade (i.e., crops are routinely sent to Lima). However, this region is also under severe environmental threat due to sources with deep histories of colonial domination and neoliberalism – soil and water contamination through use of pesticides since the US introduction of DDT to the region post-World War II, water contamination of the Mantaro River due to regional mining projects, and perhaps most visibly to Waytapallana, climate change – which scientists believe is not likely to improve (Mark et al. 2010). Since the 1980s, Waytapallana’s icecaps have been melting, and over 50% of the surface area of the glacier is estimated to have been lost. This loss represents cultural challenges coupled with inevitable complications for water consumption and agricultural sustainability.

Carefully crafted documentation of significant places in the Mantaro region paired with local narratives and commentary was provided by Father Jaime Quispe Palomino of Huancayo in 2010. He described his work as addressing the urgency of growing the consciousness of human ecology to understand and curb the destruction

of the environment. He divided his work into three areas: the deterioration of the environment through contamination and its death and destruction; the current state of local animals also Indigenous to the region; and an exaltation of the land, the animals, and the universe. As in Father Quispe Palomino's work, reports emerging from the region have been conveying compelling testimony regarding environmental loss: Increasingly since 2011, news media has reported on the recession of Waytapallana and its projected impacts both locally and nationally. *El Diario del Comercio* began tracking local government efforts in Huancayo to conserve the region and protect Waytapallana from further losses. On December 7, 2014, *La República* described the loss of Waytapallana as "the fall of a giant" and described scientific projections based on the current rate of recession that Waytapallana will disappear by 2050. *La República* also reported that La Comunidad Andina de Naciones (The Andean Community of Nations) warned that as a result of glacier loss across the Andes, 2020 would see problems with access to water for human consumption, agricultural use, and hydroelectric energy, impacting an estimated 40 million people. Culturally speaking, the loss of Waytapallana is unimaginable, and there are no Western scientific projections to describe such an impact on Quechua knowledge and memory:

The legend of the origin of Huaytapallana tells of the confrontation between the gods Huallallo Carhuincho and Pariacaca, due to the daughter of the first, a beautiful girl called Huaytapallana. The son of Pariacaca tricked her and in reprisal, Huallallo Carhuincho killed him. Pariacaca took revenge, in turn, drowning the girl in the lake Carhuacocha. The war between the two gods was bloody and only ended when Wiracocha intervened, and he converted them into the snows on top of the mountains of Huancayo and Huarochiri. The legend says that on the day that the snows melt, the gods will return to govern the land of the Huancas. It seems like that day grows closer. (Miranda 2014)

Given the widespread impact of environmental damage both caused in Peru and elsewhere that has resounding effects throughout the globe, the loss of Waytapallana appears imminent. While local and national governments using international research support seek to address the vast loss of these resources in Peru, local community members throughout the Andes consider the direct impacts to their lives. There is increasing attention towards the intersection of physical risk associated with the direct impacts of glacier recession and vulnerability – from susceptibility to resiliency as response to environmental degradation – most critically appearing in studies of political ecology (Trigoso Rubio 2007). What we see is an epistemological clash – between Quechua knowledge and environmental exploitation based on progress exemplified through neoliberalism, and where direct impacts are immediately observable on local people who contend with the future in unprecedented ways. Respecting and caring for local environment, loving the chakra and earth, and being humbled by and gracious with what has been given are in opposition to dominant economically driven ideologies of natural resources. In light of explicit losses due to environmental degradation, we also see that Quechua values and stories do have critical relevance to science and ecological planning after all.

Indigenous Rights Education (IRE)

While Quechua are aware that their knowledge systems are beneficial for human behavior and understanding towards peaceable living with the universe, the fight in contemporary political discourse to demonstrate how and why this matters has been underway for decades. Framed as a reflection of collective conscience, critical Indigenous stories take on political power distinct from that which has been misappropriated by dominant Peruvian society as merely rural beliefs or folklore. While acknowledging modes of Andean resistance, Andean communities and scholars are transcending resistance; they are building new discourses and responses that position Quechua knowledges at the center of the conversation on progress, development, and nationalism. Education, both out of school learning processes and formal schooling, is paramount in such endeavors as state control over spaces where learning occurs is increasingly confronted by Indigenous peoples.

Questions around how education in both spaces can be constructed for the benefit of Indigenous peoples are clear. Quechua knowledge systems and discourses of human rights (HR) and earth rights have been useful in framing positions of Quechua knowledge in human and environmental interaction. However, in Indigenous terms, there are important critiques of the language of rights as state-sponsored, endorsed, or recognized. Tsalagi scholar Jeff Corntassel's work offers critical insights in this regard by rejecting state-recognized discourses that are distracting to Indigenous empowerment – where Indigenous peoples reframe rights as *our inherent responsibilities*, reconciliation as *resurgence*, and resources as *relationships* (2012). I do not dispute this, and the hope would be that local Quechua peoples and Indigenous peoples engaged in monumental and persistent environmental and educational battles would reframe the language of rights using Indigenous philosophies and languages. In Quechua, this might be along the lines of *chanin*, or justice in English, and its accompanying stories and cultural practices. However, for the time being, the discourse of rights is employed by Indigenous community members asserting Indigenous presence in national and international arenas. Furthermore, in light of ever-growing projects of development and environmental consequences in Peru and across the Andes, the how-and-why-Quechua-knowledge-matters justification is now more apparent than ever: In order to equip generations with the language and tools to lead and manage their own natural resource interests with local and global accountability to people and places, international discourses of rights (re)framed locally create and hold space for Indigenous peoples to place themselves in conversation from which they have been excluded, if they so choose.

Indigenous rights education (IRE) is a tool to expand Indigenous epistemologies in connection with community-driven educational goals that must interact with the state. IRE is founded in local Indigenous knowledge systems, including what and how local Indigenous peoples determine is vital to their ability and the ability of the beings and places in which they live to thrive (Sumida Huaman 2017). An example of this is collectively exhibited in the United Nations Declaration on Indigenous Rights (UNDRIP). Stemming from local Indigenous knowledge systems, IRE is linked with Indigenous rights, human rights (HR), and place/earth rights.

Post-World War II and as a response to the atrocities committed in Europe, human rights emerged as a critical discourse for framing the rights of individuals and societies. In this time period, delineations regarding rights and international crimes against humanity were drafted through the 1945 London Charter of the International Military Tribunal (Nuremberg Charter), the 1948 Convention on the Prevention and Punishment of the Crime of Genocide, and the Universal Declaration of Human Rights (UDHR) adopted by the United Nations in 1948 (see: <http://www.un.org/es/universal-declaration-human-rights/>). Since its adoption, the UDHR has served to provide one frame for considering rights viewed as universal and incontrovertible, and ideas regarding human rights and their consideration and application have since been expanded. O’Byrne (2013) argued that HR also involved necessarily regarding theories of human nature and the role of the individual, theories of society and the social context of HR violations, theories of ethics and condemnation of HR violations by civil society, theories of politics and the role of the state, and logic of modernity where progress is mythologized and a better world is imagined.

Because this chapter is concerned with not only how HR can be framed by Indigenous peoples but also how HR is taught, the work of Monisha Bajaj is apt. Drawing from Amnesty International’s prepositions that link education and HR, she centralized her inquiry about the expansiveness and potentials of human rights education (HRE) through the lenses of education *about* human rights, education *through* human rights, and education *for* human rights (2011, p. 483, Bajaj’s emphasis). Each of these targets the design, structure, and content of HRE in a way that demonstrates the potential of HR frameworks in practice. In terms of education and according to the 2006 UN World Programme for Human Rights Education, Bajaj highlighted one definition of HRE as “education, training and information aiming at building a universal culture of human rights through the sharing of knowledge, imparting of skills and moulding of attitudes directed to: a) the strengthening of respect for human rights and fundamental freedoms; b) the full development of the human personality and the sense of its dignity; c) the promotion of understanding, tolerance, gender equality and friendship among all nations, indigenous peoples and racial, national, ethnic, religious and linguistic groups,” among others (p. 484). Bajaj pointed out that the UN’s definition of HRE was aimed at seeking commitment from member states and using a top-down approach focused on national policymakers. Drawing from models of HRE produced by international organizations and national efforts in India, she argued that ideological variation was a strength in producing HRE initiatives – that is, not only does the very idea of HRE engender interest, but also the ability of organizations and peoples to use their own worldviews to inform what HRE is and how it can be practiced on the ground are important markers for what HRE can become.

Because of the innovative capacity of Quechua knowledge, ideas and practices regarding HRE can supplement proposals for Quechua education *about*, *through*, and *for* human rights from Quechua worldviews concerned with both local and global issues. Central to any Quechua proposal is connectivity to land – the severing and disruptions of which were addressed in the first and second parts of this chapter. Issuing proposals for Quechua education will include several challenges: First, how

can Quechua communities reframe the language of HR and HRE according to their own principles, values, and desires? Second, how can Indigenous lands and natural resources be reclaimed, revitalized, managed, and protected through Quechua education using principles that first recognize Indigenous ties to land as more than abstract and based in customary international law (Anaya and Williams 2001)? Third, drawing from and transforming discourses of HRE, how can Quechua education frame environmental degradation and climate change and produce educational interventions that combat dominant and public political discourse around progress and projects of development in the Andes region? Last, how can Quechua educational practices and realities speak back or contribute to the discourse of HR and HRE in ways that maintain the integrity of Quechua knowledge while also producing shared knowledge that benefits all life on this earth?

Over the past decade, we have seen prospects for solutions, such as discourse on the rights of Mother Earth that reflect Indigenous ideals of human-environmental relationships and political and social activism. Bolivia's Proposal for a Law of Mother Earth (2010) is a self-described framework that acknowledges people, society, and place in transition through the industrial era and is the result of a critique of neoliberalism and capitalism: "We urgently need alternatives to the capitalist development model that destroys the environment and has caused the financial, energy and food crises, as well as climate change and deep inequalities within and between societies" (p. 5). Aligned with Quechua epistemology that prioritizes balance with the universe, the objectives of this framework were described as "to guarantee the co-existence and preservation of life," which involve a philosophy of humans as a part of nature where Mother Earth is a subject entitled to her own protections – the violations of which are punishable as crimes. Outlining the role of individuals and the role of the state, descriptions of the rights of Mother Earth, along with policy recommendations, were outlined in this document, which has been scrutinized within the Bolivian plurinational state and by critics and supporters of Bolivia's political evolution worldwide. Unclear is how Indigenous peoples and allies will confront structural inequalities that preclude Indigenous participation in these discourses and in setting the agenda for these discussions of power, land, and education.

Conclusion

From our breath to Pachamama, we know how to conserve the land and the waters, which are the blood of Pachamama. We make offerings, as did our ancestors before us. (Mama Ines, personal communication, Cusco, 27 June 2016, author translation)

In this chapter, Quechua knowledge system characteristics have been highlighted in relation to the Andean world and over time, including historical impositions that have resulted in the remaking of the Andean world. Environment and natural resources have been subjected to colonial imposition and overtaking, as well as globalization and climate change, and exogenous and neoliberal projects of development. Newer

examinations and propositions mindful of past resistances and current hopes to transcend resistance towards the creation of new ideas and solutions that honor the past are discussed. As a result of these confluences, *yachayninchis* (Quechua knowledge) and *yuyayninchis* (Quechua social memory) are fluid and require consideration of Indigenous epistemologies, which can also be described as Indigenous wisdom fluencies, lending themselves to transitions on Quechua lands throughout the Andes that Quechua peoples confront. As an exclusive and largely destructive tool of the discourse of progress and the promises of modernity towards socioeconomic betterment, projects of development remain extensions of imperialism and its colonial trajectory. A singular pathway of development undermines Indigenous conceptualizations of human life on this planet, where discourses of progress equal participation in the global capitalistic market focused solely on economic gain and where quality of life is measured through financial indicators and interaction and access to Western technology. Quechua knowledges offer solutions towards repairing this world, and equipped with the language of the past two decades of Indigenous rights, place/earth rights, and human rights education, there is an opportunity to create space for meaningful and productive dialogue that unseats dominant colonial and neoliberal narratives of what humanity is and which pathways we might take in this world.

Abstract

The essay offers reflections on the purpose of Indigenous environmental education. Indigenous peoples engage in wide-ranging approaches to environmental education that are significant aspects of how they exercise self-determination. Yet often such educational practices are just seen as trying to genuinely teach certain historic traditions or scientific skill-sets. Through reviewing the author's experiences and diverse scholarly and practitioner perspectives, the essay discusses how Indigenous environmental education is best when it aims at cultivating qualities of moral responsibilities including trust, consent and accountability within Indigenous communities. The concept of collective continuance is one way of thinking about how moral responsibilities play significant roles in contributing to social resilience. Understanding education in this way can be used to address some of the major issues affecting Indigenous peoples everywhere, including environmental justice, gender justice and the resurgence of traditions.

Introduction

I'm going to share some of my personal reflections on the purpose of Indigenous environmental education from my perspective as a Potawatomi person, relative, scholar, and activist currently living in the Great Lakes region in Turtle Island/North America. This essay is an expression of my perspective and exercise of my rather recent memories and not a research essay. I write from the concern that much is at stake in Indigenous environmental education since so many of our peoples face rampant pollution, food insecurity, biodiversity loss, reckless land and energy development, "natural" disasters, and risky climate change impacts. Brigitte Evering and Dan Longboat claim these environmental issues "disrupt relationships with land" and "community sustainability" (Evering and Longboat 2013, 242), threatening Indigenous health, cultural integrity, political sovereignty, economic vitality, and overall wellness. Some of my reflections will take the form of brief anecdotes from my professional and nonprofessional experiences, though the details will be anonymized since I'm giving opinions on my personal memories instead of aspiring to generalizable knowledge claims from research. The anecdotes are supposed to be illustrative, and I hope they are helpful to the readers. My sense is that people who also work in related contexts will recognize the issues I'm trying to highlight.

I'll begin in this essay with a broad discussion of Indigenous environmentalism and then move on to reflect on education more closely.

Indigenous Environmentalism

Indigenous peoples in North America lead some of the most profound environmental movements in the world. As part of its long engagement in anti-colonial resistance, the Standing Rock Sioux Tribe led a major mass movement to attempt to stop the construction of the Dakota Access pipeline. Diverse Indigenous conservationists, such as Sophia Rabliauskas of the Poplar River First Nation or the late Isidro Baldenegro Lopez of the Tarahumara people, have worked to protect millions of acres of critical forest ecosystems from risks including logging and hydropower. The Village of Kivalina filed a lawsuit in the US against the energy industry, including ExxonMobil Corp., for climate change damages. The Black Mesa Water Coalition has worked for years on environmental justice issues related to water quality, drinking water, and mining in the Navajo and Hopi Nations and has advocated for transitioning to clean, renewable energy. The voices and actions of Indigenous advocates in the Americas have impacted environmental issues globally, including the voices Winona LaDuke, Rodrigo Tot, Ailton Krenak, Gail Small, the late Berta

Caceres, Tarcila Rivera Zea, Sheila Watt-Cloutier, and Tom Goldtooth, among many others.

It's not surprising that Indigenous peoples are compelled to address environmental problems. North American Indigenous peoples often have living intellectual traditions and heritages that center what many people today now refer to as resilience and sustainability. Mayan and Aztec peoples have ancient institutions of astronomy, calendars, and historical record keeping that seek to guide societal preparation to anticipate and respond to seasonal change and interannual trends (Kidwell 2004). Diverse Anishinaabe and Algonquin peoples, among many other North American groups, have long legacies of seasonal round economies, cultures, and political organizations, where societal institutions are designed to best suit the changing dynamics of ecosystems (Benton-Banai 2008; Witgen 2011; Child 2012). Pacific Coast groups, including Nuu-cha-Nulth peoples, have ceremonies such as give-aways (potlatch ceremonies) that motivate nonselfish behavior for the sake of environmental conservation and food security/sovereignty (Trospen 2002; Atleo 2006; Atleo 2002). Yet, in the last five centuries, Indigenous peoples in North America have suffered the advancement of capitalism, industrialization, and colonialism sanctioned by nations like Canada, Mexico, and the US. These forms of domination have rendered many groups vulnerable to new environmental problems caused by military invasion and technology use, extractive industries (including monocrop agriculture and forestry), land and water dispossession and forced geographic displacement, and laws and policies that banned ceremonies and divested Indigenous children of their languages and knowledges. Heather Davis and Zoe Todd call the impact of colonialism, industrialization, and capitalism ecologically "seismic" (Davis and Todd 2017); Larry Gross calls it "apocalyptic" (Gross 2016).

I seek to do what I can to exercise my responsibilities to support Indigenous planning, research, and advocacy on environmental issues. A lot of what I try to do involves collaborating with Indigenous leaders, communities, scholars, scientists, and governments to achieve two outcomes: addressing environmental harms and risks arising at the interface of colonialism, capitalism, and ecological change; strengthening the role of living Indigenous traditions and heritages of sustainability and resilience in guiding and framing our actions. I've worked especially in the Great Lakes on both US and Canada sides, but also, though less intensively, beyond the region. Most people who are involved in similar endeavors can likely attest to the diversity of activities, including development of Tribal planning processes, historical research on environmental traditions and practices, participation in ceremony, support for frontline advocacy, reform of law and policy, and communication through writing, tweeting, Facebooking, and engaging other media. In my job as a professor, I've tried to build awareness of Indigenous intellectual traditions of resilience and sustainability in higher education, Indigenous expectations for good collaboration and allyship in environmental and research initiatives, and Indigenous philosophical contributions to the meaning of environmental justice and food sovereignty.

In my own reflections, I've thought of different ways in which to discuss some of the concepts within the broad and highly diverse orbit of Indigenous intellectual traditions and environmental movements. One concept I've thought a lot about is

collective continuance, which I will tie to Indigenous environmental education at the end of this essay. Collective continuance is the idea that some of the gifts of Indigenous traditions are entire systems of how societies can be organized to be most responsive to different types of change – whether the changes are extreme weather events, intergenerational traumas, seasonal cycles, or military invasions by other societies. Collective continuance is certainly a lot like resilience or sustainability. Yet, Indigenous traditions of collective continuance often focus on how *moral relationships* are significant factors in facilitating how members of a society self-determine their responses to various changes arising from the dynamics of social and ecological systems. Broadly, moral relationships refer to particular types of bonds or affinities. These bonds connect diverse members of a society together, human and nonhuman, through establishing mutual (but not always equal) expectations about how each member ought to treat one another. One of the most important moral relationships in collective continuance is *responsibility*.

Responsibilities can be laden with qualities such as trust, consent, accountability, and reliability. One example of how these qualities work within collective continuance that I'll discuss later is the relationship between Anishinaabe/Neshnabé people and wild rice (Manoomin or Mnomen) that is involved in the seasonal round tradition (I sometimes put the different spellings in English of Ojibwe, Odawa, and Potawatomi languages just to reference *some* of the diversity of accents and English dictionaries.). It's a mutual responsibility in which people and rice are expected do what is in each of their powers to enhance the conditions required for one another to contribute uniquely to the overall wellness of their shared community. The contributions to community wellness are diverse. At one level, they include human and nonhuman nutrition, habitat protection, and safety (such as for fish or birds or for shortages in other food sources). At another level, rice is entangled with stories, educational processes, knowledge keeping practices, giveaway traditions, ceremonial protocols, the vetting of leadership, economic systems, and diplomatic ties that are the fabric of society. So – just focusing on a single slice – someone who is responsible for monitoring rice health must go through an educational process created by their community that can vouch for their trustworthiness as a caretaker; they must also, through ceremonies or giveaways, demonstrate publically their accountability to all their relatives. As knowledge changes over time, the staff of Tribes that use newer scientific instruments to monitor and protect rice, for example, are nonetheless expected to be vetted by elders, work with traditional caretakers, receive guidance from the larger community, and demonstrate their accountability for doing their part to protect the plant's future. Here, what starts as just the idea of humans having responsibility for rice for the sake of nutrition, opens up into an entire universe of qualities of the moral relationship, including trust, accountability, and many more qualities if I were to keep discussing. And I've not even talked about rice's responsibilities to humans – or discussed the many other relationships beyond just rice!

These qualities of the mutual responsibility between humans and rice are, at the same time, aimed at avoiding preventable harms, such as malnutrition or ecological degradation, and promoting the underlying community conditions required for all

beings to pursue their life aspirations, including being able to have meaningful spiritual and cultural lives. Concepts of collective continuance, then, are similar to concepts of resilience or even environmental sustainability because of their emphasis on conservation and adaptive capacity. Yet concepts of collective continuance are unique for their emphasis on looking at moral relationships as a vector through which to examine the interrelationships between human and ecological systems. Studies of collective continuance focus on topics such as knowledge systems that privilege accountability between keepers and learners of knowledge, ceremonies that concretize nonselfish norms, consensus-based decision-making processes that uphold consent, empathetic types of consciousness relating to nonhuman beings (e.g., plants) or entities (e.g., water, ecosystems) as having animacy or agency, respecting diversity in areas such as gender identities and leadership attributes, and protecting the support systems needed for people to engage in civil disobedience when circumstances require it. In this way, collective continuance is about the intensified integration of morality with sustainability and resilience.

The reflection I'll focus on most in this essay concerns the connection between collective continuance and the purpose of Indigenous environmental education, though I won't get to that exact topic until the very end.

Indigenous Environmental Education

Environmental education is a significant topic when I think about Indigenous environmental movements, living intellectual traditions and heritages, and concepts I use a lot, like collective continuance. By "environmental education," I simply mean learning activities that focus on deepening the relationships between humans and nonhuman neighbors and systems, which include plants, animals, fishes, insects, ecosystems and habitats, ecological flows, and entities such as water or air, and the earth system. Environmental education is nothing new for us. Related to what I described earlier, Indigenous peoples have diverse and ancient traditions of how teaching and learning are significant for sustaining critical ecological relationships and supporting resilience in response to seasonal and interannual environmental changes. In many traditions, English words such as "human," "nonhuman" and "more-than-human" are unsatisfying translations that, unfortunately, we have to rely on in many contexts. For many Indigenous peoples see humans and nonhumans as kin or relatives to one another who are bound together through reciprocal responsibilities – akin to family – that support their mutual wellness. Some Indigenous persons identify themselves more with nonhuman ancestors, clans, or other beings than with some special human category. In these ways, Indigenous peoples are often less likely to have some privileged category for "human" that denotes a uniquely rational, wise, knowledgeable, or free being or species.

Indigenous scholars who I read have articulated different reasons for why environmental education is critical for us. Leanne Simpson discusses how "...few communities are equipped with the necessary resources to effectively deal with the over-whelming number of environmental issues facing their people and their lands."

Simpson claims that education provides “knowledge [Indigenous persons] can apply to the situations they face in their communities. . . skills to ensure the cultural survival of their people. . . [and to] become environmental problem solvers within Aboriginal communities, and Aboriginal political or urban organizations” (Simpson 2002, 14). *Land Education*, a recent book edited by Kate McCoy, Eve Tuck, and Marcia McKenzie, features scholars such as Delores Calderon and Megan Bang, among others. Calderon describes how “Land education requires us to consider Indigenous agency and resistance tied to Indigenous cosmologies” and to “destabilize” colonial ideologies that erase Indigenous relationships to their territories (Calderon 2014, 27). Bang et al. discuss, in their work in Chicago, how Indigenous environmental education works to cultivate “longer views of our communities and our homelands not enclosed by colonial timeframes. . .” and seeks to “center Indigenous epistemologies and ontologies by (re)storying our relationships to Chicago as altered, impacted, yet still, always, Indigenous lands...” (Bang et al. 2014, 3). All of these scholars privilege both a sobering, critical account of the current situations of Indigenous peoples and a call for the important and varied roles Indigenous intellectual traditions can play in response to contemporary challenges.

Indigenous peoples are developing and maintaining diverse types of environmental education. In my own orbit, the Tribe I belong to, the Citizen Potawatomi Nation in Oklahoma, and other related Anishinaabe/Neshnabé peoples in the Great Lakes region, have taken great efforts to create and practice educational programs that maintain or revive our traditional relationships to the environment, including relationships to waters, lands, plants, animals, fishes, insects, and ecosystems taken in their entirety (e.g., wetland regions). These environmental educational programs focus on a range of topics, from birch bark canoe building, to wild rice harvesting, to hunting skills, to corn cultivation, to the respectful harvesting of medicines. The *Match-E-Be-Nash-She-Wish* (Gun Lake) Band of Pottawatomi Indians started the *Jijak* Foundation. The foundation revitalized a summer camp in their territory to support educational programs ranging from maple sugar harvesting to Indigenous food sovereignty gatherings. Sylvia Plain created the Great Lakes Canoe Journey, “a project that envisions bringing together the citizens of the Great Lakes Basin. . . to celebrate our relationship to the waterways, to each other, and to learn about Anishinaabe canoe culture and canoe building” (Plain 2017).

In Indigenous environmental education, “program” is not really the right term if we take it to suggest some discreet starting and ending point for learning. For much Indigenous education, in my experience, occurs within family, clan, and other kinship networks over many generations. In my earlier work as part of a project Nick Reo developed on Ojibwe subsistence hunting, we found that education in the ethics, skills, and ceremonies of hunting at the Lac du Flambeau Band of Lake Superior Chippewa Indians occurs across family, clan, and other kinship relationships through each hunter’s lifetime. Learning and teaching never ended. Over the course of their lifetimes, people invested in education to continually learn how to become better relatives to the animals they hunted and to the family and community members they are responsible for sharing harvests with. One hunter expressed how bad it feels to know that humans can’t give their lives to deer – revealing a powerful

aspiration toward reciprocity and a sense that human gratitude for deer is never satisfied (Reo and Whyte 2012). When I was showing Reo what I just wrote here, he also told me briefly a related story. In one of his collaborations on Indigenous water ethics, his partners told him it was awkward to hear him refer to their work together as a “project.” For “project” seemed to fail to acknowledge the ongoing-ness, long-term relationship-building, and personal commitments that really mattered to his collaborators and motivated them to continue on.

At the same time, most Indigenous communities also feature diverse arrays of “programs” in environmental education that work on timelines similar to classes (3 months long, weekly meetings, and so on). I know many friends who are proficient speakers of Ojibwe, Odawa, or Potawatomi accents or who are skilled black ash basket makers because they attended a combination of classes. Though in many cases, these friends took extra time and effort to learn from elders outside of class settings, relying on community and family relationships to make that learning opportunity possible. These friends will continue to become educators themselves in these areas as a part of their lifetime learning.

Indigenous governments and intergovernmental organizations have invested in other types of environmental education that are aimed at supporting Indigenous persons’ advancement in dominant US and Canadian institutions. Tribal colleges and scholarships to nonTribal institutions of higher education often serve to make available training in scientific, legal, policy, and other fields that pertain to careers that address environmental issues. Often graduates of these programs work for their own or other Indigenous governments in departments, offices, or divisions of natural resources and environmental quality. In many cases, Tribal professionals seek guidance from the intellectual and governance traditions of the Tribes they work for (which could be the Tribes they belong to). Jamie Donatuto and Larry Campbell of the Swinomish Tribe, in their roles as staff and Tribal members, have drawn on the Tribe’s culture and traditions to understand and educate about community environmental health (Donatuto 2008; Donatuto 2016). Or the College of Menominee Nation developed its Sustainable Development Institute in 1993. The institute came out of the commitment that sustainability has always been part of Menominee life, including “respect for the land, water, and air; partnership with other creatures of earth; and a way of living and working that achieves a balance between use and replenishment of all resources” (Morris 2017).

Indigenous environmental education importantly includes the traditions of collective action that work to achieve social, political, and cultural transformation. Indigenous mobilization to protect water is an example, including the multiple treaty initiatives such as Treaty Rights at Risk (Tribes of Western Washington), the Mother Earth Water Walk, and the NoDAPL (Dakota Access Pipeline) movement (Dhillon and Estes 2016; Treaty Indian Tribes in Western Washington 2011; McGregor 2005). Participants in these mobilizations often don’t use “activism” or “protest” to describe what they are doing; rather, they describe themselves as water protectors, water walkers, relatives of water, among other identities and kinship relationships tied to reciprocal responsibilities. They often describe their actions as ceremonies. Melanie Yazzie’s work speaks to Indigenous environmental justice activism pertaining to

water as the “social life of water,” which expresses and enacts a “radical politics of relationality” (Kearns 2017). In the NoDAPL efforts, many Indigenous persons, both from the Standing Rock Sioux Tribe and others, designed camps, performed ceremonies, and engaged in diverse protocols that are uniquely Indigenous traditions of collective action. Indigenous organizations and peoples have longstanding traditions of education in how people can learn to orchestrate and participate in collective action *as* ceremony and protocol and observe norms about who (human or non-human) has responsibilities to communicate (e.g., speak), listen, advise, and represent.

Though I’m not trained, either through Indigenous, US, or other institutions, as an education scholar or specialist, I’ve endeavored to work in Indigenous environmental education as best I can. So in this essay I can share experiences, but I don’t have the depth in the educational literature that a scholar trained in the field would, and hence I can’t cite widely from educational scholarship. I’ve codesigned with dynamic colleagues experiences such as the Indigenous Planning Summer Institute at the College of Menominee Nation Sustainable Development Institute, the Tribal Climate Camp with the Affiliated Tribes of Northwest Indians (hosted by a different Tribe each year), and numerous climate change planning workshops for Tribes in the Great Lakes. I’ve also trained many hundreds of scientists in Indigenous approaches to collaboration with Tribes on environmental issues. In my practices as an educator, I’ve engaged traditional education as pertains to climate change, Tribal climate change planning, and the advancement of Indigenous pedagogy in the sciences for promoting ethical intercultural collaboration (though these labels for typecasting Indigenous education are provisional given they can imply false demarcations across highly integrated approaches to educational practices).

In my personal experiences witnessing, being a student in, or organizing Indigenous environmental education, I’ve come to wonder about what purposes Indigenous environmental education serves.

Indigenous Climate Change Planning

I engage with Indigenous environmental education most often through climate change planning with a number of Tribes in the Great Lakes region. In one part of my work in this area, a collaborator, Mike Dockry, and I, discussed the idea of trying to Indigenize futures planning through facilitating Tribal scenario development on how best to prepare for climate change. We expanded this work with collaborators Chris Caldwell and Marie Schaefer in projects organized by the Sustainable Development Institute at the College of Menominee Nation. Scenario planning involves people imagining plausible and possible futures tied to certain issues they are concerned about, both as individuals and as members of self-governing communities and nations. Scenarios express visions of the future that suggest ideas for how people living today can prepare themselves for the sake of maintaining their capacity to honor their ancestors and support the wellness of their own and future generations. Scenario planning is as much an educational process as it’s about planning and

governance. People can see scenario planning as a way to raise greater awareness of and increase the practice of the community's own traditional ways of talking about the climate, such as their seasonal round system. Fulfilling this goal involves creating opportunities for bringing different knowledge keepers and learners together at appropriate times and places. People also often want to learn what others, outside of the Tribe, are saying or know about climate change, especially other Indigenous peoples, as both a global phenomenon and a local issue. So scenario planning often involves inviting educators and creating opportunities to learn from the experiences and tools of other Indigenous peoples, universities and non-profits, inter-Tribal organizations, and US or Canadian national or state/provincial agencies. Sometimes people who are members of or work for a particular Tribe may feel like they don't have a venue for sharing their knowledge about climate change or may not see how they can take leadership in climate preparedness that pertains to their duties as members/citizens or employees. In the planning institutes I'm part of that I referenced earlier, a lot of what we discuss collaboratively are the best ways that scenario planning can be used to energize community events, persuade Tribal council, and energize people of all generations to address climate change.

In scenario planning, climate change is a highly integrated topic. Climate change issues, from increasingly severe droughts to warming waters, are at once issues of politics and economics (e.g., treaty rights), health (e.g., dietary changes), culture (maintenance of traditions), and environmental management (e.g., choices about what species to conserve and restore), among many more dimensions. So scenario planning requires addressing all these dimensions together. Yet in the educational work required for scenario planning, what I often find is a central challenge: Tribal staff are really separated from each other, even in rather small communities or nations. So the educational aspect of scenario planning often becomes an exercise in empowering relationships – which goes beyond simply providing information about climate change or providing opportunities to express visions of the future that can persuade Tribal leadership. It's not uncommon, for example, that in different Tribes there are no working relationships across people specializing in areas such as language maintenance/revitalization, health, and environmental management. Each of these areas are divided up into departments or offices that are "silo'd" or "stove-piped" off from each other, so to speak. Working in these offices involves devoting time to meeting specific objectives that are the ones designed by the US government or Tribal program that supports and funds the office. These objectives are often associated with very pressing Tribal needs, such as recording an elderly fluent speaker or addressing diabetes prevention.

At the same time, I find people in each line of work will cite problems due to a lack of integration once we start talking about organizing educational activities for scenario planning. People in Tribal environmental offices sometimes are concerned that they don't get enough community engagement in their work because there is little linguistic, storytelling, or cultural content to public events or meetings or internships they put on; language teachers sometimes say it's hard to teach language without access to the lands, waters, and environmental skillsets that inspired the language in the first place. Or I know of situations where Tribal health professionals

and Tribal environmental professionals rarely collaborate, which is ironic given the connections between environmental quality, diet and exercise, and health outcomes, as the body of work of Alice Tarbell and Mary Arquette demonstrates directly (Tarbell and Arquette 2000). I think the mutual solutions are rather clear in theory. The problem, of course, is that US federally recognized Tribes have come to operate using organizational structures heavily influenced by US and Western political traditions, which divvy up issues like health, culture, food, and the environment to separate sectors or departments – reducing them to being matters of “resources,” “rights” or “jobs.” These traditions are quite different from the organizational traditions derived from Indigenous calendars or seasonal rounds where government integrated together the issues with clear connections, such as language, health, economics, spirituality, politics, and the environment. In these contexts, the scenario planning process is often about how to reestablish integration and find ways to restore qualities of accountability, inclusivity, and reciprocity across people and offices that are unnecessarily kept separate. So the key outcome of the educational part of scenario planning often turns out to be the effort to engender greater qualities, such as accountability, across stove-piped offices that make it possible to address climate change in an integrated fashion. This outcome may seem very far removed from climate change preparedness. But is it that far removed (a rhetorical question)?

The importance of qualities of reciprocity, inclusivity, and accountability are part of other aspects of the educational process in scenario planning. I remember one scenario process in particular as illustrating this point. It was a scenario visioning workshop involving many people involved in subsistence/sustenance hunting and fishing. In this case, many Tribal members who attended placed a lot of emphasis on US recognized treaty rights as protecting their responsibilities to support their families and communities through harvesting relationships with different plants and animals. My collaborators and I thought we had come up with a really good scenario idea to discuss with the attendees: What if 50 years from now the US negates all treaty rights? Given climate change impacts on animal and fish habitats, what would this scenario be like? What would the Tribe do? After we posed the scenario, no one really looked very surprised. Then, someone finally chimed in and said that the Tribe would probably be fine because everyone would just go back to “poaching.” For readers not familiar with this context, “poaching” doesn’t really refer to illegal harvesting as a solution to climate change. Rather, it turned out that in the many years before the Tribe had relitigated their treaty with the US, people engaged in secretive harvesting. This harvesting was made possible thanks to dense moral relationships with qualities like reciprocity, accountability, and inclusivity across different families and communities.

In a not so far-off era when it was “illegal” to be Indian and exercise treaty rights, these qualities of moral relationships allowed many people to collectively monitor environmental change to stay on top of harvesting trends, train young people, and maintain an orderly network of communication so that harvesters could share with those who needed food the most. The relationships needed for “poaching” are very much ones that could be useful for addressing climate change, and US recognized treaty rights were not, at the time, necessary for people to have and maintain these

relationships. Some participants thought that the legal and bureaucratic aspects of US recognized treaty rights have actually led some people to disengage from or forget about the importance of these qualities of moral relationships. The participants then suggested that the scenario planning and educational process should be about recognizing and reempowering these family/community qualities for improving people's knowledge of environmental change (and hence responsiveness to climate change) and creating a sense of environmental stewardship in young people. Again, this scenario workshop seemed to go far afield from the topic of imagining climate change futures. But that's just one way of looking it, as I would argue that the workshop actually got far closer to the heart of climate change than perhaps what was originally intended when we posed the abnegation of treaty rights as a scenario.

In this work on Tribal climate change planning, it has seemed to be that the purpose of Indigenous environmental education is really about empowering qualities of moral relationships.

Indigenous Traditional Environmental Education

Tribal traditions in the Great Lakes related to wild rice, sturgeon, bees, and deer are the types of curricular topics many Tribal members are interested in working on, especially as they are connected to Indigenous languages. For these species' life cycles and peoples' linguistic expressions for them are connected considerably to seasonal and interannual environmental changes. At the same time, the distinctness of traditions is central to many Indigenous peoples' identities in the Great Lakes region and tied to treaty rights, cultural and moral responsibilities, and nutrition and exercise. Plants like wild rice or fish like sturgeon, for example, are charismatic for many Native persons, which make them ideal for attracting people to invest their time to participate and learn about a range of topics, from language to climate change. I've also witnessed or participated in many different traditional educational programs related to environmental skill-building through visiting many different Tribes as part of my climate change and conservation work as well as my everyday desires as a Tribal member wanting to learn more about our history and culture.

In my experience, I see a lot of "traditional" environmental education programs that attempt to faithfully or genuinely maintain or revive traditions. Yet often my experiences are punctuated by my having extremely critical and negative reactions to the ways in which some traditional education activities are designed and implemented. Gender is one of the examples that concerns me most. I've seen in some cases traditional educational activities that privilege male leadership, men's knowledge, and masculine perspectives on the significance of certain traditions and their histories. I have been told that these male roles are unquestionably part of Tribal heritage dating to time immemorial. Often, however, I found through research or talking in depth with elders that such interpretations of history were largely inaccurate or based on hasty reconstructive analyses of the already problematic work of nonIndigenous anthropologists. These experiences remind me of Jennifer Denetdale's body of research on situations in the Navajo Nation. In these situations,

she challenges the cogency and accuracy of how “tradition” is used to justify marriage inequality, the exclusion of women from leadership, and other moral issues (Denetdale 2006, 2009).

At times, when I’ve discussed matters of differing historical interpretation, I was told that even if my view was correct, there was still another reason to organize traditional education this way. I was told that it was important to accommodate what I might call here “hyper or overly-emphasized masculinity” in traditional environmental education to reinvigorate men’s sense of having relevant roles in their societies, given the oppression Indigenous men have faced. One example I hear a lot is that historically hunters had to have aggression to effectively carry out that responsibility, so masculine aggression should be accommodated as an outlet for Indigenous men today. Yet, in my interactions with multiple harvesting communities, I don’t find male hunters, for example, as needing to invest in a hyper or toxic masculinity or patriarchal mindset or to see aggression as a necessary ingredient for success. In fact, relational qualities – including community accountability and empathy – seemed more to motivate successful hunting, leaving men and boys who are susceptible to adopting patriarchy with many viable alternatives. The alternatives arise from both Indigenous traditions of community-based reciprocal responsibilities but also from practices modeled by men today who practice ethical, liberatory gender identities and norms.

Many Indigenous peoples also see their traditions as involving nonbinary gender systems. In historical work and my discussions with many Anishinaabe/Neshnabé persons, it’s the case that persons of diverse genders and ages have long traditions of hunting too, whether performing the actual harvesting or participating collectively in all the activities associated with hunting (e.g., butchering, cleaning, etc.) (See Norrgard 2014; Buffalohead 1983; Child 2012; Sinclair 2016). Even in cases of a few Tribes I know where some members are convinced that something sounding like patriarchy (not just patrilineality) is accurately part of their history, I’m not sure why its maintenance and the normalization of exclusion are morally acceptable aspirations. I couldn’t help thinking that there must be a way to maintain and valorize our traditions and ceremonies through education without sanctioning privilege and exclusion. Historically, Indigenous traditions seem to be more about building and maintaining interpersonal trust, high standards of consent, and respect for diversity. In my mind, such cohesion makes it more possible to discuss and address patriarchal and other forms of domination that affect everyone, albeit differently – such as how Indigenous girls and boys are trafficked sexually in areas with extractive industries (e.g., the Bakken) (Deer and Nagle 2017) or the state-sanctioned violence that Indigenous persons experience distinctively in relation to their gender, such as murder, going missing, domestic abuse, police assault, and exploitation.

I’ve contrasted some of the problems I saw in some cases with traditional education I felt particularly appreciative of. I saw educational programs teaching traditions and ceremonies that claimed that the traditions embraced inclusiveness, trust, consent, empathy, and diversity. I have discussed with collaborator and friend Deborah McGregor how in some of the Great Lakes water walks inspired by the Mother Earth Water Walk, for example, the walkers valorized certain conceptions of

Anishinaabe women's responsibilities to water; at the same time, the walkers were open to all interpretations of environmental responsibilities inclusive of all genders. In my recent work with Sherry Copenace, we have discussed how she teaches coming of age ceremonies in Winnipeg, Manitoba and Kenora, Ontario that allow persons to choose whether to participate in ones oriented toward boys or girls. Someone can choose to do both too (Copenace 2017a). So, for example, learning to be "Anishinaabe" in one's environmental relationships meant learning about a morality that didn't sanction exclusion and privilege, even in cases where some of the teachings may have an initial binary gender orientation for various reasons. Some friends and scholars also point out that these initial binary gender orientations in some traditions are more reflective of a failure of translation from Anishinaabe language and culture to English language and US and Canadian settler culture. Margaret Noodin writes that "Anishinaabe language and culture acknowledge gender difference, but in a way that relies on choice and context rather than fixed and predictable rules" (Noodin 2014, 12). My experiences, and Noodin's sentence quoted here, suggest an important morality that needs to be the focus of traditional environmental education.

In the examples I have given, it's qualities like trust or accountability that are most important as a way of learning about relationships to nonhumans, such as water in the Mother Earth Water Walk. I have followed Tribal sturgeon restoration in the Great Lakes region for some time now. I find many restoration projects to be very powerful expressions of Indigenous traditions. Sturgeon, who have ancient relationships with many Tribes, have been greatly harmed by US and Canadian settlement, from overfishing to dams. But the purpose of Tribal sturgeon restoration is rarely, in my opinion, just about making it possible to add sturgeon back to our regular diets or to be able to practice certain sturgeon ceremonies or customs exactly as our ancestors did. The Little River Band or Ottawa Indians and the Menominee Nation created public ceremonies and community feasts to commemorate the centrality of sturgeon in certain moral relationships. Sturgeon is a trusted and reliable *relative* of people, often called a "grandparent" owing partly to the fish's wisdom and long life. That sturgeon would, as Jay Sam says, "sacrifice" itself for humans, should motivate humans to become aware of how they can be trustworthy and accountable environmental stewards so that sturgeon (an anadromous) fish will return each year (Holtgren et al. 2014). Little River's sturgeon-release ceremony invites the public to attend when juvenile sturgeon are released into the river each fall, exposing many non-Natives to Indigenous histories, culture, and traditional knowledge of sturgeon, as well as sturgeon biology and life cycles and environmental challenges. The Menominee sturgeon feast each spring is also public, bringing Menominee and non-Menominee together for educational and cultural immersion in sturgeon-related history, values, and practices, including dance.

When I talk to Odawa and Menominee attendees, some tell me that they see the ceremony and feasts, which attract hundreds of people, as a chance to commemorate accountability to the fish, to create intercultural conversations about sturgeon science, to heal relationships with settlers through a public discussion of environmental degradation, and to engender responsibilities in future generations. At the Odawa

ceremony, many children of all heritages personally release a juvenile sturgeon into the river. The ceremonies and feasts bring people together to strengthen moral qualities, in this case accountability, but also trust, consent, and reciprocity. They seek to not only rebuild the social fabric of Indigenous peoples, but also to repair the conflicting relationships with settler and other non-Indigenous populations in the region. Winona LaDuke, writing on the restoration of sturgeon at White Earth, has expressed hope that “Maybe the fish will help a diverse set of people work together to make something right. . . . The fish help us remember all of those relations, and in their own way, help us recover ourselves” (LaDuke 1999). To me, in sturgeon restoration, Indigenous environmental education is not really about *the* human and *the* fish; rather, it is about invigorating in today’s times and for the future moral relationships through which all beings respect one another based on their interlocking responsibilities and their unique contributions and agencies (Whyte 2018).

Here, again, this time with Indigenous traditional environmental education, it seems the purpose has to do with empowering qualities of our mutual responsibilities to one another.

Collective Continuance

In my experiences with education, when I contrasted examples that I appreciated with ones I was uncomfortable with, I began forming conclusions that the difference involved the presence or absence of certain qualities of our mutual responsibilities to other humans, nonhumans, and the environment. Qualities here refer to properties of relationships that make it possible for the discharge of the contributions associated with the relationships to have wide societal and environmental impacts - whether impacts are understood as outcomes (e.g. clean water) or protection of ethical norms (e.g. self-determination). So, for example, the responsibility (i.e. the particular type of relationship) to teach others how to harvest appropriately (a responsibility both to other humans and to plants and animals) will have an important impact if teachers are trustworthy, if they are inclusive of difference and refrain from exclusionary practices, if students can consent to their own learning by being able to ask questions and engage in dialogue, and if learning involves practices that build a sense of community accountability among diverse humans and nonhumans – among other examples of qualities. When I thought more about our traditions, I realized that their importance is not that they are “ancient” or “the way it’s always been.” Rather, they are stories or guides for understanding the moral fabric of our peoples that is woven with these qualities of trust, empathy, consent, and many others. Consider a tradition like wild ricing, now in more detail.

Many Anishinaabe/Neshnabé peoples have spiritual connections to wild ricing going back to their origin stories that involve a migration in which a white shell instructed them to stop at the place where food grows on water. Education about wild ricing can be about learning the exact techniques for monitoring rice beds, harvesting rice, parching, organizing ceremonies that feature wild rice in different ways, and so on. At another level, wild rice traditions involve much more. They are about how to

design and organize societal institutions to be consensual, accountable, reciprocal, trustworthy, empathic, and respectful of secrecy (what I call diplomacy). Wild rice is not actually important just because of its historic connection to Anishinaabe people. If we look more closely at different practices of wild ricing, historically and across different communities today, we see that over time ricing facilitated critical qualities of responsibilities.

One quality is trust. Community members trusted the persons and clans vested with authority and knowledge. Consent is another quality. Anishinaabe ricing involves the opportunity to consent to the leadership through ceremonial and vetting processes that people had to pass through to be acknowledged as leaders or experts. These leaders or experts were accountable to the communities. Trust and consent worked to solidify gender equality and fluidity. Resilience (or redundancy) is another quality. Ricing developed as a highly redundant practice as people are motivated to monitor many rice lakes, making ricing resilient in cases of environmental change. The harvesting camps and protocols facilitate the creation of many knowers of rice habitats, not just a few people who end up being overtaxed with working on behalf of entire communities. Diplomacy is another quality, where it refers to the desire to engage with people without divulging secrets. Families, clans, and Tribal groups formed close relationships to avoid trespass but also to ensure restorative justice occurred when someone wrongfully or accidentally used the rice bed that another family depended on. Societies with high degrees of trust, consent, diplomacy, and redundancy, among many other qualities, have the moral fabric to work together in good times and bad times and the relationships across humans and nonhumans that support the developing and maintenance of important environmental knowledge. For at least these reasons, I would speculate that societies with high degrees of these qualities of responsibilities can best respond to environmental and social changes.

A range of scholars point out that there was a period in early twentieth century history in which Ojibwe men began to participate more in wild ricing, berry harvesting, and other activities that previously were led by women. Evidence indicates that this gender shift occurred as the plant was commodified for sale to nonnative consumers and access to land dwindled due to US colonialism (Vennum 1988; Norrgard 2014; Child 2012). Critically, there are at least two interpretations of this type of change. The first interpretation is that this may have been an instance of undermining women's leadership, respect, and expertise, which is a historic and ongoing violence of US colonialism. The US deliberately undermined women's roles as diplomats and knowledge holders (Sleeper-Smith 2005). A second interpretation, which also bears out in some accounts of the transition, is that the ancestors who made these decisions perhaps felt strongly that gender roles could shift fluidly at different times because trust and consent flourished to a sufficient degree. So the shifts wouldn't have facilitated, at least at that time, the emergence of patriarchy. While, depending on the particular community or time period, this interpretation could simply not be true, I invoke it here to illustrate the importance of how a society – in the case that strong moral relationships and qualities of responsibilities are maintained in the face of adversity – can allow certain shifts in traditions to occur ethically for the sake of protecting the wellness of future generations. If the shift

worked in this way, it would keep open the possibility that women would be able to return to the involvement with rice that they once had and be acknowledged for their continued leadership in ricing, often behind the scenes, while under great duress and hardship.

My analysis here is not just backward looking. Indeed, it's the moral relationships with rice that have supported Anishinaabe leadership in responding to pressing environmental issues in the Great Lakes, including mining, commercial agriculture and genetic modification of plants, irresponsible recreational activities, oil and gas pipelines, and fracking. The Chippewa Tribe of Minnesota, with sponsoring partners such as the University of Minnesota, hosts a biannual conference called the *Nibi & Manoomin Symposium* that works to educate non-Indigenous persons, the state, academic institutions, and corporations about the moral qualities of wild rice. Last year's conference was titled "Accountable Relationships." The work of the Indigenous Environmental Network, the Great Lakes Indian Fish and Wildlife Commission, the Mother Earth Water Walk, Honor the Earth, and many Tribal governments have stood up against threats to water quality and wild rice habitats in the name of the moral relationships bound up with water and rice. The current Indigenous resistance to the Enbridge Line 3 pipeline is an example of how the significance of moral relationships today supports direct action against environmental hazards. While today Tribes use new types of science and new governance instruments (e.g., US treaties, state laws, federal programs, Tribal economic revenues) to protect rice and the environment, it is again those ancient qualities of responsibilities to wild rice that continue to motivate these major conservation and environmental justice endeavors.

When I reflect on wild rice and many other examples, like sturgeon or "poaching," I get the sense that the fabric of our societies are woven of qualities of responsibilities that protect our potential to live good lives, allow us the options to change without compromising trust and consent, and motivate us to resist domination. Sherry Copenace has discussed with me how *bimaadiziwin*, or the good life, really refers to the capacity of a society or Tribal nation to do the best within the circumstances its members happen to be facing (Copenace 2017b). I have tried to approximate this way of thinking in my reflections on *collective continuance*, which I discussed at the beginning. Again, collective continuance is the idea that certain qualities of moral relationships, like consent or trust, are crucial for supporting our societies' capacities to respond and adapt to changes we face. When we think of our traditions, each of these clans, committees, decision-making processes, ceremonies, and so on ensured that people trusted those vested with authority, consented to leadership, protected valuable knowledge, and promoted inclusivity and diversity. Traditions are not techniques only in the sense of a skill or even a hobby. They are moral relationships that guide how society is organized socially, culturally, politically, and ecologically. The moral relationships are valuable historically for at least two reasons when thinking more specifically about human interactions with the environment. First, they represented systems that were attuned to, and had reciprocal feedback loops, for particular types of ecosystems. Second, they also facilitated adaptation to more extreme changes, such as US colonialism, making it possible for

many Native people to have survived some of the worst domination any group of people can endure. Both reasons can be actualized today too and into the future, though the forms and practices are and will be different. An entire legacy of philosophy and practice that connects moral relationships to institutional orders is perhaps one of the greatest gifts our ancestors gave us. They gifted us an entire intellectual tradition unfolding over many hundreds of years, where we can study and discuss how moral relationships with qualities of accountability, trust, consent, reciprocity, respectful diplomacy, and many others are built into our societies' political organizations, cultures, religions, social norms, and economies.

Education for Collective Continuance

Anishinaabe studies scholars often write about many examples of what I am calling collective continuance, including concepts of transmotion, migration, seasonality, and transformation. I interpret this in the diverse work by Brenda Child, Gerald Vizenor, Heidi Stark, Niigaan Sinclair, Scott Lyons, Deborah McGregor, John Borrows, Megan Bang, Kim Blaeser, Mike Dockry, Robin Kimmerer, among many others. I read a lot of this work as showing, in varied ways, how it's qualities of mutual responsibilities that ought to be the focus of what we do as Anishinaabe peoples today. Education, say, on how to harvest and distribute wild rice, should be just as much about the techniques as it's about, say, how to organize a wild rice committee that is trustworthy, inclusive, mutually accountable, and consensual. Reading a recent introduction by Joanne Barker to the book she edited, *Critically Sovereign*, she quotes Leanne Simpson to make important connections between "ethical values" and how we interpret traditional teaching or education. In *Dancing on Our Turtle's Back*, Simpson challenges static concepts of traditions based on "rigidity and fundamentalism," arguing instead for the importance of "self-actualization, the suspension of judgement, fluidity, emergence, careful deliberation, and an embodied respect for diversity" (Barker 2017, 25; Simpson 2011, 25). For me, reading this, I see these moral relationships as ones that can create better learning environments that support philosophies of ethical and just institutional design and philosophies that motivate direct action to address forms of domination that can tear our peoples part, including patriarchy, economic exploitation, and the US and Canadian desires to erase our cultures, histories, diversity, and political self-determination.

Indigenous studies scholars have widely identified moral relationships as significant for guiding how Indigenous peoples respond to power and domination. Sarah Deer shows how the renewal of traditional restorative justice as a response to sexual violence in Indigenous communities must protect against the tendency for Indigenous men to internalize settler hetero-patriarchal values that distance them from being accountable to their communities (Deer 2009). Mishuana Goeman discusses how diverse Indigenous persons appealed to their ethics of community accountability, even outside of their traditional forms, when they reorganized themselves in urban centers in response to the US twentieth century Indian relocation policy

(Goeman 2009). Dian Million supports the quality of inclusivity as a significant ethic of Indigenous women's social justice work and activism (Million 2013). Megan Bang's work on science education shows how it's precisely reciprocal responsibilities rich in moral qualities between human and nonhuman worlds that are missing in STEM education for children (Bang 2018). Each of these scholars offers qualities of responsibilities – including accountability, consent, trust, reciprocal responsibly, and others – as guiding solutions for the continuance of our diverse peoples, at the same time they trenchantly critique sexism, racism, classism, and other forms of domination.

For my own referential purposes, I think of this orbit of thought as offering diverse concepts of collective continuance. Concepts of collective continuance highlight how particular qualities of moral relationships are valuable to us for how they are organized systematically to support the capacity of our peoples to respond effectively to changes that we can't control. Adaptive capacity, of course, is *not* – at least to me – about turning the other cheek to the on-the-ground violence imposed by systems of structural domination, such as settler colonialism. The adaptive capacity of collective continuance does not require us to sacrifice the importance of anti-violent activism, public ceremony, and radical critique of settler colonial domination for the sake of institution building or the need to make internal reforms within our communities. For example, I heard widely from different persons how the *Mni Wiconi* (*water is life*) philosophy expressed by Standing Rock Tribal members and embraced by Indigenous peoples globally has a number of values. It honors Lakota and Dakota traditions of ethical relationships with water *as a relative*, motivates radical resistance to extractive industries, and recommends alternative designs for institution building that protect genuine consent, build trustworthiness, and embrace gender equality and fluidity. While the philosophy articulates these goals, *Mni Wiconi* is importantly about environmental sustainability, resilience, and conservation too (see Dhillon and Estes 2016 for many of the views I have heard).

In Indigenous studies, I read much scholarship as enriching our understanding of morality and continuance: “Survivance” (Gerald Vizenor), “*naw'qinwixw*” (Jeanette Armstrong), “muskrat theories” (Megan Bang), “fish pluralities” (Zoe Todd), “Native feminism's spatial practice” (Mishuana Goeman), “grounded normativity” (Glen Coulthard), “land education” (Eve Tuck, Marcia McKenzie, Kate McCoy), “radical politics of relationality” (Melanie Yazzie), “resurgence” (Leanne Simpson), “polity of the Indigenous” (Joanne Barker), “Indigenous legal orders” (John Borrows and Val Napoleon), “an open sense of place” (Soren Larsen and Jay Johnson), and many others too numerous to cite here (Vizenor 2008; Armstrong 2007; Bang et al. 2014; Todd 2014; Goeman 2009; Coulthard 2014; Tuck et al. 2014; Kearns 2017; Simpson 2016; Barker 2017; Napoleon 2013; Borrows 2002; Larsen and Johnson 2012). While I tend to interpret these forms of scholarship as concepts of collective continuance, their contributions arise from their own intellectual and community orbits beyond what I can discuss or further analyze here. Indigenous environmental education *for* collective continuance refers to education designed to immerse us in our traditions of qualities *of moral relationships across generations*. From trustworthiness to inclusivity, these moral relationships are critical to the

flourishing of our societies in the face of conditions of constant domination. The moral relationships that make up collective continuance support our capacity to grow connections to particular places *and* to adjust ethically and critically when our lives migrate to different places or when we encounter less familiar circumstances. Concepts of collective continuance honor our histories and the resurgence of our traditions. At the same time, these concepts support what is – on my view – perhaps the best tradition of Anishinaabe and other Indigenous peoples: critical reflection and thoughtfully designed institution building. The collective continuance of our peoples must involve the coordination of a diverse range of actions, including radical activism and the politics of refusal (Simpson 2014) against settler colonialism, but also Indigenous planning, diplomacy, internal reform of our governments and self-criticism.

For Indigenous environmental education, then, one purpose is learning – in diverse, inclusive and generationally appropriate ways – about how to maintain and transform moral relationships within and across our peoples for the sake of our collective continuance. Indigenous environmental education must be at the forefront of pedagogy that makes crucial connections across moral qualities and environmental issues that matter to our peoples. It must be able to connect concepts and issues together, *such as* consent, patriarchy, *water is life* and environmental justice, *or* community accountability and trust, gender politics, hunting, and treaty rights – among many more necessary connections.

homes. While forms of everyday resistance and resurgence are enacted by Indigenous families and communities, systems of education for Indigenous children and youth often remain sites of trauma, assault, and aims of Indigenous erasures. Much work has been done by Indigenous scholars and allies to challenge hegemonic and settler colonial agendas in education and to assert Indigenous families and communities as changemakers reshaping education toward thriving Indigenous futures. This chapter synthesizes across literature on Indigenous family engagement to argue for (1) the need for continued assertions of Indigenous families' and communities' ways of knowing and being; (2) engaging Indigenous families and communities as dreamers, nation-builders, and future elders; and (3) engaging promising strategies for reimagining and cultivating family-community-school relationships.

Introduction

Families are the heart of Indigenous nations and communities. For many Indigenous people and communities, families include all of our relations – reflecting multiple generations, extended family, other community members, more-than-humans, and the lands and waters of our homes. Indigenous familial relationships have a wide geography and reflect Indigenous knowledge systems as they unfold in everydayness (Cornthassel and Scow 2017). Families are the archetype for Indigenous nations and often reflect a complex web of interdependence between all things. Families are the primary contexts in which Indigenous children learn who they are, Indigenous ways of knowing, and what is expected of them as they become adults and eventually become good elders. In this way, the strength and well-being of Indigenous families are fundamental to the strength and well-being of Indigenous nations. Given this perspective, we suggest the everydayness of Indigenous families' lives is perhaps the sites in which the most radical and hopeful possibilities for Indigenous resurgence and futures can and do unfold (Simpson 2011; Cornthassel and Scow 2017).

While the centrality of Indigenous families to Indigenous nationhood may seem straightforward enough, it also is the reason that settler-colonial nation-states have routinely created and enacted policies across generations intended to dismantle, disrupt, or assimilate Indigenous peoples through forced changes in familial structures and relations (e.g., Muir and Bohr 2014; Sarche and Whitesell 2012). Although the well-known insidious strategies like forced attendance to boarding schools have subsided, policies intended to intervene in and reshape familial relationships continue to be widespread. Examples include compulsory attendance laws, high rates of foster care, legal guardianship instead of kinship, and age segregation in classrooms, among others. Additionally, forced removal from traditional homelands, policies that

restrict access to land and water to engage in traditional harvesting and hunting practices, or legislation preventing Indigenous spiritual practices have intended to sever human relationships with land, waters, and more-than-humans – relations central to Indigenous families. These impacts on movement and activity are further entrenched by the curricular aims of much of schooling. Mainstream curriculum and pedagogy contributes to and perpetuates settler-colonial narratives of Indigenous erasure, conquest, and dispossession (e.g., Calderon 2014; Grande 2004; Shear et al. 2015; Tuck and Gaztambide-Fernández 2013).

Evolving from this history, Indigenous family engagement and leadership in schools is again a focus in policy and practice wherein family engagement in schools is being mandated, measured, and resourced to reflect particular stances and goals. While this is true across the globe to a great extent, in this piece we will primarily focus on dynamics connected to the United States in which family engagement paradigms largely remain a one-size-fits-all assimilative demand modeled after White, middle-class forms of engagement and practices. However, there has been a swell of research on Indigenous family engagement from Indigenous peoples across the earth that can provide important resistance to and redirection of dominant family engagement strategies that perpetuate settler-colonial aims and histories. Our goal in this piece is to articulate a framework – rooted in a critical review of the literature – for Indigenous family leadership in systems of education that cultivate cultural and intellectual vibrancy and contribute to Indigenous collective well-being. As Indigenous and mixed-race mothers of children in US schools, former classroom educators in pre K-12 settings, and as scholars of education, we [authors] recognize that our histories and experiences shape our analysis of the literature and our hopes and dreams for our family and community well-being and the kinds of roles we might play in family leadership and educational transformation. A challenge for us is always to both dream and contribute to birthing resurgences and Indigenous futures – an elsewhere to the current settler-colonial forms and systems of education – as well as to account for the here-and-now enclosures. It is our hope that the stories, analyses, and recommendations here resonate with Indigenous families globally and contribute to heterogeneous and locally nuanced forms of family leadership and engagement that contribute to Indigenous well-being and educational justice.

We begin our review by situating mainstream family engagement as a research-policy-practice field within a broader settler-colonial agenda. Here we unpack mainstream constructions of family engagement and how it impacts Indigenous families today. Secondly, we explicate several dimensions of enclosure that Indigenous families face when attempting to transform schools and systems. This section is divided into three main findings: (1) racism, invisibility, and exclusion of Indigenous families in school, (2) tokenism and inclusion toward Whiteness in transactional family engagement paradigms, and (3) inauthentic decision-making processes based on onboarding to school agendas and fostering compliance. By explicitly naming these enclosures, we hope to highlight the difference between assimilative forms of family engagement and the promising forms of Indigenous resurgence enacted by families in the everyday. In the third section, we explicitly focus on promising practices and everyday resurgence in families and beyond. In this section

we highlight four main facets of family engagement that contribute to Indigenous resurgence: (1) learning from and with our lands, waters, and more-than-humans is integral to Indigenous family engagement, (2) multigenerational and lifelong learning are integral to Indigenous education and therefore foundational for Indigenous family engagement, (3) relationships and collaboration with non-Indigenous educators and systems need new forms of partnership that recognize and cultivate everyday Indigenous resurgence; and (4) equitable and transformative collaboration with families leads to rigorous academics and higher achievement for Indigenous students. Broadly, our findings call for the need for continued assertions of Indigenous families' and communities' ways of knowing and being to combat colonial enclosures. Beyond these forms of resistance, we also find the need to open imaginative and creative spaces in which Indigenous families and communities are engaged as dreamers, nation-builders, and future elders. Finally we suggest schools and other educational institutions need to develop new forms of family-community-school partnerships.

Historical Overview of Family Engagement Research

Since the 1960s, parent involvement and family engagement have been explicitly articulated as broad sweeping reform efforts to improve education (Ishimaru et al. 2016). Normative parent involvement literature suggests that increasing parent engagement increases the educational attainment of students (e.g., Epstein 1987; Epstein and Sheldon 2002; Henderson and Mapp 2002). Much of this research, however, focuses on particular practices that are normative to White, middle-class families. These include volunteerism, fundraising, and practicing “school” at home by reading or helping with homework, among others. Power, race, language, and gender are implicated in much of this work but are often silent. In the late 1990s and early 2000s, the rhetoric and policy impacts of parent involvement and family engagement began to address the particular “challenges” of engaging racially and ethnically distinct populations. For example, handbooks on parent involvement were published with chapters pertaining to different racial groups, including “Native” parents (e.g., Berger 2000; Butterfield and Pepper 1991; Redding et al. 2011).

Specific to Indigenous families, the Indian Nations at Risk Task Force (INART), a division of the Department of Education in Washington, D.C., published a landmark report in 1991 on the state of US parent involvement in education and appropriate strategies for ensuring American Indian and Alaska Native (AI/AN) parental participation in schools (Butterfield and Pepper 1991). This report reviewed 100 citations relevant to parent involvement and AI/AN education, including hearings and public testimonies. Like many reports of the time, it included a set of barriers to participation including unwelcoming school climates, differences between home and school cultures, and parental behaviors that may hinder participation such as alcohol abuse, dysfunction, and violence. Unlike many parent involvement handbooks of the time, the INART report critically examined the role schools played in harming Indigenous communities through boarding schools and

removal of children from families and recognized how this history contributes both to the skepticism of AI/AN parents toward educational systems and to systemic health and economic disparities (Butterfield and Pepper 1991). Recommendations from this report tended to propose culturally responsive adaptations to normative practices for AI/AN families but had not yet started to address differences in knowledge systems or to question purposes of family engagement in education.

Within the broader field of parent involvement and family engagement, critical race scholars were also calling attention to deficit constructions and assimilative demands, as well as their consequences, of parent involvement paradigms (e.g., Delgado and Stefancic 2000; Howard and Navarro 2016; Ladson-Billings and Tate 1995; Solorzano 1998). For example, in a persuasive handbook chapter, Baquedano-López et al. (2013) detail the deleterious ways that parents of color are forced to either assimilate to normative schooling *and child-rearing* practices or be labeled as deficient parents. The consequences of these choices on parents of color impact not only educational opportunities for children and youth but often impact familial and community abilities to organize themselves in culturally appropriate and sustaining ways. Furthermore, while critical race scholars have paid careful attention to the classed, gendered, and racialized rhetoric and practices that figure centrally in parent involvement and family engagement, they do not consider the ways that settler-colonialism and the dispossession of Indigenous peoples from their homelands also figures centrally into education and family engagement. Indigenous families and communities continue to be positioned into having to choose between either participating as compliance officers for schools enacting settler-colonial agendas or being positioned as deficient, deviant, or uncaring. Indeed this choice is reflective of a long-standing paradigm in which generations of Indigenous children were removed from their families and placed in foster care. While the Indian Child Welfare Act is designed to stop the removal of Native children from Native families, Native children remain significantly overrepresented in the foster care system reflecting the ongoing disruption to thriving Indigenous families (e.g., White 2017). The characterizations and perceptions of school systems with respect to child-rearing are a critical factor in this ongoing dynamic.

The Rise of Family Engagement Policy

Family engagement is becoming increasingly scaled and mandated through legislation in North America. For example, within the United States, the Every Student Succeeds Act [ESSA] requires Title 1 schools (those serving low-income students), including Bureau of Indian Education (BIE) schools, to have a *written* family engagement policy and to enact it (NCLB 2002; Henderson 2016). This includes funding for family engagement outreach and programs of at least 1% of Title 1 funds received by the district. Schools are required to seek family input on how those funds will be used to support family engagement and evaluate the efficacy of those programs and practices.

These policies arise amid a preponderance of “gap gazing” (Gutiérrez 2008) research that focuses on the disparities and barriers facing students and families of color, including Indigenous families. Couched in this ever-increasing demand for high-stakes accountability and measures to combat the “achievement gap” is a push for normalizing White and middle-class epistemologies as the standard upon which to measure Indigenous students (Gutiérrez 2008; Villegas 2009) and families. These standards promote individuality, meritocracy, capitalism, and consumerism as desirable outcomes of education that perpetuate settler-colonial logics of land as a material resource and assimilation as progress (Villegas 2009). Federal policy and school adoption of family engagement has been shaped by settler notions of family, success, and education; however, because decisions about family engagement and funding are left to individual schools, we think there is potential to shape everyday implementation toward Indigenous futurity.

Through our analysis of the literature, we argue that Indigenous family leadership in schools requires attending to the political dimensions of how family engagement is framed, legislated, funded, and enacted as well as to the everyday resurgence of Indigenous families that contribute to the lived experiences and wellness of our families, communities, and nations. So far we have attended to the political enclosures and opportunities happening at national scales. In the next section, we highlight the enclosures faced by Indigenous families routinely in and by schools.

Refusing Settler-Colonial Enclosure

Equitable and transformative partnerships between schools, families, and communities require collaboration and shared decision-making practices. This means enacting reciprocal relationships between stakeholders where families and community members are seen as teachers with perspectives that matter (Murphy and Pushor 2004). Unfortunately, the literature we reviewed was rife with examples where settler paradigms slipped into and enclosed (Richardson 2011) even the most well-intentioned family engagement models (e.g., Lipka 1986). In this section we explicate some of the enclosures typical across the literature including racism, tokenism, and railroading.

Racism, Invisibility, and Exclusion

Racism and stereotypes about Indigenous families are common challenges found in the literature we reviewed that spanned across time and places (e.g., Butterfield and Pepper 1991; Coleman-Dimon 2000; Davis 1988; Herzog et al. 2016; Kaomea 2012). In interactions with non-Indigenous educators and school systems, Indigenous families and students face low expectations (Kaomea 2012), stereotypes about cultural practices and beliefs (Kaomea 2012; Lea et al. 2011; Robinson-Zañartu and Majel-Dixon 1996), and systemic barriers to participation in schools (Friedel 1999). In one of the very few large-scale quantitative studies with

Indigenous families, 234 families representing 55 tribes were surveyed about their satisfaction with and perceived efficacy of public, BIE, and tribal schools in the United States. Resoundingly, families expressed their frustration with public and BIE schools, citing disrespect of Indigenous families and a deep concern over the lack of presence of Indigenous cultures in their children's formal educational experiences (Robinson-Zañartu and Majel-Dixon 1996). Tribal schools were viewed more favorably except in the area of special education. When this study was replicated 10 years later, results had not changed (Herzog et al. 2016). Many of the participants made comments that the administrators or teachers did not, in fact, want Native parent involvement (Herzog et al. 2016; Robinson-Zañartu and Majel-Dixon 1996). This form of exclusion occurs regularly for Indigenous families, particularly when they do not participate in school-sanctioned ways (e.g., compliance). Friedel (1999) writes:

Public schools, like residential schools, tend to remain closed to Native parents; they continue to exist as isolated 'islands' outside the community. Where residential schools might be viewed as cultural invasion, perhaps public schools can be seen as 'cultural occupation.' In both cases parents remain on the outside looking in. (p. 142)

In addition to overt racism and exclusion, Indigenous families and students face invisibility within schooling curricula and pedagogy (Hare 2012; Garcia 2014; Kaomea 2012). This invisibility perpetuates non-Indigenous educator perceptions of Indigenous parents as having deficient parenting skills and a lack of interest in children's education. However, there has been excellent research that examines and contrasts family and community-based practices with those of schools to demonstrate the problem is not about deficiency or interest but one of visibility. For example, Hare (2012) studied the family literacy practices in five Anishinaabe Head Start centers in Canada and compared them to school literacy practices. She notes that oral history, being on the land, and engaging in ceremony all contribute to the developing literacy practices of Indigenous children that shape how they see and make sense of the world. In particular, Hare argues that reading and renewing relationships with land are important literacy practices of Indigenous communities that are most often overlooked when schools assess the capabilities of Indigenous students and families. She writes:

Young indigenous children learn to interpret their environment and understand the significance of place, territory and landscape through land-based pedagogies, which emphasize stories, specific teachings, observation and experiential learning. They are 'reading their world' and, in doing so, learning their histories, ideologies and identities. (p. 407)

In this compelling example, family practices and land-based education practices that support Indigenous children's learning and identity development are both missing and invisible in formal schooling practices. Further, we suggest that these practices and forms of learning are reflective of Indigenous knowledge systems. While educators may not explicitly subscribe to western supremacy and assimilation, dynamics of erasure and invisibility are nonetheless reflective of these

historicized dynamics and create school contexts that enact forms of ontological and epistemological violence (e.g., Moreton-Robinson 2011; Marker 2006). However, it is also critical to note that these dynamics do not lead to practices and solutions defined by unexamined forms of multicultural inclusion.

Tokenism and Inclusion

Overwhelmingly, the literature demonstrated that non-Indigenous educators and administrators often lack an understanding of the history of schooling with respect to Indigenous communities or the ways in which schools continue to be shaped by and reflect settler-colonial agendas. Further, much of the literature demonstrated that educators are rarely adequately prepared to engage Indigenous learners in culturally responsive ways (e.g., Castagno and Brayboy 2008). This phenomena has been explored broadly but also with respect to Indigenous knowledge systems (e.g., Barnhardt and Kawagley 2005; Battiste 2002; Deloria and Wildcat 2001), Indigenous science (e.g., Cajete 2000), and literacy education (e.g., Archibald 2008; Freire 1970) among other specific foci. This is uniquely consequential in urban areas where not only are educators ill-prepared to support Indigenous students but Indigenous students may also find themselves socially isolated in dominant-majority classrooms and communities left to navigate racialized dynamics without a peer group (e.g., Johnston-Goodstar and VeLure Roholt 2017).

To remedy this, many schools are turning to community partners to aid in the cultural education of students by establishing cultural nights or bringing in speakers for school-wide assemblies or classroom activities. Sometimes families are brought in for focus groups or listening sessions where they are asked to share their experiences and opinions with administrators or educators (Friedel 1999). While these might be genuine efforts to include families in schools, cultural knowledge and practices are still positioned as extracurricular or peripheral to daily teaching and learning and have not had significant impact on increasing familial belonging nor do they reflect a foundational shift in paradigms which are in service of Indigenous thriving. Indeed Bequette (2009) and Friedel (1999) caution against asking elders, artisans, and other knowledge holders to volunteer their time and expertise, particularly if it is done so as a one-time participation without the intent of sustained or long-lasting partnership as this form of ad hoc, flat, representational inclusion can be deleterious to developing true collaboration. Further, these one-off inclusions tokenize Indigenous families and ways of knowing as non-Indigenous educators “position Indigenous knowledge holders (e.g., Elders, storytellers) as ‘special guests’ rather than foundational” and “non-Indigenous teachers are [then] tasked to rework the curriculum to make it more relevant to Indigenous students’ cultures” (Madden et al. 2013 p. 219). These forms of inclusion are typically framed by unexamined multicultural perspectives that are largely shaped in response to Whiteness and often fail to move the ground from assumptions of western epistemic supremacy and tokenized representational

discourses toward epistemic heterogeneity (Richardson and Villenas 2000). Such forms of inclusion often do not open spaces to create relevant and sustaining learning environments with Indigenous families and community members as leading and empowered decision-makers, thus as Indigenous scholars have long argued are ultimately counterproductive for Indigenous sovereignty and futurities (e.g., Deloria 1971; Vizenor 1989).

False Decision-Making: Railroading and Rubber Stamping

Unfortunately, many family engagement strategies reinforce power and decision-making with school officials and educators rather than engage in broader community deliberation and decision-making that transforms historically saturated power structures (López et al. 2016). Frequently schools will elevate and tokenize individual families to “rubber stamp” initiatives that schools deem important – initiatives that are frequently driven by the imperatives of Whiteness and settler-colonialism (Richardson and Villenas 2000). While there have been some increased efforts for schools to listen to the stories and experiences of Indigenous families, decisions about if and how to utilize those stories and knowledges remain with schools (Murphy and Pushor 2004; Coleman-Dimon 2000). Even when decision-making processes are in place, they are often politically charged spaces where power and privilege manifest and can contribute to within community tensions (e.g., Young 2011). Sharing her own experiences as a parent in a Native program in Alberta and as a researcher, Friedel (1999) describes how non-Aboriginal staff and administrators in the district continually undermined and prevented the decision-making and implementation of the Aboriginal parent advisory group that oversaw the Native program. She writes:

Instead of being involved in planning and executing the educational program at Sprucewood School as was outlined in the recommendations that were approved by school board trustees, parents are kept busy trying to cope with everyday problems at the school. And they continue to deal with these alone instead of with the help of the Aboriginal community as was proposed in the recommendations. (p. 151)

Collaborating with Indigenous families in order to center and honor Indigenous knowledges and practices in schools is paramount to the educational success of students; however, doing so without first acknowledging the historical legacy of settler-colonial education on Indigenous communities allows for erasure of such history and enclosure of decolonial possibilities (Lipka 1986). Further, engaging Indigenous families in western forms of decision-making processes (e.g., hierarchical decision-making that reinforces the status quo) will not contribute to extensive transformations. Indigenous forms of deliberation, diplomacy, and decision-making as collective processes that attend to here-and-now urgency as well as being accountable to past and future possibilities and enclosures (e.g., Comtassel and Scow 2017; Whyte 2017) offer new pathways for family leadership and engagement.

Resurgence in the Everydayness of Families

Everyday enactments of Indigeneity and processes of decolonization and renewal matter for the wellness and strength of Indigenous nations, and they are pragmatic and empowering for families. In spite of the clear racism, tokenism, and assimilative imperatives inflicted on Indigenous families, there are also promising new practices and models for family engagement that *begin with* Indigenous families as the foundation for healing and education. Importantly, as we reviewed literature, we noted that there was a marked shift in scholarship which focused on family well-being and cultural resurgence. This scholarship also tended to have a marked difference in the methodological approach and sensibilities – more specifically it utilized Indigenous methodologies (e.g., Smith 2013). Increasingly scholars seem to be recognizing historicity in approaches to Indigenous family engagement and working to engage Indigenous families as nation-builders and changemakers in educational reform. In short, they often articulated pathways of Indigenous resurgence that begins and continues with families. While protecting and evolving treaty rights and other legal expressions of Indigenous sovereignty will remain critical, an important emergent edge in this work is to focus, support, and understand resurgence in the everyday forms of practice in family life (Cornthassel and Scow 2017). From this perspective, the vitality and growth of everyday resurgence in Indigenous families across our communities is what will continue to grow our sovereignty and nationhood.

Focusing on everydayness through analysis of family roles, relations, and responsibilities is a promising strategy. Cornthassel and Scow (2017) did just this through an analysis of Indigenous fatherhood and articulated four dimensions of everydayness to attend to including relationality, convergences of time and place, politics of intimate settings, and gender relationships. Cornthassel and Scow (2017) argue that much of the resurgence literature takes up the political and legislative stances of nationhood and sovereignty, and also importantly there is opportunity to explore the processes of resurgence in intimate settings. They argue that “the processes that Indigenous peoples assert for self-determination are just as important as the results of that struggle” (p. 56). Central to resurgence is living relationality which they define as the web of interconnected human and more-than-human relations and responsibilities that define us as Indigenous peoples. In connecting relationality to Indigenous resurgence, they write: “by examining lived relational aspects of being and becoming Indigenous, we effectively subvert universal generalizations and localize struggles for family resurgence and personal decolonization” (p. 58). For example, the authors turn to their own roles, relationships, and responsibilities as fathers and “other-fathers” to examine the intimate acts of fathering that contribute to the well-being and wholeness of children, families, and through this nations. Reflecting on these roles also demands attention to decolonizing gender constructions and gendered relationships. Cornthassel and Scow’s (2017) suggest many of the gendered roles and politics expected of families are based on colonial forms of gendered binaries that do not often reflect or respect traditional practices, particularly for two-spirit, queer, and trans identifying Indigenous peoples. As the authors put it, “After all, community ‘traditions’ are constantly changing and evolving. Even our community notions of complementarity in terms of gender roles

need to be rethought and considered from queer or two-spirited perspectives” (p. 63). As mothers, daughters, aunts, cousins, and women, we are continually working through our desires and expectations of roles, relations, and responsibilities as well and those projected on to us. Further, we are always also working to renew our relations across roles which can and often do include resisting and refusing powered dynamics defined by colonialism.

Working from our own felt theories (Million 2009) – that is the things we know and feel that we may not always have the words for but sometimes the songs for – we are learning to move and act in our everyday lives with relentless critical awareness (e.g., Mignolo and Tlostanova 2006; Mignolo 2011) and decolonization on the one hand and on the other an unwavering reach for well-being, love, fierce grace, and strength that enmesh Indigenous ways of knowing and being in the here-and-now. Through focusing on the everyday, we can more intentionally refuse (e.g., Tuck and Yang 2014) the ways in which ongoing colonization and neoliberalism invade and try to restructure our daily lives but also refuse living in the negation or shadow of settler-colonialism. Many Indigenous scholars have long called for not only a focus on the content of our practices but perhaps even more importantly on enacting the processes by which our knowledges and ways of being have come to be. Deloria (2001) in discussing Indigenous learning states “we should be concerned with re-creating the conditions within which this learning occurred, not merely the content of the practice itself (pp. 58–59).” From this perspective, the everydayness of our families is critical site of re-creating the conditions for learning for children and families but also those that propel our resurgence.

Cornthassel and Scow (2017) identify renewal and remembering as two key daily acts that are subtle yet powerful in their ability to transform relationships and potentially systems. Renewal refers to the daily interactions that strengthen our relationships and model how we are to be as Indigenous peoples: “They help us focus on the things that matter” (p. 62). Remembering refers to intentional acts of knowing the histories and relationalities of our peoples, lands, and waters in order to “enact our deepest love” (p. 63). One of the authors, Mick Scow, says that for him remembering includes returning with his family to their homelands and relations, but it also means building new relations with people and lands and waters where he now lives. These moments in everydayness and the ways they unfold can also be important convergences of time and place. They argue that attending to everydayness allows us to see and (re)act to the here-and-now as well as keep in view the past and present manifestations of possibility and enclosure. We suggest this longer-term and nonlinear view of time and place opens up new landscapes for decolonization and refusal of settler paradigms of child-rearing and separation from land.

Renewing and Remembering Roles, Relations, and Responsibilities with Lands, Waters, and More-than-Humans

Renewing and remembering includes our relations with lands and waters and is critically missing from family engagement policy and practice in the United States.

Reading the land has always demanded complexity and attention to time scales beyond human scales and forms of deliberation that support complex ecological decision-making (e.g., Whyte 2018). However, learning to read the land is itself a complex and lifelong teaching and learning process that happens in Indigenous families' and communities' daily interactions (e.g., Marin and Bang [accepted](#); Bang et al. 2014; Hare 2012). While a review of land-based education (e.g., Simpson 2014; Tuck et al. 2014), which is focused on Indigenous learning as emergent from our relations and practices with lands, waters, and more-than-human relatives, is beyond the scope of this paper, we would be profoundly remiss to not acknowledge that this growing body of work has important implications for family engagement. In our review, we found very little literature explicitly articulating this nexus between land-based education and family engagement – at least with respect to schooling contexts. This absence is loud and in our view reflective of the dominant paradigm of centering schools and the west – not renewing and remembering our roles, relations, and responsibilities in the everyday. Increasing work that engages land-based perspectives and Indigenous family engagement could be an important area of development.

Renewing and Remembering Relationships Across the Life Span

Educational institutions have evolved to be predicated on age segregation. While this is in part because of the way neoliberalism constructs labor markets, it is also reflective of a particular view of learning and child development. These forces restructure roles, relationships, and how we enact our responsibilities to one another. These changes in interaction have had significant impacts not only at macroscales but also at micro-interactive levels that have shifted how children learn and participate in everyday activities (e.g., Rogoff 2014; Alcalá et al. 2014; Mejia-Arauz et al. 2018). An important aspect of everyday resurgence is working to remember and renew relationships across the life span and engagement in intergenerational learning. Such forms of learning carry significant implications for the ways in which institutions are structured. While we think there is room for significantly more work in this area, there are two areas of research that we highlight below.

Caregiving relationships in the early years are fundamental to raising and socializing Indigenous children into Indigenous ways of knowing and being. Many scholars contend that the early years of a child's life are foundational for the development of their identities as Indigenous peoples and prepare them to be leaders and members of their nations (e.g., Flear 2006; Romero-Little 2010; Muir and Bohr 2014). As such, participation in cultural activities in the intimate and public spheres of their lives is essential. For example, Garcia (2014) begins his paper on reimagining school-community relationships with a story of the ceremonies that renew relationships between young people and the community in order to reimagine what formal K-12 school-community partnerships could look like. He writes:

In [Hopi naming ceremonies] my daughters were shielded from Dawa (sun) for 20 days upon which they were properly introduced after my family — primarily members of the Hoaspoa (roadrunner) clan — came to wash their hair with their Tutsmingwu (white ear of corn representing her mother) and offered a Hopi name. This is one of many initial phases that reaffirms a sense of commitment and a formal acknowledgement of our collective roles and responsibilities as a clan and as an extended family to our children. Though we may perceive this ceremony as one in which we formally introduce our children to the world with many blessings, in many respects it speaks to a larger expectation— that requires each of us to live into the roles of supporting and nurturing our children throughout their lifetime. (p. 61)

Ultimately, Garcia (2014) calls for partnerships with schools that build upon the relationality central to Indigenous families and communities. This means expanding current conceptions of “family” to include the multitude of relationships that make up children’s support systems, not just “parents.” But it also means providing time and space for Indigenous and non-Indigenous families and educators to (1) recognize and unpack histories of oppression, resilience, and resurgence, (2) collectively identify barriers and opportunities for community-defined wellness, and (3) develop new practices that support cross-generational collaboration. Intentionally planning for time and place to be present in the healing and developing of new relations is necessary for Indigenous resurgence.

These early years also prepare children to enter into formal schooling as learners and thinkers (McWilliams et al. 2011; Romero-Little 2010; Lawrenchuck 1998). While there is a plethora of research that posits early childhood centers are assimilative and colonizing spaces for Indigenous children (e.g., Pérez and Saavedra 2017), there is also a demand for high quality and culturally sustaining care for children whose parents choose to work outside of the home. While, these centers need to prepare children to navigate mainstream educational systems as they enter K-12 schooling (Romero-Little 2010), a key need is for the development of learning environments in which this preparation is not detrimental to children learning their own ways. Positioning children to learn and develop expertise in Indigenous ways of knowing and being in opposition to academic success on western terms is a social construction shaped by historicized conquest narratives and claims to singular epistemic paradigms. Human beings have the capacity to speak multiple languages, make meaning in multiple ways, and navigate across multiple contexts. Developing learning environments that can accomplish such forms of life will require collaboration between Indigenous families and early childhood centers (both Indigenous and non-Indigenous) to collectively design and implement pedagogy and practices that support young children’s development as whole and healthy Indigenous people. This is no small task, yet there are now multiple models for integrating Indigenous family leadership in the design and implementation of early childhood programming (e.g., Hubbs-Tait et al. 2005).

For example, Romero-Little (2010), in studying Cochiti Pueblo and Jemez Pueblo resurgence, contends that families are actively combating colonial pressures of assimilation through ownership of Head Start centers on the reservations. These communities are laying the grounds for both renewing and remembering traditional socialization

practices and preparing young children for western forms of education by being a part of the planning and implementation of learning in the Head Start centers. This includes daily commitments to speaking the language in homes and creating language nests in early childhood learning centers where children spend most of their day.

Recognizing the need to address high rates of poverty and mental and physical health issues, many models of early childhood learning also integrate other social services to support families (Kaomea 2012; Lawrenchuck 1998; McWilliams et al. 2011). These often include training for families on effective and culturally appropriate child-rearing strategies. As Muir and Bohr (2014) put it, “Colonialism, residential schools, racism, and poverty have marked family relationships in a multitude of destructive ways that are only beginning to be understood” (p. 68). A key challenge for many social programs, including early childcare, will be to reimagine programs so that they offer safe spaces for intergenerational healing and learning of traditional practices rather than enclosing family trainings that definitize and assimilate Indigenous families into Whiteness. Furthermore, there is a need for more explicit attention to gender norms, roles, and expectations within the current literature.

Multigenerational and community learnings are key aspects to Indigenous pedagogy and ways of knowing and being. Indigenous children learn from not only those in their family but also from elders and other adults and children in community. We also recognize that the burgeoning field of Indigenous studies affords us intellectual relationships with Indigenous knowledge holders globally through scholarship and research. In addition to caregiving as a multigenerational learning and teaching process, we also found two distinct ways of connecting youth and elders within communities reflected in the literature: through youth-driven community engagement and school-based collaboration with elders and artisans to develop and implement curriculum and pedagogy.

Indigenous youth will be at the forefront in sustaining our Indigenous communities and they will no doubt be faced with the responsibility of navigating socio-cultural, environmental, political and economic issues while simultaneously preserving their Indigenous knowledge systems. (Shirley 2017, p. 164)

As expressed in the quote above, many scholars recognize the importance of Indigenous youth leadership in education and research (e.g., Shirley 2017; Tuck 2015). And many programs now exist that allow for youth-driven design and implementation of Indigenous-specific programming. Castagno and Brayboy (2008) provide a synthesis of key principles for culturally responsive schooling for Indigenous youth. One of these principles is that “schooling must be connected to student lives, engaging, and collaborative to be effective and culturally responsive for Indigenous youth” (p. 979). This requires explicit connections between learning opportunities and community wellness such that youth can visibly see the impact of their learning and leadership within their communities (Castagno and Brayboy 2008; Lee 2007). This also requires long-term collaborations between elders, artisans, and community members to collectively design and implement culturally responsive

curricula and pedagogy (e.g., Bequette 2009; Lipka et al. 2005, Madden et al. 2013; Murphy and Pushor 2004; Zeegers 2011).

Community-based education models (CBEM) are one way Indigenous communities are addressing this need for holistic and meaningful learning for Indigenous students (e.g., May 1999). For example, Lee (2007) provides a case study of a New Mexican CBEM secondary school aiming to transform western educational systems to be more culturally relevant to their community by utilizing field-based, hands-on, and Indigenous pedagogies. As part of the program, math, science, and tribal governance lessons occurred in the afternoons in Pueblo communities. Lee (2007) describes:

[S]tudents had immediate and in-depth interaction with community members and environmental issues that affected the communities over the course of an academic year. Thus the community sites became the learning environments through the involvement of community members as partners and mentors and resulted in lasting benefits for both students and communities. (p. 201)

Integral to the success of this program was the weaving together of multiple forms of pedagogy and knowledge. Teachers in the school worked intimately with Pueblo environmental administrators and leadership to generate important themes for curricular design. “The school developed the specifics of the curriculum organized around these thematic issues so that the field experiences and classroom learning supported and complemented one another” (Lee 2007, p. 202). Students also took leadership in their own learning to seek out knowledge holders about treaty rights impacting water and land relations in the community. This collaboration between teachers, Pueblo administrators, community members, and youth demonstrates that multiple forms of expertise, experience, and activity are necessary to develop rich and meaningful learning opportunities that engage real-world problems. Beyond programming *for* Indigenous youth, providing opportunities for youth to meaningfully engage in and make decisions about their own education is paramount to cultivating their leadership and analytic skills, both of which are critical for addressing twenty-first century demands.

Extending these findings, we argue that collaboration between schools, families, and community also builds resilience and adaptive capacity, thereby contributing to Indigenous collective continuance (Whyte 2018). Resilience and adaptive capacity here refer to the ability of a community to “maintain its members’ cultural integrity, health, economic vitality, and political order into the future and avoid having its members experience preventable harms” (p. 355). We believe that explicit attention to onto-epistemic navigation practices that prepare youth for living in increasingly diverse and mobile communities also support collective continuance (e.g., Bang and Medin 2010; Shirley 2017). Onto-epistemic navigation is necessary to work through current local and global problems while maintaining Indigenous knowledges and ways of knowing. For Shirley (2017) this requires not only teaching students their histories from Indigenous perspectives but also helping them navigate the emotions that come up through the learning process. Teachers have to engage both the heart and the mind to help Indigenous youth heal as they examine the ongoing traumas

Indigenous people experience through helping them make change in the present and future. In order to contribute to everyday resurgences, collaborations between schools and families will likely require a commitment to everyday forms of Indigenous learning, predicated on the relationality between multiple generations of community members.

Reimagining Relationships with Non-Indigenous Educators and Systems

Respectful and reciprocal relationships are foundational for cultivating the types of long-term collaborations necessary for Indigenous resurgence. There needs to be increased efforts at preparing Indigenous educators to work with Indigenous and non-Indigenous learners. However, currently most Indigenous children will encounter predominately White women in formal schooling. The views of these educators about Indigenous children, families, and communities shape not only their practice and interaction with students but also the success of any collaborative effort. When non-Indigenous educators lack historicity and hold deficit views, Indigenous families are more likely to refuse engagement (Lipka 1986), instead opting for protective and proactive strategies at home. However, we also see possibility in the construction of new forms of engagement that work toward Indigenous resurgence. Many authors recognize the need to build non-Indigenous educator capacity to work with Indigenous families as well as their ethical commitments to Indigenous communities' well-being. Building trusting and collaborative relationships requires critical reflection and ongoing renewal of relationships. For example, racism, exclusion, and railroading are still common barriers faced by Indigenous families in school contexts. Explicitly and intentionally addressing deficit assumptions about Indigenous families is required before partnerships can be formed (Kaomea 2012). This includes recognizing and honoring the history of colonialism and resurgence of Indigenous peoples globally as well as the particular histories of the families non-Indigenous educators are working with. Another way to address deficit assumptions is home-visiting, where educators engage families in their homes and in community events to learn more about the students and families they work with (Lowe and Bubb-Conner 2014; Murphy and Pushor 2004). This flips the family engagement paradigm so that it is non-Indigenous educators who go to community, rather than families going to school. Further, it disallows a view of Indigenous families as unengaged or uncaring.

Impacts of Indigenous Family Engagement on Academic Outcomes

Academic outcomes based in western knowledge systems do not need to be antithetical to Indigenous futurity. Indeed navigation of international diplomacy and resisting problematic policy means that our peoples will need forms of expertise in knowledge systems outside of our own. Within the family engagement literature we reviewed, there was a simultaneous denouncement of the rise of

standardization and accountability to Whiteness and also the commitment to academically rigorous learning and achievement. It is clear from our review that educational attainment should be considered successful when Indigenous children and communities are healthy and thriving (Akee and Yazzie-Mintz 2011). As we saw in the above findings, this includes meaningful learning opportunities that also contribute to Indigenous community well-being and continuance of knowledge and language.

There is now robust research to demonstrate that young people who are deeply connected to their peoples, lands, and waters are also more likely to be resilient in formal education (LaFramboise et al. 2006; McMahan et al. 2013) and more likely to pursue and persist in higher education (Akee and Yazzie-Mintz 2011; Guillory and Wolverson 2008). In an examination of the disparity between US White and Indigenous attainment of higher education, Akee and Yazzie-Mintz (2011) surveyed the experiences of 62 college graduates, representing 44 tribal nations. Specifically, they asked graduates for the familial and cultural experiences that most hindered or contributed to the completion of their degree. Authors found that all respondents had some exposure to Indigenous history and culture in their schooling and most engaged routinely in Indigenous practices and ceremony. For example, authors found that 30% of respondents learned their Native language in school, and 75% spent time with elders. Akee and Yazzie-Mintz contend that these experiences contributed to the success of Indigenous scholars. They write:

Our results... indicate that individuals who were more exposed to indigenous cultural activities were less likely to take a break between high school and college. Additionally, we found that the more exposure a student had to Native cultural activities as a child, the more likely they were to attend a large Research I university. (p. 136)

Creating opportunities for young people to engage regularly with Indigenous cultural practices and in their language supports academic achievement, rather than hinders it. When young people have regular opportunities to recognize their own histories, practices, and languages within school-based education, they are more likely to develop discipline-specific identities that contribute to their resilience and creativity in schools.

In conclusion, Indigenous family and community engagement practices should consider four principles highlighted throughout the chapter: (1) learning from and with our lands, waters, and more-than-humans is integral to Indigenous family engagement, (2) multigenerational and lifelong learning are integral to Indigenous education and therefore foundational for Indigenous family engagement, (3) relationships and collaboration with non-Indigenous educators and systems need new forms of partnership that recognize and cultivate everyday Indigenous resurgence, and (4) equitable and transformative collaboration with families leads to rigorous academics and higher achievement for Indigenous students. In practice, this requires that educators, administrators, and policy-makers collaborate with Indigenous families in ways that support the inclusion of Indigenous ways of knowing and being in curricula and resist settler-colonial enclosures toward Indigenous resurgence.

Implications and Conclusions

We have argued that attending to and intentionally engaging the everyday in Indigenous families contributes to Indigenous well-being, resurgence, and nationhood. Importantly according to Corntassel and Scow (2017), it is important to resist romanticization of traditional responsibilities and practices. The process of renewal will take many forms, particularly across urban and intertribal contexts as Indigenous peoples envision and enact solidarities that work toward collective and individual determination and wellness. However there are several key sensibilities in Indigenous family engagement efforts that we rearticulate.

Critical historicity is a necessary foundation for collaboration and education with Indigenous families. Recognizing the global historical legacy of settler-colonialism as well as the local ways schools and Indigenous families have interacted is necessary research for all formal and informal educators working with Indigenous families. This could include talking with local elders and knowledge holders, visiting cultural centers, and online research. It is important to seek out not only the history of colonialism and oppression but to search for resistance and resurgence in your local communities.

Partnerships require reciprocity, respect, and the development of politicized trust. Trust, reciprocity, and respect are foundational aspects of long-term partnerships (e.g., Vakil et al. 2016). Generative partnerships with Indigenous families and communities require explicit recognition that multicultural forms of inclusion blind to Indigenous sovereignty perpetuate colonialism. Indigenous family and community engagement policies were not created to lead to any revolutionary change. In fact, some would posit that they merely shift the blame from structural inequities that governments and societies maintain to Indigenous parents and families. Educators, administrators, and policy-makers must critically consider whom family and community engagement policies and practices are meant to benefit and whether or not these actions are fulfilling their purpose and toward what ends. Indigenous family and community engagement should support Indigenous peoples' self-determination and nation-building. They should build adaptive capacities, visibilize Indigenous resilience, and bolster Indigenous resurgence. The opportunity is to contribute to Indigenous resurgence by contributing to multiple forms of activity and participation.

Non-Indigenous educators and administrators must self-reflect on stereotypical, racist, and privileged assumptions about Indigenous families and how these assumptions have and continue to impact their relationships and interactions with Indigenous students and families. While continuing to challenge assumptions and stereotypes, educators must begin the process of reaching out and serving Indigenous communities in order to build trust. This could take the form of attending cultural events, meeting families on and off campus, visiting homes if families are comfortable with it, and inviting family and community members into the classroom as teachers, collaborators, and decision-makers.

When working with Indigenous families, ensure that your engagement processes and practices reflect a commitment to long-term and sustained collaborations with

multiple families and community members. Utilizing a single family or organization repeatedly contributes to tokenism of Indigenous families and perpetuates asymmetrical power relations. Collaboration should position Indigenous families and community members as meaningful decision-makers in order to create culturally resurgent learning experiences throughout the school year.

Abstract

This section of the Indigenous Education Handbook focuses on “transforming” both the processes and outcomes of education and schooling to more effectively meet the learning and socio-cultural aspirations of Indigenous peoples. The ambiguity in the title of this section is intentional. This is to highlight the dual concerns related to how education and schooling structures in colonized societies function to re/produce dominant social, cultural, and economic interests on the one hand and in turn maintain outcomes of persisting social, economic, cultural, and learning underdevelopment and marginalization on the other. In this regard, schooling and education needs to be struggled over in at least two ways. First, there is a need to critically unpack the functioning of schooling in colonized settings and second, there is a need to work at ways to improve schooling and educational outcomes for Indigenous students. The overarching point here is that we will not have a sustainable social, cultural, and economic revolution of the high and disproportionate levels of Indigenous underdevelopment without a prior or simultaneous education revolution.

Introduction

In most colonized jurisdictions, across the world generally and around the Pacific Rim in particular, Indigenous communities continue to suffer high and uneven levels of social, cultural, economic, and political inequality when compared to non-Indigenous populations. These broader societal disparities are also correlated with educational and schooling underdevelopment. For this reason, the societal institutions responsible for education and schooling remain critical sites of struggle for improving, not just Indigenous peoples success “in” and “through” education, but also within downstream outcomes related to their wider social, political, cultural, and economic well-being. In many of these colonized jurisdictions, there has often been a long trail of well-meaning but mostly unsuccessful attempts to improve Indigenous education. The ineffectiveness of these intervention attempts is seen in the widening achievement gaps between non-Indigenous and Indigenous learners. The chapters in this section of the handbook have engaged directly with issues pertaining to the correlation between the ongoing crises of learning and persisting social, economic, and cultural underdevelopment of Indigenous populations.

This section of the *Indigenous Education Handbook* draws together a number of leading Indigenous scholars who work across different disciplinary backgrounds and perspectives. These scholars not only provide Indigenous perspectives from different national and cultural contexts, they also write about a range of transforming ideas and innovations both “within” and “as a result” of their research informed experience of education and schooling. Many of these scholars have positioned their research writing to an international audience, while others have focused on specific, localized issues that emerge out of particular sites of struggle. As editors of this section, we have intentionally invited contributions that exemplify both of these “generalized” perspectives because the colonization of Indigenous communities, and their interests through education, is not a singular issue. In this sense, colonization is formed in multiple sites, in multiple ways and often simultaneously. A common problematic is that government policies and strategies tend to develop “one off” interventions or sponsor “project oriented” solutions. In fact, many well-researched educational interventions have had negative effects when applied in Indigenous communities in a uniform fashion. Such approaches have not developed major change. There is a need to move beyond these narrowly defined, “silver-bullet” approaches. For many Indigenous communities and peoples, colonization has not gone away, more often it has simply changed shape and is being perpetrated in new ways. Many of these new shapes reflect the neoliberal global context and are therefore formed at the intersection of cultural oppression and economic exploitation.

There is a need for Indigenous communities to critically challenge these, “one off,” singular solutions to intervention developed and sponsored by dominant colonial State agencies. A critical perspective here is Why are we still using these supposedly transformational models when they are not that successful? What has been transformed for Indigenous communities and why is the educational achievement gap between Indigenous and non-Indigenous students widening rather than closing? In the New Zealand context, the use of narrow, single-focus projects has had minimal impact in producing any significant broad-based change and the “status quo” of existing unequal social, cultural, and economic relations has been “successfully” maintained.

It is for this reason that the contributions to this chapter are located within what has been called a “360 intervention approach” (Smith 2015b, 2017). This approach seeks to move beyond singular, project-oriented interventions that simply “block one hole in a dam that is leaking in multiple places.” In this view it is argued that there is need to develop multiple interventions, utilizing multiple strategies that respond to multiple issues. That is, the broader Indigenous struggle for social, economic, and cultural change needs to employ transforming methods that are similarly positioned to respond to multiple impediments, across multiple sites, and utilizing multiple tools and strategies.

There is little doubt that educational research is synonymous with power and control: power over what ideas and findings matter and from whose perspective. This section of the handbook promulgates the idea that Indigenous-centric educational research, undertaken by Indigenous scholars, must be *both* transformative and transforming. Education and schooling are complex sites of cultural oppression and therefore require a broad range of complex responses. Subsequently, the contributing authors in this section come from different disciplinary bases and canvass a range of educational and schooling sites and issues. What they do share in common is that they are all focused on transforming Indigenous educational processes and outcomes.

Notwithstanding the standard concerns associated with social, economic, gender, and cultural variables, the articles assembled in this chapter also explore a range of other critical variables, for example, perspectives related to geographical context, disciplinary viewpoint, technology impact, migration, classroom pedagogies, language revitalization, education systems, critical education theory, and the self-development of edu-cultural aspirations. While these variables individually might be considered difficult, the intersecting and overlaying of multiple variables create further complexities that may obscure rather than help improve and transform Indigenous education and schooling outcomes. This too is another reason why this section is important. It assembles an eclectic array of Indigenous scholars who have ideas to share about “understanding” and “resolving” Indigenous educational concerns. These authors bring many “eyes” and “minds” to these wide-ranging and complex issues. Many of these authors have already produced important research and writing that have significantly influenced different parts of Indigenous education struggle.

For example, Greg Cajete's seminal text "Look to the Mountain" (1994) was an important contribution that helped articulate the recognition of the validity of Indigenous knowledge and thinking as also being a legitimate form of "science." Sandy Grande's "Red Pedagogy" (1992) positioned the importance of critical analyses in the unpacking of Native Education in order to accurately understand what is going wrong so that potential solutions could be more effective. Bagele Chilisa's *Indigenous Research Methodologies* (2011) complemented the work of Linda Smith (1999b), Shawn Wilson (2008), and Maggie Kovach (2009) in positioning the significance of Indigenous research approaches, building "space" and validity for Indigenous research methods and theories within the existing research options of the academy; Sheila Meek-Cote's, *Colonised Classrooms: Racism, Trauma and Resistance in Post-secondary Education* (2014) revealed the ways colonization and its violence are not only historical experiences, but also encounters that are negotiated daily in present-day universities and colleges across multiple colonized countries. These are just a few of the important works aligned with the contributors to this chapter.

Through the contributions assembled here, we open up the opportunity to share critical insights, transforming strategies, research learnings, and applied solutions across different cultural jurisdictions. It also allows different Indigenous communities to bench mark not just where they are up to, but how effective their individual gains have been. Additionally, the contributions to this section offer contemporary interpretations and applications of what Indigenous realities were, are, and could potentially be. The chapters illustrate ways we can employ new strategies of indigeneity, supporting the stance that Indigenous scholarship should be an unashamedly Indigenous-centric space which does not rely on "seeking validity or approval from other worldviews, and it is not couched in the epistemes of others" (Edwards 2012, p. 44). The prospect of actively applying Indigenous knowledge in ways that disrupt euro-centric knowledge systems is in itself a transformative endeavor.

It makes sense to reflect cross culturally with other international Indigenous research that coalesces around concerns to transform the high and disproportionate levels of Indigenous educational underdevelopment. In this sense, it is important to get beyond merely consulting among ourselves and to instead develop more sophisticated, collaborative and "in-depth" approaches for attacking the persistence of Indigenous educational under-development. In this regard, transforming education and schooling is an important pre-condition to the broader struggle of transforming the social, economic, cultural, and political under-development that reflects the colonized positioning of many Indigenous populations. As noted elsewhere;

Indigenous communities will not have a sustainable social and economic revolution without a prior or simultaneous education and schooling revolution. (Smith 2015b)

In his paper "Envisioning Indigenous Education: Applying Insights from Indigenous Views of Teaching and Learning," Dr. Gregory Cajete, a Native American (Tewa) scholar, explores an approach to the visioning of contemporary Indigenous education, teaching, and learning through the lenses of Indigenous cultural thought

and epistemological orientations. Aspects of Indigenous teaching and learning are discussed related to the ways metaphor, and social consciousness have traditionally functioned in Indigenous communities-related socio-cultural education. The deeper psychological nature of Indigenous thought, as an integral part of human learning, teaching, and socialization, is also explored. These explorations form the basis for advocacy toward a integration of Indigenous thought as an essential foundation for contemporary intergenerational education in the context of Indigenous community.

In the paper entitled ► [Chap. 44, “Psychosocial Analyses and Actions for Promoting Restorative Schools: Indigenous Determinants Connecting Three International Sites,”](#) a multinational study led by Māori scholars Drs Angus & Sonia Macfarlane (et al.) is reported on. In this chapter, the authors argue that changing demographic patterns around the world pose new challenges to the constructions of being, belonging, and identity, demanding a deeper insight into the dynamics that test the resolve of people to coexist more amicably. For school communities, this means adopting a stance that positions students and teachers within a safe and enabling educational environment. The authors propose that how disciplinary protocols are embedded and enacted within these environments is critical to how coexistence is manifested. The chapter discusses the ways authoritarian disciplinary sanctions are operationalized with spontaneity and are seen as a preferred “quick fix” for student behaviors that are deemed unacceptable. However, a growing body of evidence indicates that such courses of action can seriously hamper, rather than improve, a student’s sense of being, belonging and identity – by negatively impacting on their attitude, behavior, and performance. The chapter ultimately illustrates how restorative frameworks have been actualized in school and community settings and points to Indigenous insights as key determinants driving the measures that are built into these frameworks.

An examination of Hawaiian schooling and education transformation is described in a contribution entitled ► [Chap. 45, “Keaomālamalama: Catalysts for Transformative Change in Hawaiian Education.”](#) This contribution has been co-authored by a number of renowned and experienced, Hawaiian educators coordinated by Dr. Keiki Kawai’ae’a. The authors argue that the “ohana” (extended family) structure and thinking is central to learning and is also important in stimulating the vibrancy of the community. Through the lens of an “ohana mindset” educational transformation begins to recenter, reshape, and reinvigorate educational models and initiatives that can successfully sustain thriving communities. The chapter describes a number of initiatives in which this “mindset” has been a catalyst for change within the Hawaiian education and schooling system over the last 30 years. Furthermore, this “mindset” has had a subsequent impact, influencing educational reform more generally, leadership approaches, and policy framing. Lastly, the key elements and lessons learned from this culturally oriented transforming approach are identified as the basis of a transforming vision and philosophy that builds a more positive and optimistic outlook for Hawaiian learners – *i ke ao mālamalama* (an enlightened world).

► [Chapter 46, “The Va’atele Framework: Redefining and Transforming Pasifika Education”](#) is co-authored by Pasifika scholars Dr. Rae Si’ilata, Dr. Tanya Wendt Samu, and Alexis Siteine. They argue that there is need to transform current, narrow

notions of culturally responsive practices for Pasifika learners. Moreover, they argue that teachers and educational leaders must move beyond narrow learning and schooling practices that emphasize the need for Pasifika learners to adopt majority culture, language, literacy, and identity in order to achieve academic success. This chapter develops a contrary position. It explores the process and outcomes of transforming education and schooling to better meet both the learning and cultural aspirations of Pasifika peoples in Aotearoa, New Zealand. A Pasifika metaphor of the *Va'atele* is offered as a framework for Pasifika learners' success in order that schools and educators might understand how it is possible to both privilege and utilize students' linguistic and cultural resources within curriculum learning at school. (*Va'atele* is the Samoan name for the ocean-voyaging double-hulled canoe of Pasifika peoples.) In this way, Pasifika learners can make meaningful connections between home and school forms of knowledge and are able to experience success across both domains. This study presents evidence from two distinct but related case studies that draw attention to the central roles teachers and school leaders play in enabling Pasifika learners to connect, rather than replace, the worldviews, languages, literacy practices, and experiences of their homes with the valued knowledge and literacy practices of school.

The paper entitled ► [Chap. 47, "The Age of Reconciliation: Transforming Post-secondary Education"](#) is authored by Canadian and First Nations scholar, Dr. Sheila Cote-Meek. It responds to the recent release of the Truth and Reconciliation's (TRC) "Calls to Action" in Canada that has caused many postsecondary institutions to re-examine how they provide educational services to Indigenous students. Cote-Meek argues that it is important to recognize that Indigenous peoples have been advocating for changes to the education systems for many decades and that any transforming of education needs to have a broader, more considered focus rather than reactive, emotional (sticking plaster) responses driven by crisis events such as the Commissions enquiry into Residential Schooling. Drawing on personal and professional experience, the author focuses on transformative strategies that have been successfully utilized to bring about a positive movement of change to support Indigenous learners at one postsecondary institution in the province of Ontario. This chapter emphasizes that the transforming work being accomplished today is rooted in both past and present, and recognizes the challenges and complexities of bringing about more meaningful and sustained change.

Alaskan Native and Hawaiian scholar, Dr. Malia Villegas was the Director of the Policy Research Center for the National Congress of American Indians in Washington, D.C., at the time of writing this important paper. Her contribution is titled ► [Chap. 48, "Invisible Light: Using Data to See Native Youth and Families in Policy."](#) In this chapter, Dr. Villegas describes a range of efforts by tribes and tribal advocates to improve the appropriate use of data in decision-making and community planning. She discusses approaches such as mapping existing government data, data disaggregation, and strengths-based evaluation. Critical insights coming from this work include fostering Native-to-Native comparisons, developing community-based indicators, shining a critical light on system accountability, and establishing an ethics framework for data development.

Sami scholar and researcher Professor Jelena Porsanger discusses the development of the Sami University and its intention to sustain Sami language and culture. In her paper, ► [Chap. 49, “Building Sámi Language Higher Education: The Case of Sámi University of Applied Sciences,”](#) Dr. Porsanger focuses on the institutional goal of sustaining Sámi language through a “purpose built” higher education entity in Samiland, Norway. In particular she examines the evolution of the Sámi University College and its growth to become the Sámi University of Applied Sciences. In this transformation, priority was given to Indigenous language, both as a subject and as a means of instruction. Indigenous knowledge and scientifically “approved” (mainstream) knowledge were treated as equally valid in the elaboration of curriculum and study programs. A series of indicators are examined in relation to language development – including aspirations, motivation, inspiration, limitations, obstacles, challenges, solutions, and success following the key elements of transformative theory espoused in the work of Smith (1997, 1999a). Dr. Porsanger employs some key analytical tools such as the concepts of “language knowledge,” “knowledge transfer,” “knowledge creation,” and “knowledge reclamation.” These analytical concepts derive from the Māori conceptual framework of Mātauranga Māori (Black 2014). The author illustrates the ways these concepts are also relevant and applicable to evaluating Indigenous Sámi knowledge and language development through higher education.

The paper “Diagnosing Elements of Colonization in Indigenous Education: An African Effort to Research and Transform Education for Indigenous Peoples” is co-authored by African scholars, Dr. Kelone Khudu-Petersen and Dr. Bagele Chilisa. This important contribution argues that no matter what academic discipline one pursues there is a concept, a theme, a topic, a subject from the history, culture, experiences, and Indigenous knowledge systems that has been excluded from mainstream discourses either because they did not fit in the academic codes and classifications or because they were considered superstitious, irrelevant, and of no use to human development. In this work, the authors argue that Indigenous-based epistemologies are essential for transformative education. Afrikology is presented as an African-centered epistemology and the underlying philosophy of the proposed decolonization process. Nabudere defines Afrikology as “a philosophical, epistemological and methodological approach that emphasizes that Africa’s achievements are recognized” (c.f. Nabudere 2012). The chapter illustrates possible ways through which every/any education topic in the Indigenous learning context can include a re-search for identities, the revitalization of Indigenous cultures, as well as an integration of Indigenous epistemologies with other knowledge systems. Emphasis is made on the use of Indigenous research frameworks and the use of Indigenous cultural values to identify gaps in current mainstream education.

► [Chapter 51, “Refusing the Settler Society of the Spectacle”](#) is contributed by Native American author Dr. Sandy Grande. This critical work examines the relationship between Guy Debord’s notion of spectacle and settler colonialism, exploring the role that spectacle plays in the solidification of the settler state and the consolidation of whiteness. In so doing, it examines contemporary depictions of Native peoples in the mainstream media, with a particular focus on coverage of

Indigenous peoples at Standing Rock and the #NoDAPL prayer camps. Ultimately, Dr. Grande argues that the ongoing production of spectacularized “Indians” functions to erase and diminish the lived experience of Indigenous peoples and, in so doing, serves as a means to consolidate the re/production of dominant settler power, social, economic, and cultural relations.

Australian Aboriginal academic and scholar, Dr. Lester-Irabinna Rigney has contributed a ► [Chap. 52, “Defining Culturally Responsive Digital Education for Classrooms: Writing from Oceania to Build Indigenous Pacific Futures.”](#) In this work Dr. Rigney argues that digital education, technology-rich schools, and smart classrooms that are shaped by cloud-computing and blended-learning programs are all growing in influence. However, rates of participation for Indigenous students are often still low when compared with non-Indigenous students. This chapter argues that twenty-first-century learning will require new culturally inclusive spaces, spaces that do not override, diminish, or exclude Indigenous cultures but on the contrary, draw upon them as a learning foundation on which to build new digital learning opportunities. Dr. Rigney also argues that while some literature on culturally responsive schooling (CRS) for academic improvement of American Indian and Alaska Natives peoples has begun to emerge, much of this literature is yet to theorize Indigenous online education and associated teaching and learning pedagogies, especially in the Pacific regions. This chapter begins the task of defining culturally responsive digital schooling (CRDS) for Indigenous peoples of the Pacific region drawing from a range of sources including information communication technology (ICT) research, critical and culturally responsive schooling studies. This chapter argues for three interdependent dimensions for Culturally Responsive Digital Schooling: a critical focus on “benefits,” on “decolonization,” and on “cultural responsiveness.” Dr. Rigney argues that understanding these dimensions is a necessary precondition to enable the purpose, effects, and impact of CRDS to be more fully understood. In concluding his paper, the author builds out a culturally informed definition for CRDS and then proposes a ten-point model as a cultural standard aimed at supporting the growth of CRDS Indigenous schooling in the Pacific.

In their co-authored paper, “The Transformative Role of Iwi Knowledge and Genealogy in Māori Student Success” Māori scholars, Dr. Melinda Webber, and Dr. Angus Macfarlane argue that iwi (tribal) knowledge systems hold powerful narratives about the past, present, and future – prioritizing distinct languages, worldviews, teachings, and technologies which are developed and sustained by generations of iwi members. The authors contend that “iwi narratives” that emphasize the innovative deeds, qualities, and achievements of ancestors can be used in education to reinforce the notion that contrary to popular stereotypes that denigrate Māori thinking, knowledge and expertise, Māori students descend from a long lineage of culturally informed “scholars,” “scientists,” “philosophers,” and the like. This perspective negates the powerful effect of self-fulfilling prophecies and stereotype threat (Steele 1997). The chapter details the Ka Awatea (A new dawn) Project. This is an iwi/tribal case study that examined the qualities of “success” through a quintessentially iwi lens by grounding the research undertakings in iwi protocols and history and linking findings to historical iwi icons. To effect

educational transformation and reform, local high schools, in conjunction with iwi in the region, then made a conscious and proactive call to carve out time and space to affirm this iwi knowledge, legitimizing its dignity, identity, and integrity. Webber and Macfarlane argue that speaking to Māori student success from a distinctly iwi perspective revitalized cultural pride among Te Arawa tribal nation students connecting learning to their mana tangata – their proud histories, tenacious present, and promising futures.

The concluding contribution in this section is made by Māori scholars Dr. Linda Tuhiwai Smith and Dr. Graham Hingangaroa Smith. In their paper “Doing Indigenous Work: Decolonizing and Transforming the Academy,” the authors share their expertise and experience of decolonizing and transforming work within institutions of Higher Learning generally and within the Universities in particular. The concern for the authors is move beyond simplistic, surface changes that are mostly cosmetic to seeking more genuine and profound transforming outcomes. Their argument is that Universities need to be struggled over because they are key institutions that define and control what counts as useful, important, and valid knowledge within society. They argue that struggle by Indigenous communities must not simply be for “inclusiveness” into dominant culture, but that it must also challenge and overthrow the complicity of the Universities in the ongoing re/production colonizing imperatives. The intention of this chapter is to assist Indigenous workers within the Academy, many of whom are working in isolation, to share and engage in strategies that might more effectively and powerfully transform the structures and practices of the Academy and ultimately improve the outcomes for Indigenous participants.

Conclusion and Future Directions

On a final note, Indigenous transforming work can be lonely and it can also be dangerous for one’s career, as criticism of the “status quo” is not always well received. This is the reason why Indigenous scholars who are engaged with transforming work need to be acknowledged, supported, and heard. This is why the contributions gathered here in this section of the Handbook are important and significant.

Abstract

This chapter explores an approach to the visioning of contemporary Indigenous education, teaching, and learning through the lenses of Indigenous cultural thought and epistemological orientations. Aspects of Indigenous teaching and learning are discussed related to the ways metaphor and social consciousness have traditionally functioned in Indigenous community-related sociocultural education. The deeper psychological nature of Indigenous thought, as an integral part of human learning, teaching, and socialization, is also explored. These

Portions of this chapter have been adapted from a previously published work: Cajete, Gregory A. (1994). *Look to the Mountain: An Ecology of Indigenous Education*. Skyland: Kivaki Press, pp. 205–228. The terms *Indigenous*, *Tribal*, and *Tribe* are capitalized to add emphasis and to convey an active and evolving identity. (*The term Indigenous is used as the larger inclusive group term, while Tribal refers to specific contexts; both terms are capitalized as an honorific designation. American Indian is used when referring specifically to a Tribe which resides in the United States.*)

Introduction

The Sun Dagger: An Ancient Metaphor for Indigenous Education

High atop Fajada Butte in Chaco Canyon National Park, New Mexico, is a monument to the ingenuity and sophistication of Indigenous thought. By shaping and precisely placing three sandstone slabs against a concave horizontal indentation facing the Sun and then inscribing one large and one small spiral, the ancient Anasazi inhabitants of Chaco Canyon created the only known solstice and lunar marker made by an ancient civilization anywhere in the world. This monument to the genius and cosmological perspective of Indigenous America is appropriately called the “Sun Dagger” and may be viewed as a metaphor for an Indigenous way of coming to knowledge.

Fajada Butte is a high sandstone mesa which rises from the floor of Chaco like a silent sentinel guarding a gateway which leads to the world of an ancient Indigenous past. Chaco Canyon is centrally located in San Juan Basin of northwestern New Mexico. The canyon is the center of a complex of ancient Anasazi Indian sites which date back over a thousand years. The ruins located in and about the canyon are one of the most extensive and elaborate expressions of Anasazi culture yet discovered.

From near the top of Fajada Butte, one can see the winding course of Chaco Canyon and the expanse of dry washes, sandstone mesas, and horizons which seem to go on into infinity. Fajada Butte and its location in the greater context of the Chaco basin is indeed an appropriate location for an Indigenous marker of the cycles of physical and metaphysical time. The geographical context of Chaco Canyon, the natural form of Fajada Butte, and the Sun Dagger in its elegant simplicity, profound sophistication, and harmonious integration into the natural structure of the butte present an extraordinary environmentally based metaphor of the essential perspective which has been achieved by Indigenous education.

The story of the Sun Dagger’s discovery is itself a tale which mirrors of the unfolding process of the rediscovery of the “Indigenous” perspective. Anna Sofaer, an artist recording rock art sites located on Fajada Butte, was the first non-Indian to see the unique play of light and shadow created by the Sun Dagger as the Sun reaches its noon position around the time of summer solstice. What Sofaer witnessed on the fateful day in late June 1977 would change her life and would later force archeoastronomers around the world to reconsider their preconceived notions

regarding the relative conceptual capabilities and level of “scientific” sophistication of ancient American Indian cultures (Fig. 1).

Over a period of several years and tireless effort, Sofaer was able to piece together the amazing ways in which the Sun Dagger marked the cyclic movement of the Sun and Moon. The basics of how the Sun Dagger functions may be described as follows:

The site consists of two spirals carved into the rock behind the three horizontal stone slabs. Just before noon on the days surrounding summer solstice, the knife of light bisects the larger spiral. At winter solstice, two noonday daggers frame the large spiral. Finally, during the equinoxes, the smaller spiral is bisected at midday by a lesser dagger, while a larger shaft of light passes to the right of center of the larger spiral.

The large spiral has 19 grooves, which may reflect the Anasazi knowledge of the 19.00-year Metonic cycle of the Moon, the time required for the same phase of the Moon to recur on the same day of the year. The slightly shorter lunar cycle of 18.61 years corresponds to the time between successive major standstills. At Fajada Butte the Moon’s shadow bisects the spiral at moonrise during the minor northern standstill and just touches the petroglyph’s left edge during major northern standstills. At both places a straight groove has been cut, which is parallel to the Moon’s shadow (Malville and Putman 1991: 32).

The Anasazi understood the complementary movement of the Sun in relationship to the Moon as a visible manifestation of the sacred interplay of complementary opposites expressed throughout the Cosmos. They translated this understanding through various expressions in their ritual traditions and mythology. Thus, the Sun Dagger reflects the integration of Anasazi understanding of the movement of the Sun and Moon through time and space with a profoundly spiritual and sophisticated cosmological orientation. The Sun represented the ultimate symbol of light and of life for the Anasazi. Therefore, they were interested in all aspects of the Sun and traced its journey across the sky throughout the year. They were interested in the relationship of movements of the Sun and Moon to the Earth. The Anasazi strove to resonate their lives, their spirits, and their communities with the natural cycles which they perceived in the Cosmos.

Fig. 1 Fajada Butte. Chaco Canyon, New Mexico. (Cajete, G (1994). Personal Photograph)

Near midday, during the passage of the Sun overhead on the summer solstice, a bright ray of sunlight begins to cut through the three positioned sandstone slabs on Fajada Butte. As the Sun moves closer to its highest point in the sky, the dagger of sunlight becomes more pronounced as it points toward the center of the largest spiral. As the Sun reaches its noontime position, the dagger of light “spears” through the center of the spiral as if heralding, and simultaneously pinpointing, the most sacred and energy-filled time in the Sun’s annual pilgrimage across the sky. In a similarly dramatic way, the interplay of light and shadow created by the Sun Dagger also marks the times of winter solstice, the fall and winter equinoxes, and even the major and minor standstills of the Moon which occur over a cycle of almost 19 years.

In this way, the Sun Dagger metaphorically reflects the very real connection between time, space, and life on Earth with that of the Sun, Moon, planets, stars, and constellations. The play of light and shadow, illumination and orientation mirroring the cyclic evolution of Cosmos recorded by the Sun Dagger, is metaphoric of the creative learning and the honoring of relationship indicative of Indigenous education. The Sun Dagger visually shows the drama of the every moment and all life on Earth. The spirals, like mini replicas of an evolving universe, radiate from a center in concentric rings which show both interrelationship of cycles and a continuity that extends to infinity. It is an elegant instrument that mirrors the Indigenous mind and the focus on negotiating a deep relationship that leads to a kind of resonance with the natural order of the cosmos (Fig. 2).

The Sun Dagger illustrates the essential qualities of the Indigenous worldview predicated on the notion that everything is linked together in the multiverse and that the highest value lies in striving for a balance of relations between humans, other beings, and spirits of the past, present, and future. Other examples of Indigenous thought manifesting into elegant expressions of native science include Polynesian wayfinding, the Mesoamerican calendar, Andean agricultural and road systems, the chinampa and milpa gardens of Mexico, the mound works of the Mississippian cultures, and many other examples throughout the Indigenous world.

Fig. 2 The Sun Dagger site. (Sofaer, A.P. and the Solstice Project. Inc. *The Mystery of Chaco Canyon: Study Guide for Teachers*. Oley, PA: Bull Frog Films. p. 8)

How, then, is the Sun Dagger in its function and its symbolism like Indigenous education? To begin with, learning and teaching are developmental processes that originate with inner experience as a center and radiate out through time and space. Ideally, such a process forms concentric rings of relationship to other experiences of learning to orient and resonate self, community, and culture to the natural world and to ones' place in that world. One cycle of learning is related to the one before and the one after in a continuum of time through the life of the individual, community, and the generations of Indigenous people. Learning is also essentially about continually moving back and forth between light and shadow through the times and experiences that occur through one's life. However, there are times during our life that a focused point of illumination occurs. In extending this *metaphor* through the *Native eye*, it might be said that the creative energy of light (Sun) the conscious or the energy of reflected light (Moon) the unconscious come into their fullest potential. There are also seasons and cycles of "major" and "minor" standstills of creative focus which characterize human learning and teaching that are essential to honor. There is learning in the sunlight (conscious modes) and learning in the moonlight (unconscious modes) which complement one another through a process of education, a process of coming to know and orient oneself to the world. There are pillars or foundations of cultural knowledge and context which at times form and illuminate learning and at other times cast shadows, enclose, or hide to contrast one realm of learning from another. The large and small spirals, around which the dagger of light dances with the shadows, represent the motion and direction of human thought – one rational, one intuitive – both contained within the same space. Finally, profound learning happens when climbing to a high place, overcoming hardship and obstacles along the way, to gain a perspective that gives us a broader, more expansive view. Wisdom and important knowledge can be found only through "looking to the mountain" and then rising above a lower plane to a higher one as the physical metaphor of Fajada Butte and its location in Chaco Canyon so magnificently represents.

The Sun Dagger, Fajada Butte, and the ruins of Chaco Canyon have been abandoned for more than 800 years. In spite of abandonment, the Sun Dagger has continued to mark the passage of hundreds of sacred time cycles of the Sun and Moon. The discovery of this metaphysical symbol and tool of Indigenous America at first was greeted with great doubt followed by controversy among Western scientists. This gave way to a flurry of experiments and observation reduced and decontextualized, in the usual tradition of "objectified" science, to fit it to the tacit infrastructure of Western understanding. Yet, just as the natural reality which it records, its Indigenous message of cultivating a deep understanding of human relationship to the cosmos cannot be denied. For the Anasazi understood, as did other Indigenous peoples, that we are related not only to each other and all other life on Earth, but we are also related to and a part of the greater universe. Therefore, an essential task of Indigenous education was to come to know the nature of this relational orientation, to develop resonance with it, and to honor it! (Fig. 3)

Indigenous Approaches to Education Are Viable Alternatives

Alienation from the underlying ethos of mainstream approaches to education has been one of the consistent criticisms leveled against modern education by Indigenous students. They have been given relatively few choices of school curricula that truly address their alienation beyond compensatory programs, remediation, and programs which attempt to bridge the social orientations of students with those of the school. Rather, most of the attempts at addressing such issues have revolved around refitting the problematic Indigenous student to the very “system” that caused their alienation and failure in the first place. Too often, the Indigenous student is viewed as the problem rather than the inherent and unquestioned approaches, attitudes, perspectives, and curricula of the educational system. The knowledge, values, skills, and interests that Indigenous students possess are largely ignored in favor of strategies, aimed at enticing them to conform to mainstream education. In mainstream education contexts, few comprehensive attempts to research and create content and teaching models which are founded upon contemporized expressions of Indigenous educational philosophies occur. Often, interventions focused on “fitting things Indigenous” to existing mainstream models have little real impact on many students. Hence, the inherent worth and creative potential of Indigenous students and Indigenous perspectives of education generally remain marginalized in mainstream education. As a result many of the brightest and most creative Indigenous students continue to be alienated from modern education.

The alienation of Indigenous students from education and the resultant loss of their potentially positive service to their communities need not continue if we revitalize and reclaim our own deep heritage of education. Indigenous approaches to education can work if we are open to their creative message and apply a bit of communal creativity and action to find ways to revitalize and reintroduce their inherently universal processes of teaching and learning. Indigenous educational principles are viable whether one is learning about the native science of the Anasazi

Sun Dagger or Polynesian Wayfinding, leadership skills through community service learning or about one's cultural roots through creating a photographic exhibit, or learning to develop a sense of place by exploring its concentric rings of ecological relationship.

The creative potential of building upon and enhancing what students bring with them culturally has been explored at a number of Indigenous educational institutions. The development of Tribal community colleges and the evolution of community schools governed by Indigenous peoples offer one of the most plausible areas for the ongoing development of this nature.

Indigenous Education and Its Role in Individual Transformation

Generally, Indigenous education occurred in a holistic context that reflected the importance of each individual as a contributing member of the social group. In this way, Indigenous education sustained a wholesome life process. It was an educational process that unfolded through mutual, reciprocal relationships between one's social group and the natural world. This relationship involved all dimensions of one's being, while providing both personal and technical skills through participation in community life. From this perspective, one might say that Indigenous education was essentially a community-based expression of sustainable, ecologically integrated education (Cajete 1994: 26).

In the context of development of a basic conceptual framework for a viable Indigenous educational philosophy, it is essential that the relationship of Indigenous education to establishing and maintaining individual and community wholeness be seriously considered. Much of Indigenous education can be called "endogenous" education in that it revolves around a transformational process of learning by bringing forth illumination from one's ego center. Educating and enlivening the inner self is the life-centered imperative of Indigenous education embodied in the metaphor "seeking life" or for "life's sake." Inherent in this metaphor is the realization that intellectual understanding in concert with ritual, myth, vision, art, and learning the "art" of relationship in a particular environmental context facilitates the health and wholeness of individual, family, and community. Education for wholeness, by striving for a level of harmony between individuals and their world, is an ancient aspiration in the educational process of many cultures. In its most natural expression, all forms of Indigenous education were *transformative* and nature centered. Indeed, the Latin root "educare," meaning "to draw out," embodies the spirit of the transformative quality of education.

A transformational approach to education is distinctly universal, integrative and cross-cultural because it is referenced to the deepest human drives. From this viewpoint all human beings concern themselves with self-empowerment and with whatever enables them to transform their lives and the conditions in which they live; such a viewpoint engenders the intent of people striving to create whole, happy, prosperous, and fulfilling lives. (Waterman 1989: 1)

The orientations of wholeness, self-knowledge, and wisdom are held in common by many traditional spiritual education philosophies around the world. Taoist, Buddhist, Sufi, Hebrew, and even Christian monastic are spiritual education traditions that continue to focus on these orientations today. Indeed, even though medieval times, all forms of European education were tied to some sort of spiritual training. Education was considered important in inducing or otherwise facilitating harmony between a person and the world. The goal was to produce a person with a well-integrated relationship between thought and action. This idealized outcome was anticipated as following naturally from the “right education.”

The “right education” is, of course, a culturally defined construct, one of whose main criterion is socializing the individual to the collective culture and thought of a group. However, this sort of socialization is only one dimension of education, a first step in a lifelong path of learning. In reality, “right” education sets into motion changes that in time creates a profound transformation of self. For those who are familiar with transformative education, this process is a dynamic creative process which brings a relative level of peace of mind, tranquility, and harmonious adaptation. But, the exploration of self, and relationships to inner and outer entities, also requires a tearing apart in order to create a new order and higher level of consciousness. Harmony of mind, body, and spirit is achieved through such a process, but it lasts for only a short period of time before it again has to be revised as people and their circumstances change. This is the “endogenous” dynamic of Indigenous education.

The process begins with a deep and abiding respect for the “spirit” of each child from before the moment of birth. The first stage of Indigenous education therefore revolves around learning within the family, learning the first aspects of culture, and learning how to adapt and integrate one’s unique personality in a family context. The first stage ends with gaining an orientation to family, community, and place.

Education in the second stage revolves around social learning, being introduced to Tribal society, and learning how to live in the natural environment. The second stage ends with the gaining of a sense of Tribal history and learning how to apply Tribal knowledge to day-to-day living.

The third stage revolves around melding individual needs with group needs through the processes of initiation, the learning of guiding myths, and participation in ritual and ceremony. This stage ends with the development of a profound and deep connection to tradition.

The fourth stage is a midpoint in which the individual achieves a high level of integration with the culture and attains a certain degree of peace of mind. It brings the individual a certain level of empowerment and personal vitality and maturity. But it is only the middle place of life.

The fifth stage is a period of searching for a life vision, a time of pronounced individuation, and the development of “mythical” thinking. This stage concludes with the development of a deep understanding of relationship and diversity.

The sixth stage ushers in a period of major transformation characterized by deep learning about the unconsciousness. It is also a time of great travail, disintegration, wounding, and pain which paves the way for an equally great reintegration and

healing process to begin in the final stage. The pain, wound, and conflict act as a bridge to the seventh stage.

In the seventh stage, deep healing occurs in which the self “mutualizes” with body, mind, and spirit. In this stage deep understanding, enlightenment, and wisdom are gained. This stage ends with the attainment of a high level of spiritual understanding which acts as a bridge to the finding of one’s true center and the transformation to “being a complete man or woman in that place that Indian people talk about.” (Fig. 4)

These stages of interrelationship form a kind of creative continuum, “life way,” which helps us to become more fully oneself, as we move through the stages of our life. Indigenous education traditionally recognized each of the most important interrelationships through formal and informal learning situations, rites of passage, and initiations.

Inherent in Indigenous education is the recognition that there is a knowing Center in all human beings that reflects the knowing Center of the Earth and other living things. Indigenous elders knew that coming into contact with one’s inner Center was not always a pleasant or easily attainable experience. This recognition led to the development of a variety of ceremonies, rituals, songs, dances, works of art, stories, and traditions to assist individual access and utilize the potential healing and whole-making power in each person. The connecting to that knowing Center was choreographed through specific ritual preparation to help each individual on their journey to their own source of knowledge. Through this process the potential for learning inherent in each of the major stages of a person’s life was engaged and set

Fig. 4 Indigenous stages of developmental learning. (Cajete 1994, p. 211)

about the task of connecting to one's knowing Center. This was the essential reason for the various rites of passage associated with Indian tribes and various societies within each tribe.

Since the highest goal of Indigenous education was to help each person to "find life" and thereby realize a level of completeness in their life, the exploration of many different vehicles and approaches to learning was encouraged. This was done with the understanding that each individual would find the right one for them in their own time. But the process of finding one's self and inner peace with its usual implications of being "adjusted," as it is called in modern circles today, was not the central focus of Indigenous education. Seeking peace and finding self was seen to be a by-product of following a path of life which presented significant personal and environmental challenges, obstacles, and tests at every turn. This "individuation," as Jung called it, did not come easy. It had to be earned every step of the way. But in the process of earning it, one learned to put forward the best that one had, and one learned the nature of humility, self-sacrifice, courage, service, and determination. Indian people understood that the path to individuation is riddled with doubt and many trials. They understood that it was a path of evolution and transformation.

Individuation is a work, a life opus, a task that calls upon us not to avoid life's difficulties and dangers, but to perceive the meaning in the pattern of events that form our lives. Life's supreme achievement may be to see the thread that connects together the events, dreams, and relationships that have made up the fabric of our existence. Individuation is a search for and discovery of meaning, not a meaning we consciously devise but the meaning embedded in life itself. It will confront us with many demands, for the unconscious, as Jung wrote, 'always tries to produce an impossible situation in order to force the individual to bring out his very best. (John Sandford 1977, p. 22)

Some Western academics have contended that Indigenous cultures are too diverse to generalize the sharing one form of Indigenous education. At the literal, superficial level of the Western observer and through the lens of their own unexamined bias, this may seem to be true. Yet, the experience of most Indigenous people contradicts this biased notion. While it is obvious that there are a diversity of Indigenous peoples, with an equally diverse variety of expressions of cultural, social, and geographic orientations, when Indigenous people meet each other, they consistently observe and express how much they share in common. These expressions of commonality emanate from a deeper level of worldview. The perception of shared values, ways of thinking, and orientations to the world form this perceived undercurrent unity. A kind of "unity in diversity. Therefore, there can be parallel elemental characteristics which exemplified the transformational nature of many forms of Indigenous and spiritual traditions of education.

Hyemeyohsts Storm (1972), in her book *Seven Arrows*, reflects on a few of the most important elemental ideas of teaching and learning from traditional American Indian perspectives. These elemental thoughts may provide points of reference for learning goals and the development of content areas Indigenously inspired contemporary education. They are meant to simulate thought, further research, and

discussion. However, the “teacher” must provide research and the creative insights and applications in their own context.

First was the idea that learning happens of its own accord if the individual has learned how to relate with his/her inner Center and the natural world. Coming to learn about one’s own nature and acting with accord to that understanding was a necessary preconditioning which prepared the individual for deep learning.

Second, there was the acceptance that at times experiences of significant hardship were a necessary part of an individual’s education and that such circumstances provided ideal moments for creative teaching. A “wounding” or memory of a traumatic event and the learning associated with such events provide a constant source for renewal and transformation which enlarged the consciousness if individuals were helped in understanding the meaning of such events in their lives.

Third was that empathy and affection were key elements in learning. Also, direct subjective experience combined with affective reflection was an essential element of deeper forms of education. Therefore mirroring behavior back to learners became a way that they might come to understand for themselves their own behavior and how to use direct experience to the best advantage.

Fourth was an innate respect for the individual uniqueness of each person which gave rise to the understanding that ultimately each person was their own teacher as far as understanding and realization of their process of individuation. Indigenous education integrated the notion that there are many ways to learn, many ways to educate, many kinds of learners, and many kinds of teachers, each of which had to be honored for their uniqueness and their contribution to education.

Fifth was that each learning situation is unique and innately tied to the creative capacity of the learner. When this connection to creative learning and illumination is thwarted, frustration and rigidity follow. Learning, therefore, had to be connected to the life process of each individual. The idea of lifelong learning was therefore a natural consideration.

Sixth was that teaching and learning are a collaborative cooperative contract between the “teacher” and learner. In this sense the teacher was not always human but could be an animal, a plant, or other natural entity or force. Also, based on this perception, the “teachable” moment was recognized through synchronistic timing or creative use of distractions and analogies to define the context for an important lesson. The tactic of distract-to-attract-to-react was a common strategy of Indigenous teachers.

Seventh was that learners need to see, feel, and visualize a teaching through their own and other people’s perspectives. Therefore, telling and retelling a story from various perspectives and at various stages of life enriched learning, emphasized key thoughts, and mirrored ideas, attitudes, or perspectives back to learners for impact. Reteaching and relearning are integral parts of complete learning. Hence, the saying, “every story is retold in a new day’s light.”

Eighth was that there are basic developmental orientations involved with learning through which we must pass toward more complete understanding. Learning through each orientation involves the finding of personal meaning through direct experience. The meaning that we each find is always subjective and interpretive, based on our relative level of maturity, self-knowledge, wisdom, and perspective.

Ninth was that life itself is the greatest teacher and that each must accept the hard realities of life with those that are joyous and pleasing. Living and learning through the trials and pains of life are equally important as learning through good times. Indeed, life is never understood fully until it is seen through difficulty and hardship. It is only through experiencing and learning through all life's conditions that one begins to understand how all that we do is connected and all the lessons that we must learn are related.

Tenth was that learning through reflection and sharing of experience in community allows us to understand our learning in the context of greater wholes. In a group there are as many ways of seeing, hearing, feeling, and understanding as there are members. In a group we come to understand that we can learn from another's experience and perspective. We also become aware of our own and other's bias and lack of understanding through the process the group. We see that sometimes people do not know how to take or use real innovation and that many times people do not know how to recognize the real teachers or the real lessons. We see that a community can reinforce an important teaching or pose obstacles to realizing its true message. It is not until, as the Tohono O'odham phrase it, "when all the people see the light shining at the same time and in the same way" that a group can truly progress on the path of knowledge.

Finally, these are precepts which have been generalized to form a conceptual frame around which approaches to Indigenizing contemporary education may be viewed. The precepts form an ethical/methodological *context* for thought and consideration through which curriculum may be created around an Indigenous epistemology grounded in the ecological and ethical orientations of different Indigenous groups. Each group's curriculum will necessarily evolve based on their history, needs, aspirations, and vision of a contemporary education for their people. These expressions of education will vary and differ according to circumstances but, at another level, will resemble one another in many ways. This resemblance is because Indigenous peoples' epistemological orientations and worldview tend to be more similar than dissimilar. The other reason is that the contemporary Indigenous focus on education and the sentiment toward "decolonization" is rooted in similar issues that have formed their social consciousness through the colonial, modern, and postmodern eras. For insight into why these similar issues and expressions of social consciousness exist, I turn now to the work of Paulo Freire who learned about *Indigenous* forms of social consciousness and community through his literacy advocacy and activist work with the urban and peasant workers' unions of Brazil.

Social Consciousness and Indigenous Education

Paulo Freire, Brazilian social reformer and educator, introduces a notion of education which closely parallels the role of Indigenous education in the transformation of the social consciousness of Indigenous peoples as they strive to “self-determine” themselves in the face of the challenges of a twenty-first-century world (Paulo Freire 1970). While there are other Western social philosophers such as John Dewey who have espoused a different view of how education can be approached, it is the praxis of Freire that speaks most profoundly to the circumstances and yearnings of many Indigenous peoples.

Freire’s thesis is founded on the notion that critical consciousness of cultural and historical roots of a people – as expressed and understood from the perspective the people themselves – is the foundation of a people’s cultural emancipation. The modern struggle of Indigenous peoples throughout the world has largely been characterized by an attempt to maintain the most cherished aspects of their ways of life, their relationship to their lands, and their consciousness of themselves as a distinct people. They are constantly engaged in a dynamic struggle to retain “the freedom to be who they are” in the midst of subtle and at times overt oppression by modern societies.

Freire’s central message about education is that one can only learn and understand to the extent that one can establish a direct and participatory relationship with the natural, cultural, and historical reality in which one lives. This is not the same as the Western-schooled authoritarian style of problem-solving, where schooled “experts” observe a reality or situation from the outside and at a distance and then develop a solution or dictate an action or policy. This approach decontextualizes the problem from the totality of human experience and leads to a distorted perspective of the problem as an event that has relationship only to itself and to nothing else. This form of ultra-objectification denies the reality of interrelationship and reduces participation and learning to only an intellectual exercise of applying a preconceived objective method or model. The result is a perpetuation of dependence on an “outside” authority and the maintenance of the political power brokers behind such authority. Indigenous people who are “administered” education, extension services, and economic development in these terms usually remain oppressed and gradually become dependent on the “authority.” Under these circumstances, Indigenous peoples’ ability to revitalize and maintain themselves culturally, socially, and economically through a self-determined process of education is significantly diminished, if not outright destroyed.

Freire’s approach is to begin with the way a group communicates about their world and their experiences in their social contexts. Then “generative” words, metaphors, or proverbs are identified which evoke thought and feelings or reveal a historical perspective that has intrinsic meaning to a people and their cultural way of life. These words or phrases are then translated into a variety of meaningful images and discussed with the people themselves to “unpack” their meaning. This process evolves through various stages of dialogue through structures called “culture circles.” In the “culture circle,” a group reflects on key generative words and symbols facilitated by a coordinator who helps form the dialogue. Since the words and symbols being used come from the language, cultural, or historical experience of the group, the people

begin to reflect on their own collective stories in ways that stimulate new insights about themselves, their situations, and solutions to problems which they face. Motivation, meaning, and “researching” of their cultural roots for possible models for viewing their problems are built into the “culture circle.” The group learns by telling and retelling their stories, reflecting on their meaning, and reinforcing the vital elements of their cultural orientation. This process of learning stimulates the thinking of “people submerged in a culture of silence to emerge as conscious makers of their own cultures.” The group learns how to create new meanings and apply insights derived directly from their own culture, history, and social experience to their contemporary life. What they learn about themselves through themselves forms the basis for authentic empowerment and the beginning of release from imposed authority through a process of education that has become their own. Through such a process, the group can truly cease being “objects” for outside political, economic, or educative manipulation. Instead, they become subjects in the making of their own stories for the future and controllers of their own destiny.

Freire’s method has had a profound effect on increasing the literacy and the social consciousness of not only rural peoples in Brazil, but millions of people in third-world nations. It works primarily because it acts to release what is essentially an Indigenous response to learning by fostering relevant dialogue about what is important to people in contexts of social and political situations which directly affect them. Relevancy of what is being learned and why it is being learned becomes readily apparent because it is connected to the cultural orientations as the people themselves perceive them. The democratization of knowledge and the educational process perpetuated by Freire’s approach mirrors that which occurs in Indigenous education. A new relationship between Indigenous people and modern education and knowledge bases is made possible. The knowledge and educational orientation of modern educators is changed from an expert-recipient relationship to one of mutually reciprocal learning and co-creation. What is established is essentially a more ecologically sound and sustainable process of education. A kind of education is engendered which frees teachers, learners, and community to become partners in a mutual learning and becoming process.

Freire’s method mirrors, at a social level, the ecologically inspired orientation of Indigenous education which I have called “natural democracy.” There is a direct communication between all individuals engaged in the educative process. The implicit paternalism, social control, and nonreciprocal orientation between experts and recipients of education give way to authentic dialogue which generates a high level of critical consciousness and the kind of educational empowerment that allows Indigenous people to become agents of transformation in their own social and cultural contexts.

Countering Indigenous Histories of Colonization

The histories of Indigenous education have largely been characterized by colonization and policies of assimilation combined with covert attempts at modernization of Indigenous communities to “fit” them into the mainstream profile of contemporary

Western society. This has been, for the most part, a technical process of development, combined with intense indoctrination in the political and bureaucratic ways of the Western government. Educational development, like other extensions of “development aid,” has occurred through the actions of technicians, bureaucrats, and political manipulators who many times have acted to keep real decision-making power outside the parameters of the Indigenous communities and individuals affected. Many educators, social reformers, bureaucrats, businessmen, and politicians continue to perpetuate governmental and mainstream paradigms either because they have never questioned their own educational conditioning within this system or because they have not found or explored alternatives. This situation has largely prevented Indigenous people from being the subject and beneficiaries of the exploration of their own transformative vision and educational process. As a result, many Indigenous people are still relegated to having to “react” to the administration of their lives and education because of continued dependence on government aid and extension services. Rather than being “proactive” and truly self-determined in their efforts to *educate themselves through themselves*, many Indigenous people continue to struggle with modern educational structures which are not of their own making and are separated from, and largely compete with, their traditional forms of education. There continues to be a kind of educational “schizophrenia” in the reality of Indigenous education as it exists today. As a result, Indigenous people continue to be one of the most educationally disadvantaged and “at risk” minorities in the world. This reality exists in spite of the histories of many enormously profound and elegant expressions of traditional education and philosophy that this chapter has outlined. An essential question is: what needs to happen to reclaim and rename this enormously important heritage not only for Indigenous people but as a contribution to the educational development of all future generations?

The basis of contemporary Western education is the transfer of academic skills and content which prepares the student to compete in the social, economic, and organizational infrastructure of Western society as it has been defined by the prevailing political, social, and economic order of vested interests. However, the ideal curriculum espoused by Western education ends up being significantly different from the experienced curriculum internalized by students and the real workings of much of society. The society which many minority students experience is wrought with contradictions, prejudice, hypocrisy, narcissism, and political and bureaucratic predispositions at all levels including the schools. As a result, there have been educational conflicts, frustration, and varying levels of alienation experienced by many Indigenous peoples as a result of their encounters with mainstream education.

Traditional Indigenous education represents an anomaly for the prevailing theory and methodology of Western education since what is implied in the application of “objectivism” based on a Western worldview is the assumption that there are one correct way of understanding the dynamics of education, one correct methodology, and one way of understanding the reality of educational philosophy and that there can be only one correct policy for Indigenous education. This approach excludes serious consideration of the “relational” and experienced reality of Indigenous people, the variations in Tribal and social contexts, and the processes of perception

and understanding which characterize and actually form its expressions. This has substantial limitations in the multidimensional, holistic, and relational reality of the education of Indigenous people. It is the affective elements – the subjective experience and observations, the communal relationships, the artistic and mythical dimensions, the ritual and ceremony, the sacred ecology, and the psychological and spiritual orientations – which have characterized and formed Indigenous education since time immemorial. These dimensions and their inherent meanings are not readily quantifiable, observable, or easily verbalized and, as a result, have been given little credence in mainstream approaches to education and research. Yet, it is these very aspects which form a profound orientation for learning through exploring and understanding the multidimensional relationships between humans and their inner and outer worlds.

For Indigenous educators, a key to dealing with the conflict between the objective and relational orientations, the social cultural bias, and the cultural differences in perception lies in the kind of open communication and creative dialogue which challenges the “tacit infrastructure” of ideas that guide contemporary education.

Education is essentially a communal social activity. Educational research which produces the most creatively productive insights involves communication within the whole educational community, not just the “authorities” recognized by mainstream educational interests. Education is a communication process and plays an essential role in every act of educational perception. There must be a “flow” of communication regarding the educational process among all educators as a result of internal dialogue, interactions among educators, publication, and discussion of ideas.

Many ideas based on the established “tacit infrastructure” of mainstream education have been embraced uncritically by educators. This situation, as it pertains to Indigenous education, limits creative acts of perception. A free play of thought and opening up of the field, which is not restricted by unconsciously determined assumptions, social pressures, and the inherent limitations of the currently established paradigms of contemporary education, needs to occur. It is only in realizing that there is a “tacit infrastructure” and then questioning it that a high level of creative thought regarding the possibilities and potentials of Indigenous educational philosophy can become possible. And only in realizing that Indigenous perceptions of education have traditionally been informed by a different “metaphor” of teaching and learning can more productive insights into contemporary Indigenous education be developed.

Traditional metaphors of education derived their meaning from unique cultural contexts and interactions with natural environments. Yet, many of these metaphors such as the notion of an interdependent, relational universe are held in common. In turn, the collective experience of Indigenous people and their elegant expressions of cultural adaptations have culminated in a body of shared metaphors and understandings regarding the nature of education and its “essential ecology.” The exploration of Indigenous education develops insights into the community of shared metaphors and understandings specific to Indigenous cultures yet reflective of the nature of human learning as a whole.

The next phase of the development of Indigenous education requires the collective development of transformative vision and educational process based on deep relevant dialogue. This kind of development requires that “new structures” and “practices” emerge from old ones through a collective process of creative thought and research. These kinds of new structures and practices can only be generated by an ongoing and unbiased process of critical exchange between modern educational thought and practice and the traditional philosophy and orientations of Indigenous people.

A new kind of educational consciousness, an “ecology of Indigenous education,” must be forged which allows Indigenous peoples to explore and express their collective heritage in education and to make the kinds of contributions to global education that stem from such deep ecological orientations. The exploration of traditional Indian education and its projection into a contemporary context is much more than just an academic exercise. It illuminates the true nature of the ecological connection of human learning and helps to liberate the experience of being human and being related at all its levels.

From this perspective, education takes on the quality of a social and political struggle to open up the possibilities for a way of education that comes from the very “soul” of Indigenous people. It also brings to the surface the extent and the various dimensions of the conditioning of modern educational processes that have been “introjected” into the deepest levels of their consciousness. They become critical observers of the modern education to which they have had to adapt and which demands conformity to a certain way of education that more often than not has been manipulated to serve only certain “vested interests” of Western society. Through the exploration of Indigenous education, they learn how to demystify the techniques and orientations of modern education. This understanding allows them to use such education in accord with their needs and combine the best that it has to offer with that of Indigenous orientations and knowledge. They cease to be “recipients” of modern education and become active participants and creators of their own education.

Indigenous Teaching and Learning Orientations

Idries Shah (1978) in his book *Learning How to Learn* illuminates some of the most important elements of Indigenous teaching and learning which revolve around “learning how to learn” which is more similar to the tenants of lifelong learning than simply the mechanics of teaching and quantitative assessment of learning. Learning how to learn is a key element in every approach to education. Therefore, the cultivation of the human capacities for listening, observation, experiencing with all one’s senses, development of intuitive understanding, and respect for time-tested traditions of learning naturally formed the basis for skills used in every process of Indigenous learning and teaching.

Indigenous peoples in both North and South America, New Zealand, Australia, Africa, Asia, the Pacific, Greenland, and Northern Europe developed a diverse

variety of approaches to teaching and learning. These approaches ranged from the loosely organized informal contexts for learning and teaching in hunter-gatherer tribes to the formally organized “academies” of the Aztecs, Maya, Inca, and other groups of Mexico and Central and South America. Whatever the approach, there was a continuum of education in Tribal American societies which involved an array of ritual/initiatory practices that closely followed the human phases of maturation and development. In each phase of this continuum, an important aspect of learning how to learn was internalized. Learning how to learn in Tribal societies may be seen to unfold around the following four basic areas of orientation.

First is the attention to real and practical needs of the Tribal society which systematically addressed learning related to physical, social, psychological, and spiritual needs of Tribal members, the most important of which were learning how to survive in the natural environment and learning how to be a productive member of the Tribal society.

Second is the teaching of individuals in individual ways when they showed the readiness or expressed the willingness to learn. The emphasis was on allowing for the uniqueness of individual learning styles and encouraging the development of self-reliance and self-determination.

Third is the application of special intellectual, ritual, psychological, and spiritual “teaching tools” which facilitated deep levels of learning and understanding. Indigenous teaching was throughout predicated upon three basic criteria: flexibility, viability, and effectiveness.

Fourth is the honoring and facilitation of the psychological and transformational process of “flowering” or opening up to a self-knowledge and natural capacities of learning. This was usually accomplished by helping individuals overcome their own self-generated impediments to learning and other obstacles to understanding.

The list of Indigenous axioms of teaching which follows represents a small portion of the storehouse of wisdom and creative approaches to teaching applied by Tribal teachers from throughout the world in creating an educational process that reflected a sophisticated culturally inspired “ecology of education.” Indigenous education allowed for such a diversity of sophisticated teaching “tools” that few modern educational approaches are able to duplicate in breadth and creativity. These interpretations of Indigenous teaching axioms are derived from a host of readings and observations related to Indigenous education. They are presented in a simplified form with a minimum of description in the hope that teachers will apply their own creative interpretations and implementations based the development of their own lessons and curricula. As processes, these axioms are applicable to the holistic presentation of any kind of content and adaptable to every age level and appear in many cultural traditions of teaching.

1. Tribal teachers begin teaching by building on the commonplace. We have common experiences, understandings, and human traits that can be used to pose a problem in terms, forms, or experiences that are familiar to students.

2. Remember that learning is a natural instinct and that success in learning something new is tied to human feelings of self-worth. Create a learning environment which flows with this natural current of humanness. Enabling successful learning is an essential step in cultivating motivation and enhancing self-confidence in learning.
3. Basic understanding begins with exploring “how things happen.” Observing how things happened in the natural world is the basis of some of the most ancient and spiritually profound teachings of Indigenous cultures. Nature is the first teacher and model of process. Learning how to see Nature enhances our capacity to see other things.
4. The focus of a teaching on a perennial phenomenon, such as solar and lunar cycles, stimulates the deepest level of “learning how to learn” and the development of self-knowledge.
5. Indigenous teaching focused as much on learning with the “heart” on learning with the mind. This was the pervasive affective dimension of Indigenous teaching and learning.
6. Indigenous teaching facilitated learning to see how one really was rather than an image manufactured through one’s or other’s egos. This realistic perception of self helped the student realize that they were essentially responsible for the barriers to their own learning.
7. The real situation provided the basic stage for most Indigenous learning and teaching. Overt intellectualization was kept to a minimum in favor of direct experience and learning by doing. Teaching through a real situation expanded the realm of learning beyond speculation and allowed the student to judge the truth of a teaching for themselves.
8. Readiness to learn was considered a basic determinant for the ultimate success or failure of a teaching. Indigenous teachers recognized that readiness for learning important things had to be conditioned for through repetition and the relative “attunement” of the student to the teaching. They watched for “moments of teach ability” and repeated the teaching of key principles in numerous ways and at various times.
9. Placing students in situations in which they constantly had to examine assumptions and confront preconceived notions was a regular practice of Indigenous teachers. Through facilitating this kind of constant examination of what students “thought they knew,” they remained open to new dimensions of learning and prepared for higher levels of thinking and creative synthesis.
10. Indigenous teaching is always associated with “organic development.” Indigenous teaching is planted like a seed and then nurtured and cultivated through the relationship of teacher and student until it bears fruit. The nature and quality of the relationship and perseverance through time determined the ultimate outcome of a teaching process. Apprenticeship and learning through ritual stages of learning readiness were predicated on the planting of seeds and nurturing the growing seedling through time.
11. Teaching is a communicative art. Indigenous teaching is based on the nature and quality of communicating at all levels of being. Indigenous teachers practiced

the “art” of communicating through language, relationship to social and natural environments, art, play, and ritual.

12. Teaching and learning is a matter of serving and being served. Service is the basis of the relationship between student and teacher. This foundation was exemplified most completely in the apprentice-teacher relationships found in all expressions of Indigenous education.
13. Indigenous teaching involved making students think “comprehensively” and facilitating their awareness of the higher levels of the content which they were learning and its relationship to other areas of knowledge. Such comprehensive thinking formed a firm foundation for the creative process of teaching and learning. That is, comprehensive preparation and immersion in a learning process invites new understandings and perceptions of dimensions of knowledge that are there all the time but need to be worked before they reveal themselves.
14. Indigenous practices such as creative dreaming, art, ritual, and ceremony helped the student externalize inner thoughts and qualities for examination. Such practices helped students to establish a connection with their “real” selves and learn how to bring their inner resources to bear in their lives. Helping students gain access to their real selves was part of the “transformative” education which was an inherent part of Indigenous teaching.
15. Indigenous teaching revolved around some form of work. Indigenous teachers recognized that work invites concentration and facilitates a quietness of the mind which in turn leads to illuminating insights about what is being taught.
16. Tribal teachers understood that all teaching is relative and that each path of knowledge had its own requirements which needed to be addressed. Flexibility and learning how to adjust to the demands of the moment were key skills that were cultivated throughout Indigenous education.
17. Learning about the nature of self-deception was a key aspect of Indigenous preparation for learning. A first step in understanding the nature of true learning was reaching a level of clarity regarding why one was learning. Students had to become aware that ambition, self-gratification, power, and control as purposes for learning were forms of self-deception which had to be avoided because they lead eventually to the misuse of knowledge and the further perpetuation of self-deception.
18. Tribal teachers realized that striving for real knowledge required a cultivated sense of humility. The human tendencies toward pride, arrogance, and ego inflation had to be understood and avoided in the search to find one’s true “face,” “heart,” and “vocation.”
19. Mirroring consequences of a teaching back to students in order to expand their perspective and deepen their learning was often used in Indigenous education. Tribal teachers facilitated learning through direct, and at times provoked, perception by setting up a situation which forced students to see the limitations of what they thought they knew. In this way, students were encouraged to reach deeper into themselves and realize the deeper levels of meaning represented by a

- teaching. This practice helped students cultivate a degree of humility necessary for maintaining an openness to new learning and the creative possibilities of a teaching.
20. The cultivation of humility correspondingly prepared a foundation for the students learning the nature of “attention.” Attention may be considered a foundation of Indigenous learning in that almost every context, from learning basic hunting and fishing skills to memorizing the details of ritual, to listening to story, and to mastering a traditional art form, relied on its practiced application. Attention in the Indigenous sense had to do with the focus of all the senses. Seeing, listening, feeling, smelling, hearing, and intuiting are the senses which were developed and applied in the Indigenous perspective of “attention.”
 21. Learning the nature of appropriate activity was a natural consideration of Indigenous teaching. Activity in Indigenous life always had a purpose. “Busy work” was not a concept Tribal teachers were interested in perpetuating, since helping students learn how to engage in effective activity appropriate to the situation at hand was a basic skill required for more advanced Indigenous teaching.
 22. Knowledge and action were considered parts of the same whole. Properly contexted and developed knowledge led to the same balance in terms of action. Therefore, in order to assure the integrity and relative “rightness” of an action, a great amount of time was spent on reflection and seeking broad levels of information and understanding before forming an opinion or taking an action. Prayer, deep reflection, patience, and “waiting for the second thought” were regularly practiced in Indigenous decision-making.
 23. A concept of “each person’s work,” akin to the Hindu concept of “karma,” was honored in the processes of Indigenous education. Indigenous teachers saw that each student was unique and had a unique path of learning which they needed to travel during their life. Learning the nature of that path was many times the focus of Indigenous rites of initiation and vision questing. The trials, tribulations, and “work” that become a part of each individual’s learning path constituted the basis for some of the most important contexts of Indigenous teaching and learning.
 24. From the Indigenous perspective, true learning and the gaining of significant knowledge did not come without sacrifice and at times “a deep wound.” Indigenous teachers realized that, at times, only by experiencing extreme hardship and trauma were some individuals ready to reach their maximum level of learning development. The ritual incorporation of this reality of life’s hardships into such ceremonies as the sun dance transforms the reality of wounding into a context for learning and reflection. In this way, the wound or traumatic life event was mobilized to serve as a constant reminder of an important teaching. As long as the wound or the repercussions of an event were used to symbolize something deeply important to know and understand, they provided a powerful source for renewal, insight, and the expansion of individual consciousness.

Conclusion

In summary, a primary orientation of many traditional forms of Indigenous education was that each person was in reality their own teacher and that learning was connected to each individual's life process. Meaning was looked for in everything, especially in the workings of the natural world. All things of nature were teachers of mankind, and what was required was a cultivated and practiced openness to the lessons which the world had to teach. Ritual, mythology, and the art of storytelling combined with the cultivation of relationship to one's inner self, family, community, and natural environment were utilized to help individuals realize their potential for learning and a complete life. Individuals were enabled to reach "completeness" by being encouraged to learning how to trust their natural instincts, to listen, to look, to create, to reflect and see things deeply, to understand and apply their intuitive intelligence, and to recognize and honor the teacher of spirit within themselves and the natural world. This is the educational legacy of Indigenous peoples. It is imperative that its message and its way of educating be revitalized "for life's sake" at this time of ecological and social crisis (Cajete 1994).

At a more inclusive level, exploration of Indigenous education liberates the learner and educator to participate in the kind of creative and transforming dialogue that is inherently based on equality and mutual reciprocity. This is a way of learning, communicating, and working of relationship that mirrors those ways found in nature. It also destigmatizes the Indigenous learner as being "disadvantaged" and the educator of the "provider of aid." Rather, it allows both the learner and educator to co-create a learning experience and mutually undertake a pilgrimage to a new level of self-knowledge. The educator enters the "cultural universe" of the learner and no longer remains an outside authority. By being allowed to co-create a learning experience, everyone involved generates a kind of critical consciousness and enters into a process of empowering one another. And with such empowerment, Indigenous people become significantly "enabled" to alter a negative relationship with their learning process. Ultimately, with the reassertion, contemporary development, and implementation of such an Indigenous process at all levels of Indigenous education, Indigenous people may truly take control of their own history by becoming the transforming agents of their own social reality.

In the final analysis, Indigenous people must determine the future of Indigenous education. That future must be rooted in a transformational revitalization of our own expressions of education. As we collectively *envision Indigenous education*, we must think of the seventh generation of Indigenous children for it is they who judge whether we were as true to our responsibility to them as our relatives were for us seven generations before. It is time for an authentic dialogue to begin to collectively explore where we have been, where we are now, and where we need to go as we collectively embark on our continuing journey "to that place that Indigenous people talk about." I hope that these thoughts will stimulate that kind of dialogue.

Abstract

Changing demographic patterns around the world are posing new challenges to the constructions of being, belonging, and identity, demanding a deeper insight into the dynamics that test the resolve of people to coexist more amicably. For school communities this means adopting a stance that positions students and teachers within a safe and enabling educational environment. How disciplinary protocols are embedded and enacted within these environments is critical to how coexistence is manifested. Very often authoritarian disciplinary sanctions are operationalized with spontaneity and are seen as a preferred “quick fix” for student behaviors that are deemed unacceptable. However, a growing body of evidence indicates that such courses of action can seriously hamper, rather than improve, a student’s sense of being, belonging, and identity – by negatively impacting on their attitude, behavior, and performance. These long-term ramifications appear to be experienced in disproportionate numbers by students who are from minoritized ethnic groups and who may interpret these misconceptions as rejection of themselves or their ethnic group, often creating a self-fulfilling belief that their membership belongs somewhere else. Drawing on findings from three research projects located in three different parts of the world, this chapter describes how restorative responses to challenging behavior, when instantiated skillfully and with integrity, have the potential to bring about positive life-course changes. Common themes that underscore an approach that is used in all three settings are highlighted, linking several underlying constructs back to the key theoretical frameworks which inform them. The chapter ultimately illustrates how these frameworks have been actualized in school and community settings and points to Indigenous insights as being key determinants that drive the measures that are built into these frameworks. It is proposed that conventional approaches to responding to challenging behaviors regularly fail to meet the relational needs of learning and teaching in twenty-first-century schools. Increasingly, schools are searching for alternatives that work. To that end, they are finding restorative approaches more effective in establishing long-term, lasting changes in relationships, more connectivity among members of a school community, more inclusiveness of a range of voices, and more enhancement of ethics of care within school communities as a whole. Responding to these opportunities requires educators to reach beyond the auspices of conventional education protocols, toward more innovative perspectives that promote broader social justice and

equity within policies and practices. This chapter illustrates synergies across different geographic and cultural locations and brings attention to particular pedagogical practices which, even in widely diverse settings, are collectively associated with positive outcomes.

Introduction

Globally, the speed and scale of social, political, technological, and cultural change poses a wide array of challenges (and opportunities) to educational practice in the twenty-first century. Engaging with the current pace of change requires educators to have an awareness of the national and international concerns that set the context for considering alternative and diverse approaches to learning and teaching. Shifts in societal patterns, cultural diversity discourses, and the tangibility of challenging behaviors have sparked new questions about inclusion and differentiation. Peaceful human coexistence continues to be a global aspiration but conflict, in a variety of forms, appears to have increased in recent years. Education settings covering the spectrum from birth to adolescence, while being places of value-building activities, appear to be increasingly a microcosm reflecting the aspirations, dysfunctions, and conflicts that manifest in communities and societies beyond. Additionally, many traditional educational practices are still lingering; practices that focus on delivering specific cognitively developmental and standards-assessed curricula which continue to promote levels of disparity, despair, and disengagement for many ethnic minorities. These consequences fuel a further fragmentation within communities. Changing demographic patterns around the world are posing new challenges to the constructions of belonging, being, and cultural identity, and demand a deeper insight into the various forms of relationships that need to exist between people (Macfarlane 2012). These changing patterns also present opportunities for innovation and envisioning.

The diverse range of twenty first-century challenges impels educators (researchers and practitioners alike) to find new ways of “doing school” in order for education to be the empowering, effective, and equitable force for reimagining people’s future. Interestingly, effectiveness and equity are often achieved by going back to traditional ways (in earlier times) of “doing school,” and this frequently means turning toward, and drawing from, Indigenous epistemologies. Effective education in the here and now appears to require an ecological and sociocultural positioning approach; one that facilitates and focuses on the essential holistic skills for wellbeing and social cohesion. Educators across the globe wishing to reposition to a more holistic pedagogy have a plethora of traditional and emerging theories to consider. They also have to assess the appropriateness and fit to their particular geographic, historical, and cultural

environment, while considering how a theoretical approach would actually be made real at their respective sites of learning and teaching.

Paradoxically, the global stage, wherein the educational challenges and opportunities reside, is also the context from which answers can and do emerge. Nieto Ángel and her colleagues have previously published in a Spanish language journal (Nieto Ángel et al. 2015) on two (Latin America and Aotearoa New Zealand) of the three projects that are discussed in this chapter, and they have highlighted successful holistic, Indigenous-embedded approaches to reimagining education. This chapter adds a third project (United States), thus enabling assessment of pilot approaches across sites in three continents. This chapter highlights the synergies that exist across three different geographic and cultural locations and draws attention to particular pedagogical practices which, even in widely diverse settings, are collectively associated with positive outcomes.

The diversity of settings includes the differing scale of research projects. Two projects were single school sites, a rural school in Aotearoa, New Zealand, and an urban school in the United States. The third project was large-scale and multisite, engaging with seven schools in five Latin American countries. Across these distinct differences, the commonalities in pedagogical practice and outcomes attract attention.

Drawing on a triangulated viewpoint to assess common challenges in diverse geographical settings, this chapter describes how effective responses, when instantiated authentically and with integrity, have the potential to bring about positive change. The chapter highlights common themes and approaches used in all three settings and links the underlying constructs back to the key theoretical frameworks which have informed them. The discussion ultimately illustrates how a cluster of theoretical frameworks has been actualized in school and community settings. Some of the conclusions point to emerging constructs and practices that have been associated with improved outcomes in these three distinctly diverse settings. These key constructs are offered as a means of assisting researchers, school leaders, and teachers in identifying approaches which may be consistently linked to improved educational outcomes. Specifically, the conclusions suggest that there is a need for more focus on relationships and access to holistic approaches for responding to wrongdoing, resolving conflicts, and restoring harmony within relationships in school communities. It is argued that these focus areas have resonance with traditional, Indigenous approaches. Traditional, Indigenous contentions are the *tapuwae* (footprints) upon which much of the thinking and theorizing relating to the three research sites reported on in this chapter are traced.

Ngā Tapuwae ō Mua: Footprints of the Past

There is a substantial body of literature on Indigenous Māori approaches to responding to social harm (see Cherrington 2009; Fergusson et al. 2014). The two key general premises are that: (1) systemic inequality, discrimination, dispossession, destitution, over-policing, and imposed cultural genocide are responsible for

imbalance, anger, and violence in communities and between individuals (e.g., see Durie 2007; Jackson 1988); and (2) an holistic approach is necessary to balance relationships and heal the colonial trauma that affects Indigenous (and non-Indigenous) peoples (e.g., see Durie 2003; Macfarlane et al. 2008). These two premises indicate that the explanations and solutions proposed are: systemic and holistic (rather than reductionist) (e.g., see Durie 1994), collectivist (rather than individuated) (e.g., see Rangihau 1975), and relational, which implies that the focus is not on individual thinking or behavior, but on existential, social, and cultural aspects related to connections with others and with the environment (e.g., Bateman and Berryman 2008; Reedy 1992). These understandings point to alternative strategies of prevention, intervention, and redirection of unacceptable behaviors.

The traditional Māori discipline model has four broad principles: consensus, reconciliation, examination, and restoration. These elements are critical to an effective outcome (Macfarlane, cited in Fraser et al. 2005). These four quintessential features illustrating traditional Māori discipline were also identified more recently by McElrea (1994) and Olsen, Maxwell and Morris (1995). These are:

- An emphasis upon reaching consensus and involving the whole community
- A desired outcome of reconciliation and a settlement acceptable to all parties rather than the isolation and punishment of the offender
- Not to apportion blame but to examine the wider reason for the wrong with an implicit assumption that there was often wrong on both sides and
- Less concern with whether or not there had been a breach of protocol or law, and more concern with the restoration of harmony

The use of what Māori refer to as *whakatika* (putting matters to right) to achieve satisfactory restoration via the model outlined above is implicit for Māori and many other Indigenous peoples. Their traditional societies “had this down to a fine art” and many examples are manifested magnificently in mythology, legends, and history. Contemporary Māori society, for instance, has retained an abundance of what *tipuna* (ancestors) had to offer, and this wisdom has guided much of the researchers’ deliberations in the three research contexts.

Framing the Three Contexts

The three research projects are geographically and culturally diverse, and each employed a contextually specific research design. In Latin America, the project was large-scale and multisite, involving approximately 7000 students in five countries. This project was designed to provide teachers with methodologies of care, while giving schools the capacity to transform their institutional culture, leading to enhanced social cohesion and more effective educational outcomes. The Aotearoa New Zealand project was a single school site, at a small rural school. The focus was on how the school community could create *manaakitanga* (the ethic of caring) in the school environment. The United States project was also a single school site but was

based in a large urban school. The purpose of this project was to learn how to change a school culture, which used punitive processes for discipline, into one where care prevailed. In the Aotearoa New Zealand and United States sites, there was a focus on culturally minoritized students. Additionally, in Aotearoa New Zealand, use of traditional Indigenous knowledge was a key element in the change process. Each of the projects achieved success with their objectives and, when the projects were compared, it became apparent that common themes resonated across the differing contexts. In presenting the research findings, this chapter explores the common preexisting challenges which the projects' aims sought to address, and offers a commentary of the respective constructs that underpinned positive change for participating schools and communities.

Recurring Challenges

Given the breadth of historic, cultural, and structural differences between Latin America, Aotearoa New Zealand, and the United States, it would be reasonable to anticipate a wide variety of educational challenges presenting across the three research sites. The data stories, however, revealed that impressively similar problems were faced by the schools in all of the settings. Specifically, conflict and contraventions within school settings were common issues, as were diminished opportunities for learning resulting from school discipline processes. Two other important factors were brought to the fore: achieving positive connections between the schools and local communities; and the focus of education on academic curriculum at the expense of social, relational, and emotional skill-building.

In the Latin American context, schools reported regulatory breaches among peers and vandalism toward property, which linked with student disengagement and drop-out recurrences – often culminating in a familiar cycle of segregation and delinquency (Martínez-Otero Pérez 2005). Additionally, a punitive approach to misbehavior often led to the exclusion of students from school, thereby decreasing opportunities and increasing vulnerability. The Aotearoa New Zealand context showed disruptive behavior was on the rise. Of further concern was the overrepresentation of Indigenous and minority cultures in data on students excluded from schools due to behavioral issues (Cavanagh et al. 2012). In the United States research site, wrongdoing and conflict at school were seen as a “pipeline to prison,” particularly for Latino/Hispanic students. Similar to the other two contexts, referrals for discipline resulted in detentions, suspensions, and expulsions and led to school drop-out (Cavanagh et al. 2014). At the commencement of all three projects, discipline procedures in participating schools tended to not include processes for restoring relationships and valuing the dignity of all individuals.

While there is a recognition of education as a responsibility of the whole society, Latin American schools have experienced difficulty integrating their local community and linking families to the school while also respecting and valuing the cultural and socioeconomic diversity these families represent. This subsequently impairs student development of knowledge and skills for broader participation in their

communities and society (Reimers 2008). At the Aotearoa New Zealand rural school of interest, Māori students comprised 45% of enrollments, which was well above the national average. The lack of culture integrated within classroom content was illustrated when a student indicated that the once-a-week school kapa haka practice (Māori arts performance) was the only element that connected being Māori with school life (Cavanagh 2009b). At the United States urban school, over 60% of the students identified themselves as Latino/Hispanic. The research project showed that the expectations and needs of the Latino/Hispanic parents and students were not reflected in the students' typical experiences at school.

All three sites tended to place emphasis on academic curriculum, ahead of social, relational, and emotional skill-building. The prevailing focus of education in Latin America was for employment, which did not encourage the holistic development of students (UNESCO 2007). Overall, it appeared that socioemotional and relationship skills had a secondary place in the school curriculum. In the Aotearoa New Zealand rural school, prior to institutionalizing the changes that are described below, learning was prioritized and care of the student as a person with a specific cultural identity was a secondary consideration. The priorities of the United States urban site were reflected in discipline procedures that excluded students from the learning environment and did not seek to restore relationships when these were harmed. Integral to the emphasis on specifically cognitive curriculum was the absence of an ethic of care (Noddings 1992) and this in turn was an impediment for culturally responsive pedagogy (Macfarlane 2007) to transpire. A further characteristic at the commencement across all of the research sites was that, while schools had procedures for attending to discipline matters, none appeared to be using restorative processes for enabling the development of peace-making and conflict-resolution skills.

Having noted three of the common challenges across the Latin American, United States, and Aotearoa New Zealand sites, the next section illustrates the diversity of the three projects while describing methodologies, processes, and results for each research project.

Latin America: Care at the Core

Over recent decades, Latin American schools have faced serious challenges related to creating spaces for inclusion, where people learn to live with others while also attaining academic success (Cabrol and Szekely 2012). As indicated above, schools have reported problems related to vandalism, aggression, lack of motivation, and, ultimately, dropping out of school. Also, schools had environments of tension between teachers and between teachers and administrators (Martínez-Otero Pérez 2005). Schools have struggled to integrate their local communities and make links with families while also respecting and valuing the cultural and socioeconomic diversity these families represent. In addition, where schools are weakened by an internal environment of conflict, their ability to respond appropriately to wrongdoing and conflict is compromised. As a result, students fail to develop the knowledge and

skills to be able to participate in a positive way in the economic, political, and cultural life of their communities and country (Alfonso et al. 2012; Bos et al. 2012).

Methodologies

The objective of the Pedagogies of Care and Reconciliation project (PCR) was to improve relationships among people in schools and understand how this can influence learning and improve educational quality. The conceptual and methodological frameworks for the work of PCR were based on three theoretical pillars: (1) the cultural politics of forgiveness and reconciliation (Narváez 2009), (2) the ethics of care (Cavanagh et al. 2012; Commins 2009; Noddings 2004), and (3) socioemotional education (Bradberry and Greaves 2009). The use of participatory action research (PAR) (Fals Borda 2001) was an appropriate methodology for achieving the PCR objective, particularly as the researchers proposed to build caring relationships with members of school communities as a model for how schools can strengthen their ability to transform systems, improve relationships, and increase the quality of education.

A prior intervention project by the PCR team led to the conclusion that at the root of social and school behavioral difficulties is a lack of care towards fellow humans and towards interpersonal relationships. At the time of this study, the prevailing focus of education in Latin America was for employment, and the ideal of providing holistic education had been abandoned in practice (Reimers 2008). The fundamental socioemotional skills of self-awareness and emotional self-regulation, and the ability to understand the emotions of others in relation to empathy had a secondary place in the school curriculum. While it was generally recognized that relationships between students and their teachers are a foundation for learning, little attention was paid to the development of communication and relationship skills in the training of pre-service and in-service teachers (Rodríguez-Ávila 2008; Tedesco and López 2013).

To test their initial conclusions regarding the role of relationships and care in education, the Foundation for Reconciliation developed a pilot project which was undertaken between 2011 and 2013. It included seven schools from five countries in Latin America, with a sample size of approximately 500 teachers and school administrators, and 7000 students.

The project used PAR methodology (Fals Borda 2001); however, each school community adapted and reconfigured the process to their local context. Two mutually reinforcing strategies were used: a whole-school intervention to change the existing institutional culture of participating schools and a program to develop the socioemotional skills of teachers so they could build better relationships with students and peers.

Part of the whole-school intervention was use of a tool entitled “Five Mirrors to Observe Ourselves and Dialogue” (Fundación para la Reconciliación 2012) to motivate dialogue in the school communities and gather emerging data. Activities associated with this tool provided opportunities for observing the everyday practices of teachers and students related to communication, participation, and regulation and

enabled the gaps between educational ideals of a holistic education and daily life at a school to be identified.

As part of the second strategy, all teachers were invited to participate in Schools of Forgiveness and Reconciliation (Escuelas de Perdón y Reconciliación, ESPERE) and socioemotional training sessions. Both processes share an experiential approach, with the aim of teachers making a narrative shift that allowed them to move from anger and resentment (ungrateful memory) to more compassionate attitudes. This, in turn, opens the way for building more positive and empathic relationships. Throughout the process, teachers were involved in dialogues to build a sense of meaning about the ongoing transformations, and they shared their personal and collective experiences through a virtual social network called “Youth Network for Reconciliation” (Red de Jóvenes por la Reconciliación).

During 24 months of the pilot, the Foundation for Reconciliation (the Foundation) worked alongside the schools, developing activities of socioemotional education, offering online support, and promoting school-community dialogues to build a sense of meaning.

Internal monitoring (Fundación para la Reconciliación 2014) and an external evaluation (Corporación Síntesis 2014) were used to assess the results in: the socioemotional competence of teachers, pedagogical style, institutional school culture, and educational quality. Insights, questions and accomplishments were shared with participating teachers by means of a further virtual social network – *Red para la Reconciliación* (www.perdonyreconciliacion.ning.com).

Data Stories

The Foundation accompanied school-facilitation teams in the analysis of findings. Information was collected in the form of interviews, questionnaires, observations, and use of a research game, “Five Pointed Star” (Nieto Ángel et al. 2013). This tool invited everyone in the school to indicate what they “like” and “dislike” about the school and enabled the whole community to learn about school climate. The answers were classified into five areas: school infrastructure, extracurricular activities, teachers, peers, and subjects.

Key findings showed that what students like are the teachers who care for them and who teach well. What the students like least are teachers who are disrespectful or intolerant, unfair punishment, peers mocking them in the classroom, and being labeled. Both students and teachers respectively perceive that their views are not taken into account during the process of deliberation and decision-making. Inconsistencies in the response to wrongdoing and conflicts were identified, and it was noted that staff, teachers, and students attributed different meanings to school rules.

Different voices within the school communities explained that interpersonal relationships are at the core of the quality of education. With regard to questions about the classroom environment and school climate, school community members typically referred to the communication patterns as well as relationships. A fifth-grade student said: “I don’t like it when teachers yell at me, because if I cannot

understand in class, I want them to explain things to me.” A second-grade student said what she likes about school is: “The teacher who helps me, who teaches me about sharing and being all together.”

Teachers spoke about the overloaded schedules and the number of administrative tasks. Moreover, teachers expressed frustration at not being able to put into practice the ideal of learner-centered education. When asked about the pedagogical model in school, a teacher said: “It is very good on paper, but to implement it consciously, to get familiarized with the child and have the opportunity to contextualize their life in the school, I need more time.”

Across the seven schools, participants enunciated the need to construct meaning about the essence and purpose of school regulations and benchmarks. This finding suggested that, in general, school regulations were not reflecting shared community values, which can be, in itself, the root of conflicts. One teacher stated that “There is not sufficient clarity about assessment parameters, one teacher thinks one way and another thinks different, and at the end children feel unfairly treated, and they are not engaged in school anymore.”

The in-depth observation of school life across five Latin American countries confirmed that schools found it challenging to be places of inclusion, where learning to live with others and achieving high academic standards are both possible. Despite debates related to “how” to achieve those purposes, it is commonly accepted that both educational objectives are valid and necessary: learning to live together and learning to learn. While most of these schools include the democratic ideals of education and student autonomy, they tend to systematically resort to punitive practices for handling wrongdoing and conflicts rather than implementing restorative justice options that are closer to the social ideal and an ethic of care. The use of punishment in response to behavior problems leads, in many cases, to the expulsion of students and eventually contributes to the antirestorative cycle of exclusion, vulnerability, and delinquency. Prior to PCR, none of the seven participating schools regularly used restorative justice practices; in fact, from the outset, several teachers expressed concern about the “blurred boundaries between care and permissiveness.”

Findings and Outcomes

Internal monitoring by the Foundation and external evaluation by Corporación Síntesis after 18 months of implementing PCR methodology in schools showed a range of positive outcomes (Fundación para la Reconciliación 2014).

Teachers had incorporated the language of care in their relationships with students and, when conflicts arose, both students and teachers were more willing to dialogue and restore relationships. A teacher who was asked to talk about caring practices with students answered, “Every morning students are received in the classroom with a gesture of affection, sharing lunch time with them, living, hearing their stories, and sharing mine too.”

Teachers had discovered the important role of emotions in education and made significant progress in personal self-awareness and self-regulation of their emotions. These new skills contributed to a positive classroom climate and better relationships

with colleagues and their own families. Additionally, the teachers experienced greater empathy with students and their unique ways of learning. Teachers observed that these changes had resulted in increased attendance and students being more collaborative with each other. One teacher remarked, “I reach out to my students because I want them to feel that I’m close to them, so if anyone is not coming to school, I would ask what happened, and they would know that we missed them.”

In light of the ideals of care and reconciliation, school teachers and administrators have continued to review their institutional culture and, in particular, the traditional school model based on “rights, duties, and punishments.” Participating schools are committed to introducing restorative practices and have put in place mechanisms to monitor the experience of teachers as they use new approaches. Dialogue to make meaning about these changes has fostered the construction of a new pedagogical identity.

An overall finding was that commitment to peaceful coexistence requires an understanding that although a caring environment might be endorsed, human interactions per se create care-less situations, breaches, and misunderstandings, which affect the dignity of people. Consequently, to make an ethic of care possible, the two key strategies of forgiveness and reconciliation are needed for restoring dignity and relationships.

When an ethic of care and reconciliation guides relationships across schools, a harmonious coexistence, conducive to effective education, is possible. Improving educational quality requires positioning care at the core. From that core, notions of care can be articulated across the whole school and be used to integrate what is often a clutter of fragmented school activities. Care at the core means a more organic and less segmented education.

Aotearoa New Zealand: Care Before Censure

Māori are the Indigenous people of Aotearoa New Zealand; a people who retain a rich knowledge base and worldview that has endured for many centuries within te ao Māori (the Māori world). In recent times, te ao Māori has been identified as a source of effective responses to address ongoing issues of inequity that perpetuate since European colonization.

In response to the arrival of European settlers to Aotearoa New Zealand, Māori signed a treaty with the British Crown (Treaty of Waitangi, 1840), based on the principles of partnership, protection, and participation. The Treaty promised to be the foundation for a bicultural nation. However, colonization practices, such as illegal land acquisition and cultural erosion of Indigenous people, created conflicts that are still focal in Aotearoa New Zealand. The result has been “the domination of Pākehā (European; non-Indigenous; new settlers) in political, social, and economic fields, the consequent marginalization of the Māori people” (Bishop and Glynn 1999, p. 50), and perpetuating problems of inequity.

Similar to the experience of other Indigenous peoples in the world, significant disparities emerged and continue to exist in socioeconomic indicators, including education. The academic performance of Māori students and minority cultures in Aotearoa New Zealand is lower than that of students from the majority Pākehā culture (Macfarlane et al. 2007). In addition, increasing levels of challenging and

disruptive behaviors at school are reported among culturally minoritized students. Recent decades have seen increased attention, from Māori and non-Māori alike, on drawing from Indigenous Māori knowledge and solutions to address these inequities. There is also greater recognition of the effectiveness of such approaches for students and teachers of Indigenous and non-Indigenous cultures (Smith 1997).

Methodologies

A single-site research study was undertaken in a rural area school (with primary and secondary students) in the North Island of Aotearoa New Zealand. PAR was chosen as a working methodology (Kemmis and McTaggart 1998) and work was grounded in a culturally responsive conceptual framework (Bishop and Glynn 1999; Smith 2005). These two approaches jointly underpinned development of the research study, including the research proposal, and the professional development training project. The overall project focused on understanding what the school community was doing to create a culture of care – based on the Māori concept of *manaakitanga*. A teacher described *manaakitanga* as “care and support for those who come to our family.”

At this research site, Māori students comprised 45% of enrollments, which was above the national average of 15%. The objective of the study was to legitimize the voices of Māori students and their teachers regarding the importance of building and maintaining relationships based on trust and caring relationships – expressed in Māori terms as *whakawhanaungatanga* (Bishop 2005; Macfarlane 2004) – and to restore relations when they had been affected by conflict and wrongdoing.

The PAR methodology provided a useful framework to achieve the defined objectives as it allowed Māori students and their teachers to elucidate problems related to their experience in school and make suggestions for improvement. Ultimately, the purpose was to gain an understanding about the phenomenon of interest from a Māori perspective. As a result, students and the school community assumed an informed position from which to respond to the social justice issues that were impacting learning.

Interviews, observations, and field notes, generated intensively throughout one school year and with less intensity over the three subsequent years, provided information that was analyzed from an appreciative inquiry (Patton 2003) perspective. This led to the formulation of a plan of work based on the strengths of the school community. The information collected was deconstructed into units of analysis for coding purposes and subsequently organized into themes according to the patterns observed in the codes.

Data Stories

Analysis of the data, using the process described above, clarified two key themes: *whakawhanaungatanga* (build and maintain relationships) and *manaakitanga* (extend holistic care). These themes subsequently provided the basis for describing the findings.

Whakawhanaungatanga (Build and Maintain Relationships).

Students at the school explained that interpersonal relationships with teachers directly impact their learning processes. They expect teachers' care and attention not only in learning (caring for the learning) but also as having a cultural location (caring for the person as a culturally located individual) (Valenzuela 1999). One student said, "With some teachers I learn and not others. With teachers that explain well and with whom I feel comfortable, yes, I learn."

The centrality of relationships to learning arose in the following sentence from a student: "What helps me learn is to have a good connection between the teacher and me." Another student explains this connection in terms of friendship: "I do not want to see my teacher only as a teacher, I also want him as a friend" (Cavanagh 2009b, p. 56). A key element in this teacher–student relationship is trust. As one teacher explained "Community is a safe and friendly environment where people live healthy relationships based on mutual care and support, a family atmosphere, a place where everyone knows each other and care about each other and their surroundings and where links between each and all things are created" (Cavanagh 2009b, p. 71).

These approaches enliven the whakawhanaungatanga concept, which is described in the literature as the sense of collective identity of a person that is grounded in partnerships established with their ancestors and their connection to the land (Macfarlane et al. 2014). Ultimately, building and preserving these relationships should be the core work of the school (Cavanagh 2009a).

Manaakitanga (Extend Holistic Care)

Students clearly expressed their expectation of being cared for by their teachers not only in their studies but also in cultural positioning (Macfarlane 2004). When asked "What does being a Māori student at this school mean?," one student explained that school only comes to life for her on Tuesday afternoon during the school kapa haka practice (Māori arts performance). The student wanted to indicate that to succeed in school she must leave her identity as Māori at the school gate (Cavanagh 2009b, p. 69).

As part of the project, the teachers created a new policy which they called "care before censure." This new policy offered alternatives to traditional forms of discipline and punishment and, additionally, generated in the school community the capacity to handle conflicts in nonpunitive ways (Cavanagh 2009a). Four principles underpinned this new vision of "care before censure": (1) the answers to behavioral problems should be individualized and appropriate to the harm caused; (2) behavior problems are usually symptoms of other problems; (3) it is likely that students lack the language to express their feelings and concerns; and (4) misbehavior is an opportunity to learn better ways of acting (Cavanagh 2009c, p. 57).

Findings and Outcomes

This study concluded that interpersonal relationships are at the heart of a school, involve every person in the school community, and are the fundamental reason why

students attend school and strive to succeed. Prior to institutionalizing the culture of care at school, based on the principles of *whakawhanaungatanga* and *manaakitanga*, learning was prioritized and the care of the student as a person with a specific cultural identity was secondary. Rather than the traditional way of doing education, emphasis was converted to the development of respectful and caring relationships between students and teachers; therefore, there is a commitment to a cultural change that focuses on school communities that are welcoming for children and young people. In this new community of relationships, power is shared, based on the self-determination of learners together in interdependence (Young 2004), the dignity of each person is respected, and the sense of solidarity is reaffirmed and contributes to the welfare of all.

United States of America: Culture of Care

This Culture of Care research and professional development pilot project took place at an urban high school in the state of Colorado. Approximately 2000 students attended the school, with over 60% of those students identifying themselves as Latino/Hispanic, about 27% of those students being classified as having limited English proficiency, and about 75% being eligible for free or reduced-cost lunch.

The project sought to address a critical problem regarding the achievement and retention of Latino/Hispanic students at the selected high school. The project was planned to span 3 years in three phases: 2011–2012 needs assessment, 2012–2013 capacity building, and 2013–2014 sustainability.

A qualitative research approach was used, based primarily on an ethnography research design (Patton 2003), since the purpose of the pilot project was to learn about and then change the culture of the school from a traditional culture focused on rules and punishment to a culture of care.

In addition, the guiding methodology for collecting and analyzing data was participatory, based on the collaborative interactions of university researchers, Latino/Hispanic students, their parents, and teachers (Moll and Cammarota 2014). The intent was to paint a portrait of what it was like to be Latino/Hispanic at the school of interest when the project first began and for the next 3 years as the culture at the school changed (Lawrence-Lightfoot 1983).

Building positive and caring relationships was at the core of creating a culture of care at the school. However, there was a lack of understanding regarding how to create a culture of care at the school that would benefit Latino/Hispanic students. Therefore, the project sought to not only introduce the theory of a culture of care to educators at the school but also to gather evidence for gaining an understanding on how to create that culture of care. The culture of care aimed to help Latino/Hispanic students flourish, not only at the school but beyond, in the workplace, college, or university.

Data Stories

The first year of the project focused on needs assessment. The central question was: What are the perceptions of Latino/Hispanic students, their parents, teachers, and school administrators regarding the experiences of these students at school?

The emerging evidence showed tensions or differences between the Latino/Hispanic students, their parents, and school administrators on one hand and at least some teachers on the other hand. The evidence suggested that teachers often failed to take agency in making a difference for their students of color because the students came from homes of poverty. That position led these educators to focus on deficit theorizing about these students (Valencia 2010). Overall analysis of the data revealed that creating a culture of care at this urban high school would require deliberate actions on the part of every person in the school community. A set of recommendations was made in order to bring the profound change required to: (a) meet the needs and expectations of Latino/Hispanic students and their parents, (b) reduce the tensions that exist at the school, and (c) focus on enacting these changes in the classroom.

The first recommendation was to focus on building the capacity of teachers and their students to respond to wrongdoing and conflict in the classroom in such a way as to address the harm that results within relationships. This was best accomplished by training teachers and students about the preferred practices of restorative conversations and talking circles. The aim was for referrals to be greatly reduced and hopefully eliminated so that Latino/Hispanic students spent most of their time in school devoted to learning.

The second recommendation was to revise the discipline policy to support restorative justice practices as the first option for responding to wrongdoing and conflict, and discourage the use of referrals by teachers. At the end of the 2011–2012 school year, a cadre of people was instructed on how to train others in these skills. These trainers were then able to help build the capacity of students, their parents, teachers, staff, and administrators in the use of these practices based on principles of restorative justice.

The third recommendation was to continue the Culture of Care research and professional development project in the 2012–2013 school year. The recommendation included continued work with the 15 teachers who participated in the project in the 2011–2012 school year and inviting more teachers to participate in the project in the upcoming school year. This approach was chosen as being the most likely to change the culture of the school and improve educational outcomes for Latino/Hispanic students.

Capacity building was the focus for the second year. Learnings from the needs assessment in the first year, primarily emerging through the voices of the Latino/Hispanic students and their parents, were the basis for building the capacity of educators at the school.

Restorative justice professional development training was held for 12 educators prior to the commencement of the second school year. The training was held at the request of the Latino/Hispanic parents and funded by a grant obtained by these

parents. Subsequently, restorative justice practices were shared with members of the school community, including students, their parents, teachers, administrators, staff and community members, and an observation tool and a self-assessment tool were introduced. In addition, monthly meetings were convened by an Equity Team, whose role was, among other things, to monitor progress that would ensure particular ethnic groups had a voice and were not seen to be disadvantaged in any way.

Sustainability was the focus for the third year of work at the school. The idea was to sustain the capacities built in the second year, particularly where these capacities legitimated the voices of the Latino/Hispanic students and their parents which had been gathered in the first year of the project.

Supported by the research team, the school's Equity Team initiated the ongoing use of an "Equity in Action Walk Through" using a culture of care observation tool that had been introduced during the prior school year. After the observations were carried out, a debriefing session was held to consider the identification of strengths, drawbacks, and next steps. As the participants left the debriefing session they were asked to write on "post it" notes what was in their head, what was on their heart and what they wanted to put into action based on what they had just learned (what was "on their hand").

In addition, further restorative justice training was facilitated with students, parents, teachers, administrators and community members, under the direction of the dean of students. In particular, the use of talking circles for resolving conflicts and responding to problems gained widespread use both inside and outside of the classroom. In fact, the use of restorative justice practices at the research school site became so widely known that they were highlighted on PBS *NewsHour* (a high-profile nightly television news broadcast).

Findings and Outcomes

The primary goal of this pilot project was to improve the amount of time Latino/Hispanic students spent in the classroom learning. The objective was to build the capacity of students and teachers at the school to respond appropriately to wrongdoing and conflict in the classroom so that the number of referrals would decrease. A decrease in the number of referrals would indicate that students with discipline issues, who were traditionally referred to discipline experts outside the classroom for the administration of punishment, were being kept in the classroom and, as a result, had increased time for learning.

The quantitative data demonstrated that the effect of introducing restorative practices at the school was marked. With the introduction of restorative justice practices in the 2012–2013 school year, the use of restorative justice practices increased, and disciplinary events decreased. However, while disciplinary events, other than those related to the use of controlled substances, continued to decline, the use of restorative justice outside of the classroom also declined. The inference is that fewer students were being referred for discipline issues to administrators outside the

classroom as a result of building the capacity of teachers and students to respond to infractions and conflict using restorative justice practices, inside the classroom.

A local university had sponsored this pilot project with the idea that a change in the culture at this school within its catchment area might result in more Latino/Hispanic students graduating from high school and being eligible to attend a university. Therefore, there was an interest in how the pilot project might have affected high-school graduation rates.

Data showed that at the same time as referrals declined, the graduation rate increased. Indeed, the graduation rate improved from about 65% the year before the Culture of Care initiative was introduced at the school to nearly 80% by the end of the 2012–2013 school year.

The Culture of Care research and professional development project was conducted as a pilot project. Therefore, the emphasis in these conclusions was on what lessons were learned through this three-year project that would help in the implementation of the project at other schools in the future.

When the project was proposed, 3 years was postulated as a timeframe to enable outcomes for key project objectives. The pilot project demonstrated that 3 years was adequate time to change the culture of this school through use of the following stages: (a) needs assessment, (b) capacity building, and (c) sustainability.

These stages were supported by the participation of Latino/Hispanic students and their parents. In the first year, the focus was on legitimating their voices (Bishop 2005; Bishop and Glynn 1999). Focus group interviews were used to create “testimonios” (Gutiérrez 2008) to legitimate the experiences of these students in school in terms of what it was like to be Latino/Hispanic at the school of interest. The second year continued the process by activating the voices of these students and their parents (Freire 2005). The findings from typological and inductive analysis (Hatch 2002) of the focus group interview data created the framework for professional development of teachers during the second year in order to build their capacity to engage with these students in a culturally relevant manner (Gay 2010; Gere et al. 2009) and move away from deficit-based pedagogies (Valencia 2010). In the third year, a culturally sustainable pedagogy was created at the school that supported the Latino/Hispanic students and their families by building upon the cultural and linguistic capacities they brought with them to school and, at the same time, providing these students and their families with access to competencies valued by the dominant culture in the United States (Paris 2012).

Discussion

Each of the research projects had a central objective regarding care or the ethic of caring within a school culture. However, when compared, a series of further commonalities emerge and these are of interest, especially as each project had no preexisting collaboration with the other two sites.

Common Modes

A range of process elements or modalities were common to all three projects. All of the projects sought a shift in whole-school culture, not just new approaches to discipline or teaching practice. The three sites used multiple strategies that were mutually reinforcing. Professional development for teachers was a part of all the projects, as was the integration of restorative justice practices within school procedures and culture. The methodology of participatory action research was common to all three projects, while appreciative inquiry was also used in the Aotearoa New Zealand site. These approaches allowed the gathering of local voices within a specific context while simultaneously giving agency to the participants.

Common Themes and Constructs

The common themes that emerge across the different projects are underpinned by a number of constructs. Many of these constructs overlap or cannot be easily disentangled from each other. A set of the key constructs is discussed below.

A central construct is the fundamental role of relationships in the learning environment and culture of the school. In these paradigms, “relationship” is taken to mean an emphasis on the dignity of each person and the importance of building and maintaining interactions which uphold that dignity. The PCR work in Latin America observed that human interactions per se create care-less situations, breaches, and misunderstandings, which affect negatively on the dignity of people. As a consequence, a further construct in all the projects was the need for forgiveness and reconciliation to affirm dignity and to make possible an ethic of care. Understanding that harm occurs within a relationship and that this needs to be put right was implicit in changing attitudes to conflict and wrongdoing. For all the participating sites, a crucial component to changes in attitudes and school culture was the integration of restorative practices within school procedures, including processes to enable forgiveness and reconciliation.

Placing an emphasis on relationships and restoration inherently positions schools as places where we learn to live together, not just where we learn to learn. The repositioning of school priorities regarding cognitive curriculum and the inclusion of relational and socio-emotive skill-building were other important phenomena within all projects. Further, an emphasis on relationships intrinsically recognizes individuals as members of families that have a cultural and community orientation. All of the site work described above involved the schools undertaking extensive engagement and dialogue with families and communities. Central to engagement was the provision of opportunities to strengthen the voice and agency of students and families as well as those of teachers and staff. Processes such as the research game “Five Pointed Star” in the Latin American project gave whole communities input to reshaping school and classroom culture. Similarly, at the urban school in the United States, the Latino/Hispanic parents were given voice within the school environment, which included input on professional development. In Aotearoa New Zealand and the United States in particular, this dialogue legitimated the voice of students and

families from minority cultures, and helped teachers cross the cultural boundaries that separated them from their students. Overall, the engagement with Indigenous and minority culture students and families assisted schools to create more culturally responsive pedagogies. Finally, the projects used reflection processes and dialogue to engage in critical thinking. That critical thinking led to agency through the use of action plans and creating new school priorities, such as the “Care before Censure” policy in Aotearoa New Zealand.

Common Theoretical Frameworks

All three projects draw from ethic of care theory which emerged as a body of literature in the 1980s. The ethic of care in education was particularly developed by Noddings (1984), and contributed to by thinkers such as Held (2006) and Slote (2007). Noddings emphasizes the centrality of caring in the role of teachers and schools, and observes that the ideal of caring evolves from a natural sympathy that human beings innately feel for each other (1984, 1992). Care is conveyed on many levels, including both the institutional and individual levels, and Noddings contends that “[p]ersonal manifestations of care are probably more important in children’s lives than any particular curriculum or pattern of pedagogy” (1995, p. 1). Awareness that another person may have a different way of seeing the world is the catalyst for Noddings’ call for a shift away from the motto of “Do unto others as you would have done unto you.” The caring approach, she advises, prefers the language of “Do unto others as they would have done unto them” (Noddings 2012, p. 56). An earlier expression of the ethic of care is the *te ao Māori* value – *manaakitanga*. Macfarlane (2004) describes *manaakitanga* within the classroom setting as including caring processes, culturally safe environments, and sound intercultural communication. In the concept of *manaakitanga*, “caring is obligatory and has reciprocal ramifications, suggesting that teachers who value others will be valued in return” (Macfarlane 2004, p. 81).

The projects also draw on sociocultural theory. A starting point for defining sociocultural theory suggests that it is an interdisciplinary scientific entity which seeks to understand the nature of the interaction between two principal constructs: social and cultural (Macfarlane et al. 2015). As such, sociocultural theory has areas of overlap with ethic of care theory but significantly enlarges the sphere of interest. In particular, sociocultural theory is based on the way Indigenous and culturally diverse people see the world (Feryok 2013; Smith 2012).

As human beings, we inherently desire to live in relationship with other people. Those relationships are based on the recognition that a person’s dignity is a birth-right, and no person has the right to attack that dignity. Consequently, the behavior of a person needs to be viewed separately from who they are as a person. Rather than seeing behavior of children as a snapshot, people embracing sociocultural theory view behavior more in line with a video of the child over a lifetime. Macfarlane and colleagues suggest that “socioculturalists seek to acquire basic knowledge about how people think about, feel about, relate to and influence one another in a socially and culturally specific context – and why they do so” (Macfarlane et al. 2015, p. 20).

As illustrated in the research projects discussed above, this wider perspective embraces and elevates the role of local, cultural communities, and the families of ethnically diverse children and young people attending the school, in determining what being culturally responsive means for the local school community.

Within sociocultural theory, teachers are also seen as responsible for, at least in part, and contributors to the behavior and the academic achievement of the children they teach. This viewpoint enables issues related to behavior to become an opportunity for learning rather than a barrier to learning. In the research projects discussed above, changes in school culture and procedures enabled behavior matters to become a context for growth rather than abrogation. A shift in the way educators traditionally think, talk and act with regard to schooling is implicit in sociocultural theory.

Similarly, Freire's humanizing theory of education, described in *Pedagogy of the Oppressed* (1992), also calls for a philosophical shift in educational understanding and practice. Freire argues passionately for a humanizing education, one counterposed to the dehumanizing practices he saw in "traditional education" – what he calls "banking education." For Freire, "banking education" is dehumanizing in that it focuses on the dispassionate acquisition of "formal" knowledge, which is presented as static and externally generated. The teacher's role is to then transmit this "knowledge" to students in ways that focus on unquestioning acceptance of "things as they are," and which tend to serve the social status quo. Such education is dehumanizing, Freire argues, because it discounts the lived experiences and emotions of both teachers and students. Moreover, he notes that this traditional form of education is often underpinned by punitive, authoritarian forms of institutional control. Freire argues instead for an educational process of conscientization which enables students and teachers to develop a critical consciousness of the world. This, in turn, allows them to take action in their world and potentially bring about transformation. The underlying implication is that teachers are not the sole bearers of knowledge; rather, students and teachers are both engaged as educators and learners (Fickel 2008).

The schools described in the research sites confronted many of these challenges of the traditional "banking education" and sought new ways of engaging and responding to their students and communities. In seeking these new ways, the schools began their journey by engaging teachers in self-reflection exercises and set about changing school cultures to reflect a more critical consciousness of the world pertinent to their context. In this way, their stories of change illuminate the process of "humanizing education" by offering up for consideration pedagogies and practices that ensure all members of the school community have voice, are affirmed in their identity, and have a sense of agency (Nieto Ángel et al. 2015).

Ngā Tapuwae Mō Muri: Footprints into the Future

The conceptualizations that emerged in the processes associated with these research sites culminated with interrelated understandings of restorative justice thinking and practice with young people within and external to their schooling experiences. Both Indigenous and non-Indigenous worldviews were integrated in the schools' processes,

often subconsciously. The first conceptualization of restorative thinking and practice is based on the use of restorative justice that is in contrast with punitive retributive justice and focuses on the needs of the wider community in terms of *whakatika* (putting matters to right). The second conceptualization is based on approaches related to culturally responsive and relational restorative thinking and practice. This approach offers a more complex and wider analysis of the reasons why certain groups of young people are more prone to wrongdoing and to be stigmatized. This analysis emphasizes historical, social, and cultural processes of reproduction of systemic marginalization and exclusion that affect and disadvantage disproportionately different social groups and create conditions where young people are placed at risk. The notion of restoration, in this case, emphasizes that young people themselves are casualties of systemic inequalities, and focuses on restoring their balance, wellbeing, and self-esteem through establishing safety and positive relationships in their immediate environment. This analysis implies that internal balance and a relational focus that compels a reorientation towards the common good will address the conditions that prompted the contravention and prevent repeating of the unacceptable behavior. These conceptualizations are attuned to the “traditional Māori discipline model” referred to earlier in the chapter (see Olsen, Maxwell, and Morris (cited in McElrea 1994)).

The third conceptualization of restorative thinking and practice has resonance with the Ka Awatea research project (Macfarlane et al. 2014) and the literature on global youth justice, self-reliance, and complex societies (Andreotti 2010). This literature extends the deliberations to include the need for young people to build self-reliance to contribute to social prosperity grounded on a commitment to the common good. In contrast with individuated or individualist ideals of the stigmatization of some sections of young people in society, this analysis highlights the potential for young people to change the system from within and gives them an active role in addressing injustices and inequalities in solidarity with people in their communities and with people in other parts of the world. The notion of restoration is related to systemic justice (not just individual or communal justice). Based on Indigenous views, this analysis implies that restoring systemic justice in the long term will cease the reproduction of the conditions that create injustices, inequalities, and disadvantage, which are the key factors influencing high rates of youth contraventions. The involvement of young people in this process emphasizes their agency, their capacity and potential to create change, and their responsibility to decelerating systemic cycles of injustice. It gives them a space where they can safely exercise dissent, a meaningful social role and a relevant place oriented towards the collectivity in society. Each of the three understandings of restorative justice, rooted in Indigenous epistemologies, complements and expands the scope of the others, offering a pathway towards social balance and integration.

Conclusion

The global imperative to consider new ways of “doing school” has become evident as conflict levels increase and educational disparities fuel a fragmentation of societies. School leaders and teachers, positioning themselves to respond to the twenty-

first-century dynamics of change, face a complex landscape. This landscape includes a range of recent theoretical frameworks which may inform these challenges and a raft of possible school practices and activities. This chapter has sought to illuminate the emerging landscape by identifying common points at issue associated with positive outcomes in three globally diverse school settings. Significant constructs emerged in the form of the fundamental role of relationships in the learning environment, the necessity to employ restorative approaches in fostering these relationships, and positioning schools as places where families and communities are engaged and where students successfully live to learn and learn to live.

Young people are our future. Ensuring all young people transition to adulthood on a trajectory to an inclusive and successful life will benefit all aspects of development – health, economy, and, of course, education. This chapter has signaled that when research reveals authentic frameworks emerging from ethical values and culturally responsive positions, the quest for better futures can indeed become a reality.

Abstract

Keaomālamalama describes the reinvigoration of Hawaiian consciousness as a metaphor for enlightenment through a transformative process that recenters, reshapes, and rejuvenates responsive Hawaiian educational models and initiatives towards sustaining vibrant and abundant communities. This chapter utilizes Indigenous Empowerment Theory (IET) to analyze the transformational nature of education in Hawai'i. Six catalysts, over four major historic periods of time, are discussed in terms of the ways they have impacted the vitality of Hawai'i's people and society. Four case studies provide "mo'olelo (narratives) of practice" as evidence to illustrate the educational change experienced over the last two generations. These examples are grounded in a 'ohana (family) mindset as the lens from which Hawaiian education has impacted educational reform, leadership, and policy in Hawai'i. The chapter concludes with Keaomālamalama, a series of four summit gatherings among educational leaders, organizations, and critical community and institutional partners towards a vision, "*O Hawai'i ke kahua o ka ho'ona'auao*" (Hawai'i is the foundation of our learning) for recalibrating the direction of Hawaiian education. The key elements and lessons learned will be discussed as closing insights—*i ke ao mālamalama* (towards an enlightened world).

Wehena: An Opening, an Introduction

Kau e ka wena o ke ao i ka lani.

The announcement of dawn appears as a glowing streak across the [night] sky.

He wekeweke i ka pō pilipuka.

It is a narrow opening in the darkness heralding the day.

He 'elele o ka poniponi hikina.

It is a messenger of the lavender glimmer from the east.

Kau ke kāhe'a wana'ao i ka 'āla'apapa,

Streaks of red color long cloud formations,

La‘i ana i luna o ke kūkulu o ka lani lā.

Reposing serenely upon the pillars holding up the heavens.

‘O ka‘u ia e huli alo nei i ka ulu ē.

I turn to gaze upon this, focusing on the growth and the rising of the new day.

‘Ae, ua ao ē.

Yes, a new day has arrived.

Hō mai lā kō mālamalama

Bestow upon us your radiant light

I ka honua nei i ka maui ola.

Here on earth filled with the spirit of life.

Ua ao Hawai‘i ke ‘ōlino nei.

Hawai‘i is in the brightness of day, it shines brilliant.

Mai ka pi‘ina a ka welona a ka lā,

From its boundaries at the sun’s rising to the sun’s setting,

Kāhiko ‘ia i ka ‘ike manomano,

It wears as its finery a myriad of knowledge,

Ka ‘ike kōli‘u mai o kikilo mai.

Of deep insight from the depths of antiquity.

‘O ka‘u nō ia ‘o ka pūlama

My sole duty is to embrace and to cherish

A pa‘a ma ka ipu o ka ‘ike ē.

So it may be firm in the repositories of enlightenment.

‘Ae, ua ao ē.

Yes, a new day has arrived.

He mele no Hawai‘i ua ao.

This is a poem for Hawai‘i which has seen the light of day. (Kimura 2016)

Ua Ao Hawai‘i, Hawai‘i has dawned into a new day. This mele (chant) can be heard in many schools across Hawai‘i as part of the morning school protocol and often at Hawaiian education events. The words call out to acknowledge and embrace the presence of a new day. Kimura (2016), the composer of this mele, reminds us that “with the dawning of each new day we can consciously decide to live through our own distinct language and culture to maintain our Hawaiian identity and Hawaiian well-being. . . we have the choice between a vital Hawaiian identity or an unconscious merging into homogeneity” (p. 30).

Keaomālamalama (dawning of enlightenment) sets the direction for Hawaiian education grounded in our sense of place, language, culture, genealogy, aloha, and connection to Hawai‘i through an ‘ohana (family) mindset as a foundation for transforming education in Hawai‘i. Through a series of Hawaiian educational summits, Keaomālamalama continues to provide a critical space for community voice to co-create and advance a shared vision for Hawaiian education (Watkins-Victorino et al. 2014). As members of Keaomālamalama, the authors of this chapter offer a theoretical framework that describes the pendulum shift of Hawaiian education through a historic perspective for consideration.

Highlighted examples through mo'olelo (narratives) of practice illustrate the progress and transformational change of education in Hawai'i through culture-based educational models and initiatives that meld traditional understandings into current day critical strengths-based practice.

Indigenous Empowerment Theory (IET): Native Control of Native Education

Theories and paradigms offer particular representations of how the world operates that impact research studies (Merriam 1998; Patton 2002; Bogdan and Biklen 2007). Embedded within are the values, ways of being and knowing, and worldviews of its creator (Patton 1978) and as such should be examined and understood before use (Lincoln and Guba 1993).

Smith (1999) has highlighted the difficulties of using theories and paradigms that inadequately describe the state of indigenous peoples. Freire (1996) posited that the knowledge about those who have been oppressed and subjugated has been used to reinforce theories of supremacy and discrimination rather than understanding or emancipation. In the case of Native Hawaiians, theories perpetuating deficiencies in students and their families canvassed research and publications for decades like a "worm that will not die though cut shorter and shorter by logic and evidence" (Tharp et al. 2007, p. 272). Moreover, Kaomea (2003) has also noted the many ways negative stereotypical practices considered "Hawaiian" have maligned and distorted the cultural and linguistic integrity of the indigenous peoples of these islands.

Denzin and Lincoln (2011) have argued for critical, indigenous, decolonizing theories that "articulates...ontology based on historical realism, an epistemology that is transactional and a methodology that is performative, dialogic, and dialectical. It values ethical systems embedded in indigenous values. It transfers control to the indigenous community" (p. 22). More importantly, unlike a singular theoretical lens to explain what Hawaiians are, as well as how they think, act, and believe, research and theories must not only emancipate but also re-empower native communities.

The authors of this paper have examined and utilized the journey of Hawaiian education – from a state of powered wholeness (pre-Western contact), through colonization and disempowerment and regenerated power, to a future state of re-empowerment (renormalization of language, culture, and identity) – to generate the Indigenous Empowerment Theory (IET). Like research framed in Empowerment Theory that challenges and disrupts oppression and prejudice (Perkins and Zimmerman 1995; Zimmerman 2000), IET can be used to inform the knowledge surrounding individual and community change.

As with the counter narratives of Ogbu (1978), Ladson-Billings and Tate (1995), and Demmert (2001), Indigenous Empowerment Theory suggests that a pattern exists in the decline and rise of a native people's ability to control and strengthen their well-being. Unlike past theories used to underplay two centuries of Hawaiian orthography under colonial rule, IET liberates the underground movement of Hawaiian nationalism carried by families and communities. It dispels conventional

theories that describe Native Hawaiians as passive, voiceless receptors of American rule and highlights the continual challenging of nonindigenous control and rule. IET expands empowerment theory to include collective action found in families and communities that continued traditional practices, the use of Hawaiian language, and other epistemological understandings (Meyer 2003). Fueled by a greater desire to take back control of education, political, economic, and social arenas that govern and impact these islands, IET seeks to torch worm-like deficit theories and replace them with a roadmap that describes the rise of Native Hawaiians through its families and communities.

So, what are the components of this Indigenous Empowerment Theory? IET offers an analysis matrix – six catalysts make up its vertical axis and four time periods or eras across its horizontal axis – to assist researchers in uncovering the historic events that have impacted the education of Indigenous peoples. In terms of the catalysts, Plank et al. (1996) Punctuated-Equilibrium Theory presented five key catalysts for change and reform – political, social, cultural, economic, and educational. Kahumoku (2000) presented a similar set of five catalysts – *politics* and political powerbrokers, *societal* and demographic influences, *cultural* and linguistic circumstances, *economic* conditions, and *educational* movements – that predicated the development and articulated the impacts of two language education policies. A sixth catalyst – *familial* and native knowledge transference – has been added to represent the impact of families and other community knowledge keepers who held onto native cultural and linguistic practices in spite of assimilatory practices of colonization.

IET defines these six catalysts as:

- *Politics and political powerbrokers*: activities of political elite who control the governance of a country through a set of public policies and who have the responsibility to remediate conflict among its people.
- *Societal and demographic influences*: spiritual, physical, emotional, and social factors – housing, agriculture, health and medical practices, others – that impact the well-being of a community and/or nation.
- *Cultural and linguistic circumstances*: the state of native knowledge, practices, language use, and other factors that sustain native identity.
- *Economic conditions*: The influence of industry, employment, and other economic factors that impact indigenous people.
- *Educational movements*: English-only policies, crusades to remediate the savage native, push for the building of boarding schools to train Christian educators, and other large-scale school reforms that affect the education of native students.
- *Familial and Native Knowledge Transference*: Indigenous practices, language, belief systems, and other culture-based ways of being that were generationally passed down in homes and communities and survived colonial efforts to, as Adams (1988) writes, wash the native out of the native.

Along the horizontal axis of this matrix are four eras or time periods. These four eras – powered, disempowered, regenerated power, and the future state of

empowered – represent four distinct time periods in Hawaiian history. IET defines these four eras as:

- *State of Being Powered*: a time in history prior to Western contact where a native people controlled its own ways of being and believing. While IET acknowledges that interactions with others impacted a people's self-determination and sovereignty, analysis begins when an indigenous group considered itself as whole and intact.
- *Disempowered*: a time period when Western influences increasingly supplant a native people's right to self-determination over its system of government, resource management, religious and cultural practices, worldviews, and others. Whether by force or gradual acquisition, nonnatives become the powerbrokers that control all or most of a society that was once native.
- *Regenerated Power*: a period of time where conflicts and clashes occur between natives and nonnatives over critical issues affecting the well-being of that indigenous population. This era marked by advocacy and protest by natives for control over systems that were once under the authority of their ancestors – education, land use, traditional knowledge, language revitalization, and the like.
- *Empowered*: a future state where natives once again control the systems that sustain their well-being. During this era, native self-determination over government, economy, society, family life, and other systems ensure continued strengthening of their indigeneity and overall well-being.

Indigenous Empowerment Theory provides a way to examine what has occurred to Hawaiians and other native communities across the world (Fig. 1). For instance, Adams (1988) and others (Dehlye and Swisher 1997; McCarty 2009) have chronicled the impact of public policy on the education of American Indians. At the

Fig. 1 Indigenous Empowerment Theory Catalysts

height of westward expansion during the 1800s, Congress authorized the Indian Removal Policy that relocated, at times forcibly, American Indian tribes like the Cherokee, Muscogee, and Chickasaw from the Southeast to the Midwest. Also, throughout the latter nineteenth and well into the twentieth centuries, Indian children were taken from their homes, at times forcibly, with the intent to civilize and Christianize the native out of the them (Adams 1988).

Benham and Heck (1998) and others (Kuykendall 1953; Daws 1968; Fuchs 1984; Kahumoku 2005) illustrated the impact of capitalism on Native Hawaiians when they studied the importance of sugar and the plantation economies in Hawai‘i. Power elites, many of whom were either transplants to the islands or the sons or grandsons of protestant missionaries, persuaded the Hawaiian monarchs to fund a system of education patterned after its American counterparts.

This school system was dedicated to producing a workforce for the plantations that could understand their English-speaking bosses. In turn, by 1896, these policy brokers enacted Act 57 that outlawed the use of Hawaiian as the medium of communication in Hawai‘i’s classrooms (Kahumoku 2005).

Newson (1985) outlined the devastation caused by European entry into the Americas. Systematic killing, enslavement and ill treatment, and the terminal spread of epidemic diseases of which indigenous populations had little immunity led to the widespread decimation of natives throughout the Caribbean and the Americas. In the Caribbean, whole cultures disappeared just within a few decades after European contact. Altman et al. (2003) documented the Spanish use of Catholicism as an institutional force to subjugate and indoctrinate, at times forcibly, natives. Utilizing the Catholic Church and its schools, Spanish language and culture spread rapidly throughout regions under conquistador rule.

The value of this theoretical model is twofold: first, it delineates those key events – contextualized within the six catalysts and four eras – to provide a comprehensive view of a native people’s journey. Second, IET’s era of empowerment allows for articulation of a future where an indigenous community re-gains power and control to sustain the well-being of its people.

Methodology: Theoretical Framework for Analyzing the History of Hawaiian Education

As previously presented, the Indigenous Empowerment Theory is founded on the journey of Native Hawaiians but also has application to other indigenous communities who have experienced a similar journey. This theory, formulated as a matrix, requires examination of educational transformation through the charting of historic, present, and future punctuated events.

As such, this chapter addresses the historic and current events that have contributed to the amazing educational journey of Native Hawaiians. This diagram illustrates the various Hawaiian eras as metaphorically connected to the traditional names for the periods of the Hawaiian day as it moves from night to mid-day. Each of the five phases of the day – Pō (Robust Hawaiian Society), Wana‘ao (Rising

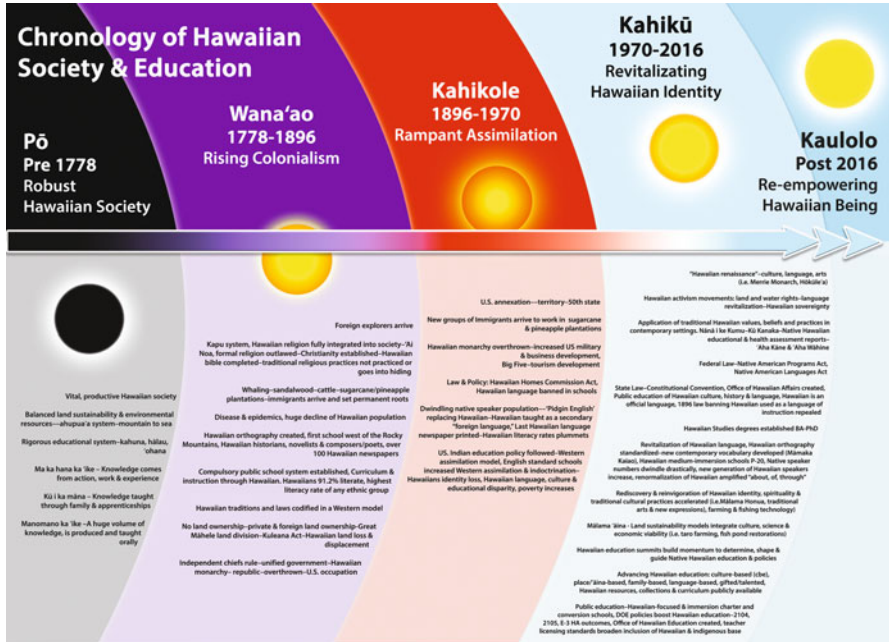

Fig. 2 Chronology of Hawaiian Society and Education

Colonialism), Kahikole (Rampant Assimilation), Kahikū (Revitalization of Hawaiian Identity), and Kaulolo (Re-empowering Hawaiian Being) – align with the four eras found in the IET (Fig. 2).

The Era of Pō (pre-1778): Robust Hawaiian Society

The Hawaiian context begins with a description of the era prior to Western contact when Native Hawaiians operated in accordance to their own ways of being and believing. Living on one of the most isolated landmass on the planet, it had been centuries since Native Hawaiians had contact with others and as a society; they were sovereign, whole, and intact. Much of the existing information about precontact Hawai'i i derived from the rich body of knowledge found in traditional forms of communication like mo'olelo (story, account, history) and mo'okū'auhau (genealogy) as well as studies and publications written by native and nonnative authors. For the estimated 200,000 to over a million natives living in the islands at the time of Cook's arrival in 1778, they passed down through a strong oral tradition their history, worldviews, and ways of being. As David Malo (1951) writes, "Memory was the only means possessed by our ancestors of preserving historical knowledge" (p. 1) and much of what we know today has been transmuted through generations of familial transference.

One of the finest examples of Hawaiian oral history that survived western contact was the *Kumulipo* – a Hawaiian creation chant. Beckwith (1970) credited King Kalākaua for initiating the written version of the *Kumulipo*, printed in 1889, and his sister and successor, Queen Lili‘uokalani, for its 1897 English translation. The *Kumulipo* – over 2,000 lines long – is one of the earliest texts that illuminate the important coexistence of the natural world and native Hawaiians.

The māka‘āinana (commoners) were organized by communities of ‘ohana that served as the basic social unit in Hawai‘i. Symbolically, ‘ohā are found in many deep and meaningful idiomatic wise sayings that poetically compare this regeneration to the progression and growth of children within traditional family structures. ‘Ohā is the basis by which the Hawaiian familial structure was named, ‘ohana. Handy and Pukui (1972) explained that the word, ‘ohana, itself is associated to the kalo (taro) plant.

‘Ohā means “to sprout,” or “a sprout”; the “buds” or off-shoots of the taro plant, which furnished the staple of life for the Hawaiian are called ‘oha. With the substantive suffix na added, ‘oha-na literally means “off-shoots,” or “that which is composed of “off- shoots.” This term, then, as employed to signify the family, has, precisely, the meaning “the off-shoots of a family stock (p. 3).

Handy and Pukui (1972) described these communities of ‘ohana – relatives by birth, marriage, and adoption – as living in an ahupua‘a (land division usually from the uplands to the sea). Handy and Handy (1972) noted that while some families were fishermen, most were planters. Van Dyke (2008) recognized that “the essential nature of pre-contact society was collective and cooperative through the ‘ohana structure” (p. 13). Handy and Pukui (1972) noted that the unifying power of the ‘ohana: “. . .was. . .constituted [in] the community within which the economic life moved. . .Equally the ‘ohana functioned as a unit in external economic and social affairs” (p. 6).

Within families, education began from the moment of conception when the young were guided by their mākuā and the rest of their ‘ohana. Handy and Pukui (1972) presented, “boys and girls acquired knowledge and skills by natural process, rather than by artificial means as in formal education” (p. 177). Also, while young ali‘i were raised by guardians or tutors (kahu), in simpler households, grandparents (kūpuna) tutored the young. Upon reaching adulthood, young adults – based on their strengths and proclivities – were sent to kahuna (experts) who selected advanced and specialized learning and training (Pukui and Elbert 1986; Handy and Pukui 1972).

Politically, Van Dyke (2008) estimated that around 1300 A.D., a hierarchy of ali‘i (chiefs) had emerged and held power and oversight responsibility for the maka‘āinana (commoners) and ‘āina (land). As the ruling elites, these chiefs in concert with their kāhuna (priests) instituted a kapu (prohibition) system that regulated and guided every aspect of Hawaiian life – e.g., appropriate planting and fishing seasons as well as the behavior of all social classes. Though they had great power and enjoyed the privileges of their class, they did not “own” the land or even the people on it (Van Dyke 2008). Handy and Handy (1972) even characterized the ali‘i’s role as that of “a trustee” (p. 63). Kamakau (1961) explained,

True the chiefs had the right to the fruits of the land and the property of the people. . . But it was they [the chiefs] who were the wanderers; the people born of the soil remained according to the old saying, 'It is the top stone that rolls down; the stone on the bottom stays where it is' [O ko luna pōhaku no ke ka'a i lalo, 'a'ole i hiki i ko lalo pōhaku ke ka'a]. Some chiefs laid claim to certain land sections in old days, but it is not clear that the residents born on the land held no rights therein. At any rate there were families who have lived on the same land from very ancient times. In that way the land belonged to the common people. (p. 376)

Archaeological data confirmed that Hawaiians had highly developed agricultural skills and systems. Kirch (2015) reported that in Kohala, the dryland agricultural system was "...densely planted in sweet potatoes, dryland taro, sugarcane, and other crops. This flourishing...system... [covered] roughly sixty square kilometers" (p. 283). Integral to the relationship between nature and native Hawaiians, agriculture worked in conjunction with the contours and resources found in the natural topography.

Without a doubt, the *maka'āinana* (the people *attending* to the land), organized in 'ohana units, provided the *kahua* (foundation, base) that supported and sustained Hawaiian society. When the 'ohana structure began disintegrating, particularly following Captain Cook's arrival in the islands in 1778, it eroded the core Hawaiian society – the family unit. As the next section illustrates, the impact of Western contact was severe and devastating.

Wana'ao (1778–1896): Rising Colonialism

Though the History Channel's website erroneously lists British captain James Cook's entry into Hawai'i as a European discovery, Native Hawaiians had already established for more than 800 years a vibrant, dynamic society (History Channel 2016). Once foreigners became aware of these islands, more poured in, recognizing this port of call a way point to refuel supplies and provisions before setting sail for another destination. They saw the archipelago's rich natural resources as commodities and quickly sought permission from island and regional rulers to harvest the whales in its waters and the sandalwood in its forests (Daws 1968; Kuykendall 1938). The island's economy quickly moved from sustainable subsistence to one based on the capitalism of whaling and deforestation.

During this same time period, a young Kamehameha Nui (the first) began his campaign to bring the islands under one rule. Kamakau (1961) reported that through each campaign, first on his home island and then onto other islands throughout the archipelago, Kamehameha I blended traditional warfare practices with foreign weaponry and battle tactics. But he also strictly maintained a traditional regulatory or Kapu system and was considered by many of his subjects to be the epitome of pono (righteous) ali'i (Kame'eleihiwa 1992). By his death in 1819, the Kingdom of Hawai'i had been established.

Regrettably during this same time period – 1778 to 1820 – hundreds of thousands of natives perished. By 1819, fewer than 135,000 natives remained alive (Crosby 1992). In

comparing the death toll due to Western contact in other Pacific island nations, Stannard (1989) writes: “Although the causes of some of these catastrophes included a combination of disease, warfare, enslavement, or other factors, the overwhelming cause in every case and the sole cause in most was newly-introduced infection” (p. 48).

In 1820, two critical events occurred that would also contribute to sharp erosion of Hawaiian belief systems. The first, the formal end of the kapu (traditional set of laws, policies) system, destabilized Hawaiian society. According to Kame‘eleihiwa (1992), when Kamehameha II (Liholiho) ascended to power and the devout Christian Queen Ka‘ahumanu became regent, the King sat with his regent to partake a meal, something that was forbidden by traditional practice and belief. The act abrogated the ‘Aikapu (eating taboo) and in effect shattered the traditional political system of laws, religious practice, and chiefly rule. While this lone event did not translate into the surrendering of religious practices and beliefs among the maka‘āinana, immediately following the act, Ka‘ahumanu and other chiefs also systematically began destroying religious sites (heiau) and images of Hawaiian Gods.

The second event was the entry of Protestant missionaries in 1820. According to Benham and Heck (1998), the missionaries were directed to “obtain adequate knowledge of” the native language to create its written form, produce the Bible in Hawaiian, “and above all, to convert them from their idolatries and superstitions and vices, to the living and redeeming God” (American Board of Commissioners 1838, pp. 27–28). Kame‘eleihiwa (1992) criticized that following the destruction of the kapu and religious systems, Christianity and the accompanying American values taught by the missionaries swiftly replaced native understandings about what was pono (right) as well as the very societal structures and mana (spiritual power) that held Hawaiians.

Churches and church schools began dotting the Hawaiian landscape and the production of Hawaiian speaking clergy led to the establishment of Hawai‘i’s first school – Lahainaluna (Maui) – in 1831 (Kahumoku 2000; Osorio 2002). Under Kamehameha II’s rule, sweeping laws were enacted – like the strict observance of the Sabbath that was decreed in 1824. “Unfortunately, included in the set of unlawful activities were the indigenous traditions such as the hula, oli (chant), and mele (song, poetry)” (Kahumoku 2000, p. 85). In a span of 20 years – 1820 to 1840 – schools expanded and a system of formal Western education was instituted within the Kingdom. According to Kahumoku (2000), the first institution enrolled 40 adult learners in 1820. By 1831, nearly 45,000 were taught in 908 mission/church schools and reached almost all of the adult population.

Once the adults learned to read and write, they lost interest and left (Daws 1968), requiring the missionaries to change tactics and focus their proselytizing on the young (Wist 1940). The Kingdom passed laws aimed requiring school attendance (Kahumoku 2000) and by 1840, some 15,000 native children attended the Kingdom’s public school system. As a vehicle to transmute ways of knowing, being, and believing, education, formerly held within the ‘ohana, now was controlled by foreigners whose intention was to replace indigenous ways with Western and Christian ones (Kahumoku 2005).

Politically, in 1839, the Kingdom of Hawai‘i passed its first Declaration of Rights and in 1840, its first constitution. Three branches of government were formed: judicial,

executive, and legislative. For the first time, commoners were granted the right to elect men to represent them and the power to authorize the laws of the land rested no longer with the monarch but in the hands of two legislative bodies – a house of nobles and one of representatives. Kame'eleihiwa (1992) argued that these democratic ideals perpetuated in these new laws also countered traditional Hawaiian lines of authority and relationships. Osorio (2002) suggested that the 1840 constitution and its representative government profoundly impacted Hawaiian society. While foreigners viewed the new set of laws as a way to sustain Western practices and ideals and thereby release the native commoner from the “ignorant and lethargic servitude to the status of free men,” for many Hawaiians, they clung “even harder to the chiefs whose exercise of power they, at least, knew and understood” (p. 42). Whether because of the continual threat of foreign takeover by England, France, or the United States – the three great powers in the Pacific – or that missionaries replaced Hawaiian ali'i as trusted advisors to the monarch, the 1840 Constitution codified democratic, Christian principles into law.

Meanwhile in society, the death toll among natives continued to rise. According to Kame'eleihiwa (1992), in 1823, protestant missionaries recorded 134,925 Hawaiians alive. By 1876, the Kingdom counted only 53,900 (full-blooded) natives and it is not until the 1930s that the Hawaiian population – the majority now of mixed ethnicities – rose to 400,000 (Stannard 1989). “The great dying disrupted the faith that had held Hawaiian society together for centuries” (Osorio 2002, p. 10).

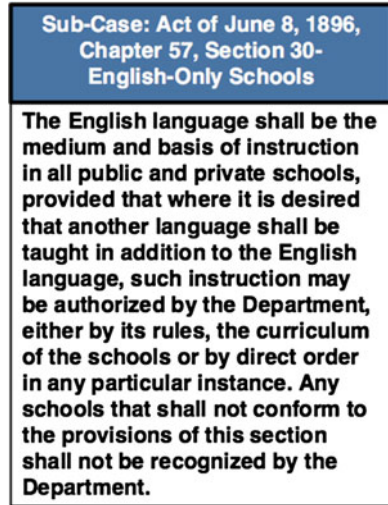

In 1850, the Kingdom's legislature allowed foreigners unrestricted rights to buy and sell land as well as allow commoners, the *maka'āinana*, to claim their own land awards (Osorio 2002). Non-Hawaiians began to accumulate property, and by the mid-1800s, large-scale production of sugar was well underway. As the islands' economy moved away from subsistence to capitalism, commoners left their lands and sustainable ways of life for work on the plantations and in turn, plantation owners began possessing more land – much of which was deemed as abandoned (Kuykendall 1938). Fueled by the expanding agricultural industry, the first contract laborers from China began arriving in the islands in 1852. They were followed by others like the Japanese, Portuguese, and Filipino. By the Kingdom's overthrow in 1893, Hawai'i was no longer home to only its indigenous population; Hawaiians became one of many who resided in these islands.

Several other significant developments occurred in the years leading up to the overthrow of the Hawaiian kingdom and the islands' eventual annexation to the United States in 1900. First, though the printing press was brought to Hawai'i as a means of Christianizing the heathens, Hawaiians swiftly took its possession and began publishing Hawaiian language newspapers (Kahumoku 2005). Between 1830 and 1846, 12,751 books were published and an estimated 65,000 pages of printed materials written in Hawaiian were produced (Kuykendall 1953).

According to Silva (2004), Hawaiians utilized print as a means of understanding the world and chronicling important matters of the day, recording Hawaiian knowledge, and protesting against the growing power of nonnatives.

A second development during that latter half of the nineteenth century was the displacement of Hawaiian language with English. In 1841, King Kamehameha III, Kauikeaouli established the kingdom's public compulsory education system.

Fig. 3 English-Only Schools, Subcase 1896 (Kahumoku 2000, p. 36)

All subjects academic and vocational were instructed through the Hawaiian language. Silva et al. (2008) stated that by the late 1800s, the Hawaiian literacy rate of among Native Hawaiians was over 91% and, “at the time exceeded that for any ethnic group in Hawai‘i, including Whites” (p. 7). Wist (1940) articulated that the number of English-medium schools “took a considerable leap during the decade between 1878 to 1888” (p. 72). Correspondingly, the number of schools (called Common Schools) teaching through the Hawaiian language dropped from 412 in 1854 to 36 in 1890 (Schmitt 1977). A year after the overthrow in 1893, there were merely 18 in existence and by 1896 when Act 57 banning the use of Hawaiian language in schools was passed, no common schools were operating (Fig. 3). Also, official documents that were once written in both English and Hawaiian were now written only in English. “Whether the displacement of the Hawaiian language by English was a product of or a step toward annexation is still debatable. What must be acknowledged, however, is that the movement to place English as the language of choice and its end product, Act 57, left devastating imprints on the Native Hawaiians” (Kahumoku 2000, p. 136).

Kahikole (1896–1970): Rampant Assimilation

Emerging from Wana‘ao, the period of Kahikole at the turn of the nineteenth century continued to bring dramatic changes for Native Hawaiians. Politically, Osorio (2002) – recognized that in the decades leading to the overthrow of the Hawaiian monarchy, control over the government transferred from Hawai‘i’s sovereign monarchs and to white businessmen who sought markets for their industry – especially sugar. At the turn of the twentieth century, as Hawai‘i’s Territorial Government is established, the island’s white power brokers controlled not only the government but also much of Hawai‘i’s economy, society, and education.

Although Asian immigrants entered Hawai'i prior to 1900, arrivals intensified during this era as sugar, pineapple, and later tourism continued to transform the islands' landscape. Takaki (1983) noted that in the time between 1836 when the first sugar plantation opened in Koloa, Kaua'i to 1920, over 90,000 Chinese and Japanese immigrants arrived for work. At the turn of the century, large scale pineapple plantations ushered in another wave of immigrants from the Philippines and by 1930, more than 50,000 Filipino contract laborers lived in Hawai'i (Cooper and Daws 1990). To fuel these large scale agricultural ventures, tunnels and canals to transport much needed water from wetter areas to drier climes were built. As a fallout, native Hawaiians who were still cultivating kalo [taro] – a native dietary staple – found their lo'i (kalo beds) dry and unusable (Perry 1914).

By the mid-1900s, agriculture gave way to tourism. In 1921, some 8,000 tourists arrived in Hawai'i (Mak 2015). By 1949, 34,000 tourists visited and by statehood in 1959, over 243,000 vacationed in the islands (Tisdell 2013). The dramatic spike in tourism after statehood was due in part to America's strong postwar economy and the introduction of commercial jet service to the islands (Tisdell 2013). By the close of this period – 1970 – much of Hawai'i's economy was based on tourism.

In the midst of economic and political change between 1900 and 1970 – from traditional sustainability to agrarian to tourism-based economies and from a monarchical kingdom to US territory to US state – the societal transformation of the islands was equally historic. Social issues such as low income, high unemployment, family violence and abuse, substance abuse, and Hawaiians being incarcerated grew alarmingly. According to Alu Like (1985), during the period between 1949 and 1962, Native Hawaiian males had the highest suicide rate while 22.5% of them took home earnings that qualified them impoverished. By the mid-1970s, the native Hawaiian unemployment rate almost doubled that of the state (11.6% vs. 6.5%, respectively).

In addition to the economic, political, and social blights faced by Native Hawaiians, from 1900 through the post-World War II industrial boom, Hawaiian family structures continued to disintegrate. McCubbin et al. (2010) noted that those of Hawaiian ancestry had lowest socioeconomic status, had fewer support mechanisms to help families deal with major life challenges, were more apt to be multiethnic as well as multiracial, and were more prone to be dysfunctional.

In terms of the education, during this era, Hawaiians were being assimilated into an American way of life (Kahumoku 2000). The creation of English standard schools in 1924 separated those who could successfully pass an English proficiency test and enter these specialized schools from those who could not and thus had to attend public common schools. One of the intended goals, according to Hughes (1993), was to educate Hawai'i's children in American values and some who attended these institutions considered them as a means to social and economic stratification.

In addition, Hawaiian cultural and language education during this time existed in very small enclaves, and if taught at all, the contents were based on the notion that Hawaiians as a race were long gone (Kahumoku 2000). It is not until Hawaiian authors like Pukui and publishing houses like the Bishop Museum that cornerstone Hawaiian texts became available and accessible for public consumption. Even

against the wishes of many natives who advocated for keeping native wisdom hidden, Pukui and her counterparts began publishing the Hawaiian dictionary and other books. They are now credited for the Hawaiian Renaissance movement of the 1970s and their foundational texts have become “must reads” for understanding Hawaiian culture and language.

Finally, hidden from rampant American assimilation, Hawaiian homes across the islands inaudibly nurtured and perpetuated ‘ōlelo Hawai‘i (Hawaiian language) and ‘ike Hawai‘i (Hawaiian knowledge) (Kahumoku 2000). Hula, traditional fishing methods, the growing of kalo, and other Hawaiian practices were passed down through generations of Hawaiian families, outside of the purview and regulation of those who controlled formal education. While Hawaiian identity during this era is reduced in general society to a few Hawaiian place names, practices, and values, it is in strength of key ‘ohana – the waihona (keepers) of Hawaiian knowledge, language, and culture – that the architects of the Hawaiian Renaissance built the foundations to a Hawaiian controlled system of education we see today.

Kahikū (1970–2017): Revitalizing Hawaiian Identity

Over the last 125 years of Western assimilation (following the overthrow of the Hawaiian monarch), Hawaiians experienced a massive loss and disconnection to their language, culture, and land. Education played a key role in the painful dismembering of the “native” within the Hawaiian. The acculturation process indoctrinated a Western mindset as the mainstream culture for which student standards of success were directed and measured. Hawaiians struggled to successfully navigate through an education system that was not responsive to their needs and fundamentally different in its valued individual driven system of the “me” over the “we.” As a result, focusing on a deficit model approach created gaping educational disparities among Native Hawaiians in academic achievement, school engagement, school retention, and graduation (Kawai‘ae‘a 2012; Kamehameha Schools 2011, 2014).

Kahikū is a new era beginning with the “Hawaiian renaissance” in the 1970s. It was period of cultural resurgence, a revitalization of the Hawaiian identity that through the last half a century has reawakened, reclaimed, and regenerated the Hawaiian maui (life force). It has been a journey of reaching back and bringing forward timeless traditional understandings in an “ancient is modern” application to revitalize Hawaiian identity that honors and cares for the welfare and well-being of its land, people, language, and culture (Kawai‘ae‘a 2012).

The Hawaiian Renaissance was a broad cultural movement that regenerated pride and aloha for those things Hawaiian. It gave rise to political activism which has led to deeper and more critical questions on Native Hawaiian rights, self-determination and political control over resources, rights and education in the 1980s and into the millennial. Kahikū, represents this significant period of time where Native Hawaiians have accelerated engagement with political power, economic solvency, social capital, cultural and linguistic understanding and application, and self-determined education (Meyer 2003; Wilson 1998; Kanahale 1982).

Mo'olelo: Narratives of Transformations in Hawaiian Education

The amplification of an “‘ohana mindset” built upon Hawaiian values, beliefs, perspectives, and practices has led way to new innovations that reclaim and reposition Hawaiian education as a valid, effective, and critical strategy for education. Four inspirational mo'olelo (narratives) in practice illustrate the transformational journey of Hawaiian education upon a strengths-based foundation for rebuilding vibrant and abundant communities.

Mo'olelo 1: Renormalizing the Hawaiian Language: Two Official Languages, Two Pathways of Education

Language is the piko (umbilicus) of the culture. Through language we express our worldview, thoughts, and connections to our past, present, and future. The 'ōlelo Hawai'i (Hawaiian language) movement has brought Hawaiian from the brink of extinction to increasing numbers of Hawaiian speakers, showing promising signs of healthy language shift across multiple generations. Wilson and Kamanā (2001) state, “Hawai'i has the most developed movement in indigenous language–medium education in the United States.” The story is an incredible testament to the strength of 'ohana, community, and government – to reawaken, reclaim, and regenerate – its invaluable cultural resource.

In 1978, the Hawaiian language became an official language of the State of Hawai'i. The new law served as a pivotal turning point for the Hawaiian language at a time of rapidly dwindling numbers of Native speakers into near extinction. Hawaiian was no longer the common language of the home, community, commerce, or education. Although Hawaiian was taught in a few high schools and at the college level, it was not producing enough proficient speakers of Hawaiian to sustain the language into the next generation.

Serving the community as a family-based education model, the first Pūnana Leo (language nest) Hawaiian medium preschool began in 1983. The Pūnana Leo schools became the launching point of what has been called the aukahi 'ōlelo Hawai'i (Hawaiian language revitalization movement). Kawai'ae'a et al. (2007) have explained that at the beginning of the movement there were fewer than 50 speakers of minor age children who spoke Hawaiian and an estimated 3,500 native kupuna speakers. The Hawaiian language movement grew out of a desire to bring Hawaiian back to the 'ohana – by focusing on the keiki (children) as the new generation of Hawaiian speakers. Through a 'ohana mindset, the desire of the 'ohana to bring the 'ōlelo (language) back into the 'ohana, mothers became the teachers and administrators and the families began to reestablish the 'ōlelo into the home.

In 1986, nearly one hundred years later, the 1896 law banning instruction in schools through Hawaiian was repealed. Public demand sent a strong message to reinstate Hawaiian medium education into public education. In 1987, the Hawai'i Department of Education (DOE) launched the Papahana Kaiapuni Hawai'i (Hawaiian Language

Immersion Program) as a pilot program beginning with the kindergarten–first grade on O‘ahu and Hawai‘i islands (Kawai‘ae‘a mā 2018).

Hawai‘i is in a unique position as the only state government in the USA to have two education systems – the Department of Education and the University of Hawai‘i system – housed within a single state structure. The DOE administers lower education from kindergarten through high school (K-12) grades. The University of Hawai‘i maintains the public higher education system through campuses statewide. The combination of lower and higher education levels creates a P-20 pipeline for options to learn “about, of and through” ‘ōlelo Hawai‘i. In 2015, Hawaiian language data reported 16,365 students of ‘ōlelo Hawai‘i registered in either ‘ōlelo Hawai‘i coursework – the learning “of” Hawaiian – and Hawaiian medium-immersion students – the learning “through” Hawaiian (SR 97 Working Group 2016).

In addition, public charter schools were created through state law as a venue for community control of education through independent governing boards under the State Public Charter School Commission. Both Hawaiian medium-immersion DOE and public charter schools are available as a viable option for students to learn “through” Hawaiian. There are currently 13 Pūnana Leo preschools and 24 Hawaiian medium-immersion DOE and public charter schools.

The Hawai‘i State legislature established Ka Haka ‘Ula O Ke‘elikōlani College of Hawaiian Language at UH Hilo in 1997 through Act 315. The college functions included laboratory schools, a language support center (Hale Kuamo‘o), Hawaiian medium teacher education, and Indigenous language outreach. The expansion of Hawaiian medium education into the tertiary levels provided a continued pathway for students to pursue degrees – bachelor to a doctoral – primarily through Hawaiian with support functions for Hawaiian medium-immersion P-12 schools.

It is important to note the timing of the Hawaiian revitalization movement occurred during a critical time in the decline of the Hawaiian language. The call to action galvanized families and communities creating new laws and policies to protect and support the Hawaiian language.

Beginning as a family-based community movement, Hawaiian medium-immersion education has expanded across both public and private education P-20. It is a viable option – a language renormalization platform – supported through law and education as two official languages, two pathways of education from preschool through doctoral degree programs.

Mo‘olelo 2: Reestablishing Hawaiian Education through Hawaiian-Focused Charter Schools

Established through public law Act 272 in 1994 (Hawai‘i State Legislature 2016), the State of Hawai‘i created the mechanisms that would, in 1999 through Act 67, allow for the establishment of twelve Hawaiian culture-based charter schools. These schools like Kanu i ka Pono in Anahola, Kaua‘i, Ke Kula ‘o Samuel Mānaiakalani Kamakau in Ko‘olaupoko, O‘ahu, Kua o ka Lā in Puna, Hawai‘i, and Kanu o ka ‘Āina in Waimea, Hawai‘i, were founded in communities across the

archipelago with high concentrations of Native Hawaiians. They were also founded on principles of culture-based education. Kana'iaupuni and Kawai'ae'a (2008) describe culture-based education as,

The grounding of instruction and student learning in the values, norms, knowledge, beliefs, practices, experiences, places, and language that are the foundation of a culture, in this case Hawaiian indigenous culture. Culture-based education may include teaching the traditions and practices of a particular culture, but it is not restricted to these skills and knowledge. More important, culture-based education refers to teaching and learning that are grounded in a cultural worldview, from whose lens are taught the skills, knowledge, content, and values that students need in our modern, global society. (p. 71)

Each K-12 school was designed to resituate Hawaiian pedagogical methodology within the unique environmental and cultural landscape in which it resides. For example, in 2001, Ke Kula 'o Samuel Mānaiakalani Kamakau, a Hawaiian language immersion school, entered into partnership with volunteer community members who were working to restore a 700 year old, 88 acre fishpond. Together, they designed and implemented curriculum and instructional strategies that empowered students to access 'ike kūpuna (ancestral knowledge), 'ike 'āina (knowledge of place and land), and contemporary knowledge systems to benefit the overall productivity of the fishpond, its surrounding geographic community, and its community of learners. Those approximate 30 students of Ke Kula 'o Samuel Mānaiakalani Kamakau were the first recognized contemporary learners to earn course credits in both science and social studies through 'āina-based education at He'eia fishpond (Paepae o He'eia 2016).

The early success of this integrated 'āina and culture-based model has had a noticeable impact on the proliferation of K-12 schools and their 'āina-based studies through fishpond restoration and management (Kamehameha Schools 2016). Today, more than 12,000 learners participate annually in educational experiences at He'eia fishpond alone (Paepae o He'eia 2016). It is estimated that another 20,000 learners engage in science, math, language, and social studies content entirely through culture-based fishpond experiences at more than 25 fishponds which have been reclaimed by volunteer community and 'ohana groups over the past 5–7 years. Like the fishpond restoration movement and the educational environments they have created, the inextricable connection between culture-based education and community 'āina-based resource management has generated learning opportunities in other traditional Hawaiian disciplines including voyaging and way-finding, hula and textile arts, and agriculture and ahupua'a-based management.

The Hawaiian-focused charter schools are part of an alliance called, Nā Lei Na'auao. They constitute 17 of the 37 start-up charter schools serving 4,200 students statewide. The Native Hawaiian enrollment is over 91% the highest in the state. Hawaiian-focused charter schools provide a critical base for student success and engagement as Hawaiian culture-based models that feature, interdisciplinary and interactive education, hands-on activities, project- and place-based learning, and multiage groupings. Curriculum, instruction, and assessment are culturally grounded through Hawaiian strength-based approaches that are also community-based

and culturally sensitive to student and family needs (Kanu o ka ‘Aina Learning ‘Ohana 2017). In fact, students of culture-based charter schools regard their kumu (teachers) as extended ‘ohana, and many of them frequently refer to school staff and faculty as Uncle and Auntie instead of Mr. or Ms. This formal reference to extended ‘ohana reinforces the kuleana (responsibility and privilege) between kumu, keiki (child), and makua (immediate parents) to nurture the well-being and potential of the keiki. The ‘ohana mindset continues to pervade Hawaiian-focused charter school curriculum, design, instruction, assessment, and operations. In addition to serving as proof points to spawn ‘āina-based learning in both rural and urban settings, Hawaiian culture-based charter schools serve as critical accelerators to reinvigorate comprehensive, whole person learning that is uniquely Hawai‘i.

Mo‘olelo 3: Reestablishing Hawaiian Education through Connection with Land, ‘Āina

At the core of ‘āina- and culture-based learning, as previously mentioned, is the *kalo*, Hawai‘i’s staple crop. As the ancestors planted *kalo*, they knew that from that one plant would emerge a bounty of new originations of *kalo* for future generations of people. Children learned that each generation of *kalo* was named and honored for its perpetual affect on the sustenance and survival of humanity. Through these teachings, a child’s education begins as they learn about the interconnectivity between one generation and the next and their specific responsibility to the past as well as the future. Adults also learn that, *maika‘i ke kalo i ka ‘ohā*, that our worth as mentors rides on the ultimate grounding and knowledge of our children.

Within the ‘ohana, positive relationships were at the core. To secure this form of positivity, individual roles and responsibilities were selected in accordance with individual strengths and abilities to fulfill the necessities of the entire ‘ohana. Thus, the betterment of the collective was the priority above individual need and desire. From this perspective, the ‘ohana maintained traditions and practices that galvanized the community and perpetuated the ability of the ‘ohana to function as a unit. Some of the major precontact practices of the ‘ohana Hawai‘i were fishing and farming. These practices were founded upon the physical, emotional, and spiritual connection of the ancestors to the ‘āina. Over the last 100 years, they have been a foremost catalyst by which ‘ohana have continued this relationship with our land and sea and have held the remnants of our culture together. Within our recent educational history, these practices have been the platform by which many of our cultural curricula have been built.

As a direct result of these curricula, Native Hawaiians have progressed through the last 30 years learning and teaching more about the land and sea. Many of our flora and fauna have been restored and revived through educational research, development, and praxis. This focus on restoration has led to the reconstruction of traditional farming sites and the religious structures that coincide with these practices. The aforementioned *kalo* has been reestablished as a staple food within Hawaiian homes through the vast cultivation within these rebuilt traditional farming

sites, or lo'i kalo. The most important outcome, however, of this reestablishment of 'āina-based education has been the reconnection of the next generation to a different expectation of education. New definitions of success are being adopted that are based on a more indigenous belief.

As lo'i kalo are established, new considerations also arise which affect the relationships between land and water. On the island of Maui, kalo farmers are battling sugar planters in hopes of establishing equitable water rights that no longer allow the re-directing of stream water from one area to another for big business. On the island of Hawai'i, activists battle for the establishment of a moratorium on the construction of telescopes on Mauna Kea without fully understanding its impact on the island's water table. As kanaka Hawai'i (Native Hawaiians) have continued the pursuit of a greater connection to land, so has the awareness increased about the interconnectedness of land, water, and kanaka.

Like the water that flows from Hawai'i's streams into the lo'i kalo, cultural connectedness and revitalization efforts have also reached the ocean and the propagation of fish. Many of Hawai'i's Hawaiian language and culturally focused schools have constructed curriculum that centers learning on our traditional fish propagation ponds, or loko i'a. Through the restoration of the fish ponds, kanaka Hawai'i learn about the innovation of the ancestors and the inherent effects of land management on the ocean. With this movement to restore native fish ponds, kanaka Hawai'i have been entrenched in the complex systems of traditional cultivation and the intrinsic political struggle that ensues to ensure the survival of traditional structures in a contemporary legal system.

At its core, Hawaiian education has spent a lot of time and space relearning the historical importance of our connection to 'āina. Students have learned from the 1970s how the 'āina has been mistreated while under foreign control. From the bombing of Kaho'olawe to the militarization of Makua valley, contemporary Hawaiian education has been charged with investigating native pathways to educate communities about land restoration and control. These pathways, ultimately, stem from the perspective of collectivity of 'ohana Hawai'i and our native desire to care for everyone and everything.

Mo'olelo 4: Reexamining Education and Policy: Advocacy for Improvement Through HĀ (Breath)

Courage is the backbone of indigenous struggle. In recent history, native courage has lead Hawai'i to some substantial achievements. Similar to the philosophy held within *Te Aho Matua*, a guiding framework for Maori language schools in Aotearoa, or the *Kumu Honua Mauli Ola* philosophy in Hawai'i, Hawaiian educators coalesced under the ideology that collective empowerment was the superlative avenue by which to achieve the most for our future generations (Horomia 2008; Ka Haka 'Ula O Ke'elikōlani and 'Aha Pūnana Leo 2009). One of the substantial achievements of this reformative shift in collective philosophy was the creation of the Office of Hawaiian Education (OHE). This office was a response to the rallying cry that

resounded from our communities to move towards native influence and ultimate control of our educational pathways.

The journey to this new office was an arduous one that started many years ago. However, the growth in recent years was an accumulation of policy changes that were initiated through collective activism. The primary catalyst that resulted in the ultimate inability of Hawai‘i’s state educational system to disregard Hawaiian educators was accountability. The Hawai‘i Department of Education (DOE) toiled through discussions with the Hawaiian language community about the State’s responsibility to native language revitalization efforts in a state with two official languages. These discussions basically spelled out for the DOE the fundamental issues of equity for both languages along with potential legal implications. From these discussions, the State DOE and Board of Education (BOE) also realized the significant desire of Hawaiian language educators to properly assess language programs with rigor.

This mo‘olelo (narrative) is a description of how collectivity brought our communities together. At this point, however, our sense of ‘ohana started to grow past our native communities and began to encompass members of the State’s system. These discussions built relationships of truth and honor. Inevitably, these relationships flooded out into other arenas and aspects of Hawai‘i’s system of education. The BOE established a committee to redraft the verbiage of the policies pertaining to Hawaiian education. The redrafts centered on common values and beliefs about education and, ultimately, provided a more secure foothold for our native efforts to thrive.

Concurrent to the policy redrafts, another movement formed within the Hawaiian educational community. Educators began to communicate and collaborate in ways that were never recounted before. During these summits, facilitated discussions unearthed the overwhelming yearning of our communities to normalize native language and knowledge. The native educators unified around the concept that natives in Hawai‘i deserve something different for our children that better reflect us.

Upon the solidification of these unified community strategic goals, the BOE responded by collecting influential native and nonnative educators together to design a new philosophy that would permeate the entire system. After a year of effort, this committee developed proficiency outcomes that affect all layers of system, from administration to students. These outcomes were adopted through BOE policy E-3 and called Nā Hopena A‘o, or HĀ (Hawai‘i Department of Education 2015).

HĀ: Culture-Based Learning

HĀ symbolizes the collective efforts of Hawai‘i’s native education community along with members of the State DOE to construct an educational experience for Hawai‘i’s youngsters based on our collective value of aloha. The characteristics HĀ honor timeless tradition relevant in contemporary contexts. The HĀ or BREATH components serve as underpinnings to ‘āina- and culture-based learning that is facilitated by Hawaiian-focused charter schools, Hawaiian language immersion schools, as well as a wide array of other public and private institutions from preschool through tertiary. HĀ’s six outcomes are:

- A Strengthened Sense of *Belonging*: I stand firm in my space with a strong foundation of relationships. A sense of *Belonging* is demonstrated through an understanding of lineage and place and a connection to past, present, and future. I am able to interact respectfully for the betterment of self and others.
- A Strengthened Sense of *Responsibility*: I willingly carry my responsibility for self, family, community, and the larger society. A sense of *Responsibility* is demonstrated by a commitment and concern for others. I am mindful of the values, needs, and welfare of others.
- A Strengthened Sense of *Excellence*: I believe I can succeed in school and life and am inspired to care about the quality of my work. A sense of *Excellence* is demonstrated by a love of learning and the pursuit of skills, knowledge, and behaviors to reach my potential. I am able to take intellectual risks and strive beyond what is expected.
- A Strengthened Sense of *Aloha*: I show care and respect for families, communities and myself. A sense of *Aloha* is demonstrated through empathy and appreciation for the symbiotic relationship between all. I am able to build trust and lead for the good of the whole.
- A Strengthened Sense of Total Well-Being: I learn about and practice a healthy lifestyle. A sense of Total Well-being is demonstrated by making choices that improve the mind, body, heart, and spirit. I am able to meet the demands of school and life while contributing to the well-being of family, 'āina, community, and world
- A Strengthened Sense of *Hawai'i*: I am enriched by the uniqueness of this prized place. A sense of *Hawai'i* is demonstrated through an appreciation for its rich history, diversity, and indigenous language and culture. I am able to navigate effectively across cultures and communities and be a steward of the homeland.

This historical summary not only tells of a movement to build stronger and more genuine relationships with each other, native to native, it also describes the powerful nature of native unity and courage. The courage to advocate for educational betterment has inspired the entire State system to examine the direction of education for future generations and rally around building a system that reflects our environment. Likewise, this unifying movement has encouraged native educators to determine the fundamental characteristics of Hawaiian education as well as decipher the aspects of Hawai'i that make these islands unique. Examination of key elements of our recent history allows us to properly construct our pathway into the future.

A Precursor to Keaomāmalama: Gathering Community Through Native Hawaiian Education Summits

In 1981, the United States Senate instructed the Office of Education (predecessor of the United States Department of Education) to submit a comprehensive report on native Hawaiians in education. This seminal report, *Native Hawaiian Educational*

Assessment Project (July, 1983), funded by the Kamehameha Schools/Bernice Pauhi Bishop Estate and submitted to Congress, found that Native Hawaiian students scored below other ethnic groups in almost every educational category and faced substantial challenges both in and outside of school that impeded their ability to do well academically (Kamehameha Schools/Bernice Pauhi Bishop Estate 1983). The report provided a compelling rationale for the federal government to provide financial resources to address these academic disparities. Then Kamehameha Schools/Bishop Estate Trustee Myron B. Thompson, after meeting with other native Hawaiians, considered a second intent of the report – to solidify a trust relationship between the federal government and the Hawaiian people, much like that established for American Indians.

In 1988, the US Congress passed the Native Hawaiian Education Act (NHEA) which focused on improving Hawaiian educational achievements in five distinct areas: preschool, elementary (through curriculum development), special education, higher education, and gifted and talented. Subsequent legislation continued to recognize a trust obligation between the United States government and native Hawaiians. The Native Hawaiian Health Care Act of 1988 (reauthorized in 1992), the Department of Housing and Urban Development Reform Act of 1989, and the Native American Languages Act of 1990 are just a few of US Congressional legislation aimed at improving the welfare of native Hawaiians.

During this era, Hawai‘i’s Congressional delegation and educational community realized the need to convene and discuss those critical educational challenges facing Native Hawaiians and develop solutions to them. Since the early 1990s, six Native Hawaiian Educational Summits have provided educators and others from the community a venue to discuss and generate solutions to the most pressing of educational programs. The summits also allowed for presentations that vaulted Hawaiian pedagogy and theory, the primacy of ‘ohana in the educational process, and Hawaiian epistemology.

In April of 1993, the 2-day Native Hawaiian Education Summit (1993 Summit) convened, bringing together over 200 Native Hawaiian educators, administrators, parents, students, and community members. This opportunity opened access to data about the progress achieved under the Native Hawaiian Education Act during its first 5 years as well as updates on the 10 years following the Native Hawaiian Educational Assessment Project. Sadly, while some progress had been made in certain areas such as more Hawaiian entering higher education, in general, Native Hawaiians continued to lag behind their counterparts.

Among the priority recommendations issued forth from this first summit’s report it recommended the establishment of a “. . . Native Hawaiian Education Board to ensure quality, accountability, coordination and self-determination in all educational efforts for Native Hawaiians” (p. 10). In contrast to the 1983 report, the recommendations from the 1993 Summit focused on the strengths and assets found within the Hawaiian community. In the report’s introduction, it states (Native Hawaiian Educational Summit Planning Committee 1993; Native Hawaiian Education Council 2016):

The Native Hawaiian Education Summit is a critical step in the process of self-determination. . . . We must, as a native people, strive in the continuing pursuit of education and cultural and spiritual enlightenment—'Imi Na 'auao. . . [it] rekindles the light to guide the steps of our native people. We will continue to reconnect and recommit to the richness and dignity of our heritage, and with this inner strength, we will plan for the education of our people. With the ancestors guiding and anchoring our footsteps, the hope and vision of Hawaiian education is clear and limitless. (p. 6)

The 1993 Summit produced three significant guiding principles (in the order of priority):

1. The 'Ohana and Native Hawaiian Communities shall determine, shape, and guide the education of our people.
2. We shall establish an educational system which embraces, nurtures and practices our traditional foundation as embodied in our language, culture, values, and spirituality.
3. We shall establish an educational system which empowers Native Hawaiian people to be the contributors, active participants and leaders in our local and global communities.

In response to the recommendations which emerged from the 1993 Summit, Congress amended the Native Hawaiian Education Act in 1994 with the following provisions: extend its authorization through the year 1999; provide for the creation of community-based education learning centers within rural Hawaiian communities; and expand Native Hawaiian curriculum development, teacher training, and recruitment. It also authorized the establishment of the Native Hawaiian Education Council (NHEC) and Island Councils which had responsibility for collecting information on programs for Native Hawaiians in island communities across the State; improving such services; outlining a strategic plan to dispense federal funding; and preparing Native Hawaiian education status reports for Congress. Island Councils representing seven island communities were created as a working section of NHEC.

The 1997 2-day Native Hawaiian Education Summit included many of the participants from the previous event as well as new individuals who represented other parts of the broader Native Hawaiian community. At its opening ceremony, the Chairman of the Hawai'i State Senate Committee on Higher Education announced that the Hawai'i Legislature had approved the establishment of and funding for Ka Haka 'Ula o Ke'elikōlani, College of Hawaiian Language at the University of Hawai'i-Hilo. As the first indigenous language college in the USA, this landmark announcement galvanized the participants' resolve to build upon the strengths-based, self-determination priorities of the previous Summit. The 1997 Summit report voiced the belief that instead of operating from a Western educational mindset that disconnects family – the first educators in a child's life – from what happens in the classroom, the education Hawaiians receive should be grounded in the 'āina (land base) and 'ohana (family). The report strongly suggested the inclusion of everyone in a child's education because of their unique talents and strengths. When

approached in this manner, a student would apply what was learned in school and at home to fulfill her/his *kuleana* (responsibility) to family and community. The report emphasized positive, appropriate Hawaiian values and characterizations (as opposed to negative characteristics or stereotypes), the important role of the ‘ohana, acceptance of family-based holistic approaches, and community- and place-based learning.

The Creation of Keomālamalama

In 2013, sparked by the expanding Hawaiian Education movement, a planning committee with members representing major players in education (e.g., Kamehameha Schools, Office of Hawaiian Affairs, Native Hawaiian Education Council, State of Hawai‘i Department of Education Hawaiian Studies and Language Programs, ‘Aha Kauleo, ‘Aha Punana Leo, Halau Ku Mana) convened to create the 2013 Native Hawaiian Education Summit. This Summit provided participants an opportunity to understand Federal and State policies affecting Native education as well as devoted space and time for groups to engage in project work. For instance, the Hawaiian Language Immersion Program (HLIP) developed their Strategic Plan, a Board of Education (BOE) member led a feedback and discussion session on the revised 2104 (Hawaiian language) and 2105 (Hawaiian studies) policies, and Hawaiian focused Charter Schools continued work on their indicator model. This section articulates the important events leading to the development of Keomālamalama – a group dedicated to improve Hawaiian education through a strong grounding in Hawaiian ways of knowing, believing, and being.

Following the 2013 Summit, the project work materialized with the approval and implementation of the HLIP Strategic Plan, adoption of the revised BOE 2104 and 2105 policies, establishment of the Office of Hawaiian Education (OHE) under the Superintendent of the State of Hawai‘i’s Department of Education (HiDOE), and a DOE contract with the University of Hawai‘i – Mānoa (UHM), College of Education (COE) to develop a Native Hawaiian assessment in language arts for grades 3 and 4. These landmark events contributed to advancing Hawaiian education, particularly in terms of native control over native education. Moreover, educational organizations and systems serving Native Hawaiians worked more collaboratively toward advancing culture-based and language immersion approaches.

Prior to the 2014 Summit, organizers from the previous year established several key Summit Outcomes: (1) celebrate the accomplishments of the past as foundational to current successes, (2) establish as a collective educational community the vision and goals for the next decade of work, and (3) ensure that community leaders were made aware of and had opportunity to respond to this vision and the accompanying goals. The goal was to gather educational leaders and critical community partners – kūpuna, mākuā, haumāna (students), kumu, and others – to create strategic goals for Hawaiian education that would be executed in 10 years. At the end of the 3 days, the participants of the 2014 Summit collectively agreed to the following vision, mission, and goals.

Vision Statement

'O Hawai'i ke kahua o ka ho'ona'auao. Hawai'i is the foundation of learning.

Mission Statement

Inā makahiki he 10 e hiki mai ana e 'ike 'ia ai nā hanauna i mana i ka 'ōlelo a me ka nohona Hawai'i no ka ho'omau 'ana i ke ola pono o ka mauli Hawai'i.

In 10 years, kānaka will thrive through the foundation of Hawaiian language, values, practices and wisdom of our kūpuna and new 'ike to sustain abundant communities.

Goal 1: 'Ōlelo Hawai'i – In the next 10 years, our learning systems will:

Advance 'Ōlelo Hawai'i Expectations.

Develop and implement a clear set of expectations for 'ōlelo Hawai'i that permeates all levels of education.

Actualize a Hawaiian Speaking Workforce.

Increase a prepared 'ōlelo Hawai'i workforce to ensure community and 'ohana access and support.

Amplify Access and Support.

Increase 'ōlelo Hawai'i context & programming to support the kaiāulu.

Achieve Normalization.

Pursue normalization of 'ōlelo Hawai'i.

Goal 2: 'Ike Hawai'i – In the next 10 years, our learning systems will: **Actualize 'Ike Hawai'i**

Increase use of knowledge from traditional and diverse sources.

Amplify Leo Hawai'i

Increase 'ohana and kaiāulu learning and participation.

Advance Hana Hawai'i

Increase resources to support practice and leadership.

Given the success of the 2014 Summit and participants' desire to remain connected to the Summit work and outcomes, the planning committee conducted a retreat to discuss its role and responsibilities to not only continue the Summits but also to systemically advance Hawaiian education. Held in Punalu'u, O'ahu in December 2014, members at this retreat explored answers to three essential questions: Who are we? Why are we doing this work? and What are our responsibilities? Retreat organizers realized that an opportunity existed to transition the group from an event planning committee to something more systemic and powerful. The setting and the activities were intentional; the 2-day discussion produced an emerging organizational construct that included a group identity, name, logo, purpose rationale, responsibilities, and organizational construct as well as joint commitments by all to establishing this new entity.

The process of naming in the Hawaiian culture – naming of a child, a group, an effort, and the like – involves several dimensions, processes, and understandings. For example, the process of naming this new entity was vital to its future validity and as such, had to be grounded in traditional processes.

Attendees took inspiration from their own education, life experiences, the surrounding place of Punalu'u, cultural framing, nā piko 'ekolu (value the past, act in

the present, for the future), dual concepts of *ao* (light) and *pō* (darkness), and the future impact of the work together. The result was the name Keaomālamalama. In its logo are beliefs and understandings about the entity's purpose (Fig. 4). Behind the logo's design are concepts like the center ban represents the idea of *mo'ō* worthiness – that in the stories are embedded the guides to effective, *pono* work; and *nā piko 'ekolu* – the three points of connection – represent past, present, and future generations impacted by this entity's work. The color green invokes thoughts of lush life, growth, renewal, and new beginnings while the added triangles at the top of the logo represent both *mauna* (mountains) and rays of light or *kukuna* of the various work that will be tackled.

As a working *hui* (group), members of Keaomālamalama have agreed to individually and as a collective: respond to the *kāhea* (call) of the work; commit to fostering and maintaining a strong foundation of trust; lead as servant leaders in service to the advancement of Hawaiian education; believe in the collective ability and power to have systemic impact; and dream, working toward and seeking new avenues to develop abundant, healthy people, and communities. Participants articulated that answering a “call” to the work and persisting through its realization will advance Keaomālamalama's vision and mission and, in the process, revolutionize education for Native Hawaiians. Together, we can generate collective impact that will sustain our young for years to come. Strategically, Keaomālamalama is set to: affect systems change via the Hawaiian Education movement; convene and collaborate (vs. implement) toward the realization of the 10- year strategic direction; define, drive, and be responsive to larger, system-wide landscapes educational, political, economic, and international; create spaces for families and communities to voice their *mo'olelo*; and support (vs. replace) other Hawaiian and educational organizations push to improve education for Hawai'i's young, especially in the case of native Hawaiians.

Operationally, the *hui* meets face to face at least once a quarter to organize, shepherd, and manage work, priorities, and upcoming events as well as focuses on identifying and reporting progress on key milestones and markers for the years leading up to the fruition of the 10-year vision. Members acknowledge that at its core, they must operate from a place of *pilina* (relationship) that is founded on trust and respect. To operate well, business is to be conducted in safe spaces that enhance and promote the synergy between all. There is common belief that all have strengths and critical connections that extended the ability of Keaomālamalama to advance Hawaiian education.

Directly after this retreat, work commenced to produce the 2015 Summit. Traditional wise sayings – *A'ohē 'ulu e loa'a i ka pōkole o ka lou* (There is no success

Fig. 4 Keaomālamalama
Logo

without preparation) and *Huli ka lima i lalo* (Add your hands to the growth of the māla) – framed this event and over 2 days, more than 300 participants engaged in facilitated conversations and interactive agreements to discuss their individual and/or organizational progress toward achieving the 'ōlelo and 'ike Hawai'i goals established in the 2014 Summit. They heard from four panels that contextualized the contemporary space within which Native Hawaiian education exists. The purpose of this Summit to determine as a collective a set of native-grounded cognitive/academic and noncognitive success indicators to be used by school systems to determine student growth. The collective ratified adoption of Nā Hopena A'o's six outcomes that were produced earlier that year.

Keaomalamalama's convening work continued by hosting the 2017 Summit in which the theme of *E lauhoē mai i ka wa'a; i ke kā, i ka hoe; i ka hoe, I ke kā; a pae aku i ka 'āina* (Everybody paddle the canoe together; bail and paddle, paddle and bail, until the land is reached) framed the continuing work of families and communities to advocate for and progress toward abundant and thriving communities.

Keaomāmalama is coming into its own as an entity whose mission is to advance Hawaiian education via its vision: *'O Hawai'i ke kahua o ka ho'ona'auao*. Hawai'i is the foundation of learning. The hui has the inevitable work of moving educational systems toward achieving this vision in the next eight-plus years without actual authority or substantive power and control to do so. It relies on native ways of operating that in turn becomes a beacon for other native Hawaiian organizations and individuals to not only follow suit but join in the forward momentum. There is much work to be done. But the strength of this entity is its ability to stay the course by trusting, joining hands with others, and keeping steadfast.

Kaulolo – Re-Empower the Hawaiian Being: Conclusion and Future Directions

Kaulolo – the graduating season – metaphorically describes the shine of the mid-day sun, which left no shadow on the graduate. The year 2017 represents this mid-day sun in the juxtaposition of the history of Hawaiian society and education and the voice of Hawaiian families and communities. Since the arrival of Cook in 1778, the metaphorical rise of American influences and impacts on Hawai'i and Hawaiians, map to an inverse decline in Hawaiian families and communities' political, societal, economic, cultural, educational, and familial power, voice, and overall well-being. In the kaulolo year of 2017, Hawaiian families and communities (i.e., graduates) have no shadow to impede realization of the Native Hawaiian education vision and mission in the next decade, despite the brewing storm of international, national, and state conflicts and threats to Hawaiian families and communities' beliefs and practices.

Indigenous Empowerment Theory (IET) has provided an indigenous framework for examining the historic transformations experienced by a native people. No longer is there need to rely on deficit theories that continue to label, disempower, and dominate indigenous ways of knowing and believing. This framework utilizes six catalysts combined with four eras to analyze the impact of public policies on native

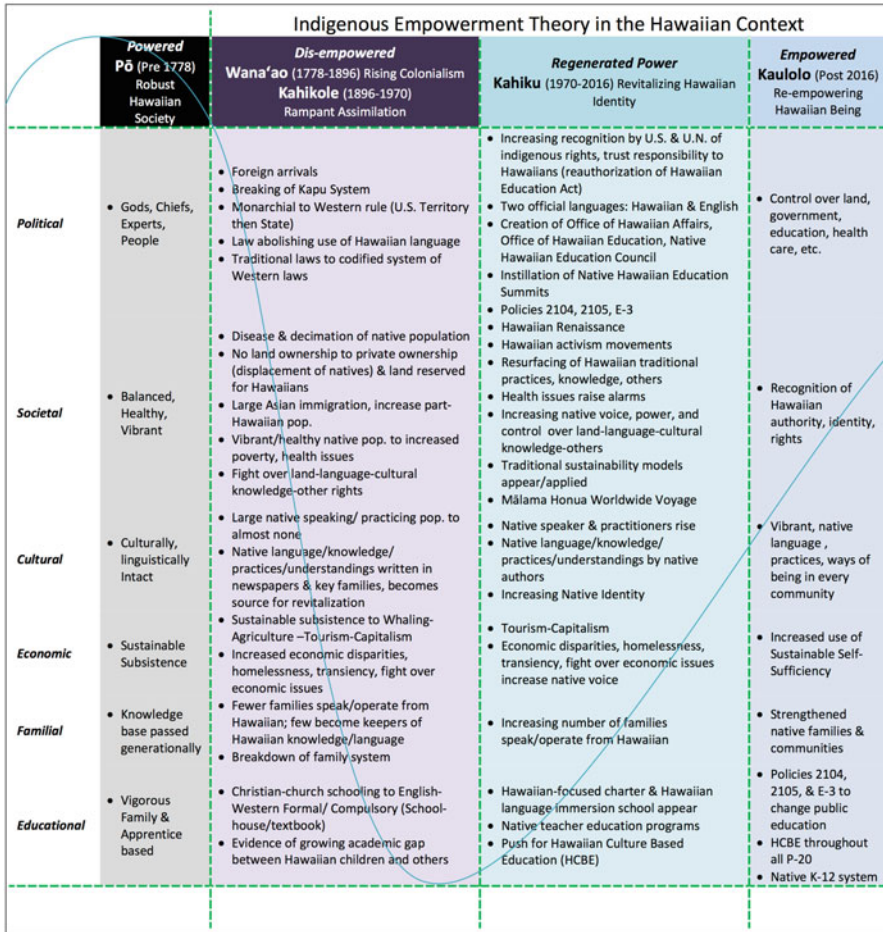

Fig. 5 Indigenous Empowerment Theory diagram

peoples over a large span of time (Fig. 5). For instance, it has helped the authors of this chapter to discover the influence of a century of United States’ nationalism on Hawai‘i and Native Hawaiians.

The authors of this chapter acknowledge that just as the confluence of these catalysts and eras led to where Hawaiians are situated today, they hope that the upward swing of power will produce a future where native Hawaiians control not only the education of their young but also improve the well-being of all. Merriam-Webster’s Dictionary (2016) defines the phrase *perfect storm* as: “a critical or disastrous situation created by a powerful concurrence of factors.” While 2017 may be viewed as a kaulolo (noon) era in the continuing transformation of Hawaiian society and education, it is a pivotal and punctuated perfect storm for Native

Hawaiians. At the confluence of growing awareness for the power of Hawaiians in their homeland, the authors of this chapter, also recognize the growing urgency to take control of the catalytic arenas – politics, society, economy, and education – by growing the importance of native culture, practices, language, and the like. It is through the mounting critical mass of amplified and shared voice which enables Hawaiians to have increased influence and power.

As recent history indicates, this strengthened voice and power appeared when Hawai'i's BOE passed policy E-3, Nā Hopena A'o (HĀ) in 2015. This public policy provides a step toward ensuring that public education in Hawai'i will be based on a set of Hawaiian values and outcomes. In addition, the creation of the Office of Hawaiian Education (OHE) in the Department of Education's Superintendent's office ensures that a Hawaiian voice is at the decision-making table.

As far as cultural and linguistic vibrancy, Hawaiian-focused public charter and Hawaiian immersion schools along with Hawai'i's tertiary education systems are growing the number of learners and their families who 'ōlelo Hawai'i (speak Hawaiian), actively operate from a Hawaiian way of being, and advocate for more funding and resources to expand culturally relevant, culture-based education. In turn, more work in the future on ways to recognize and affirm Hawaiian authority, identity, and rights will hopefully lead to increased vibrancy in Hawaiian communities. If Hōkūle'a's Mālama Honua worldwide voyage is an indication of a more robust Hawaiian identity, then all avenues that improve the sustainability of not only these islands but the entire planet will bring about self-sufficiency and well-being for its inhabitants.

In the next decade, Keaomālamalama seeks to fulfill its vision for Hawai'i – *'O Hawai'i ke kahua o ka ho'ona 'auao* (Hawai'i is the foundation for our learning) – by continuing to affect systems – political, societal, cultural, economic, and educational – transformation through the advancement of Hawaiian Education. Keaomālamalama will coordinate, convene, and collaborate with others so that its 10-year mission – *kanaka* will thrive through the foundation of Hawaiian language, values, practices, and *kupuna* (elder) wisdom and new *'ike* (knowledge) to sustain abundant communities – will be realized. Through the fulfillment of its two goals – *'Ōlelo Hawai'i* and *'Ike Hawai'i* – there is hope that Native Hawaiians will once again stand proudly and securely, empowered to control the next two centuries of transformation.

Over the last two generations, education has served as the vehicle to heal the cultural and linguistic trauma grounded through an 'ohana mindset to reconnect the ancestral voices, traditions, practices, and beliefs as the foundation from which innovation and transformation continue to flourish. Kawai'ae'a (2012) explains that Hawaiian education has served to, “shift educational paradigms and redirect the historic deficit model to a strengths-based approach— academically, social-culturally, emotionally, physically, and spiritually” (pp. 106–107). The work ahead is best described by Kana'iaupuni and Kawai'ae'a (2008) as a, “journey of rediscovery to reclaim an indigenous sense of well-being through the language, culture, values, and traditions; a groundswell that directs improved educational outcomes and school success for Native Hawaiians” (p. 68).

Moving into kaulolo, we envision a ‘ohana to ‘ohana educational system that begins with strong ‘ohana in the home and community and spans across the formal education system through college, into the workforce and back into the community. Towards kaulolo, we envision community and ‘ohana working together as a cohesive collective towards strengthening vibrant and resilient communities for future generations. While more Hawaiian families have risen out of poverty and homelessness, there are still many who are on or near the poverty line. The authors of the chapter realize that much more must be done to advance Hawaiian education and the wellbeing of its people. *Ua ao Hawai‘i ke ‘ōlino nei mālamalama*, Hawai‘i is enlightened, for the brightness of day is here.

Abstract

To successfully transform current notions of culturally responsive practices for Pasifika learners, teachers and educational leaders must move beyond practices that hinge on Pasifika learners adopting majority culture language, literacy, and identity in order to achieve academic goals. This chapter explores the process and outcomes of transforming education and schooling to better meet both the learning and cultural aspirations of Pasifika peoples in Aotearoa, New Zealand. A Pasifika metaphor of the *Va'atele* is offered as a framework for Pasifika learners' success in order that schools and educators might understand how it is possible to both privilege and utilize students' linguistic and cultural resources within curriculum learning at school. (*Va'atele* is the Samoan name for the ocean-voyaging double-hulled canoe of Pasifika peoples.) In this way, Pasifika learners can make meaningful connections between home and school funds of knowledge, and are able to experience success in both domains. We present evidence from two distinct but related case studies that draw attention to the central roles teachers and school leaders play in enabling Pasifika learners to connect, rather than replace, the worldviews, languages, literacy practices, and experiences of their homes with the valued knowledge and literacy practices of school. The enactment of linguistically and culturally responsive pedagogies raises students' linguistic and literacy achievement and acts as catalyst for the development of stronger connections between home and school domains.

Pasifika · Linguistically and Culturally Responsive Pedagogies · Va'atele Framework

Introduction

This chapter introduces the Pasifika metaphor of the *Va'atele* to reflect on and theorize the journey of Pasifika learners through the New Zealand schooling system as bilingual/bicultural people. Their journey is likened to the building, launching, maintenance, and sailing of the double-hulled deep-sea canoe (*va'atele* in Samoan, *ndrua* in Fijian, *tongiaki* in Tongan). The ocean voyaging of our Pasifika ancestors, or their *folauga* – their “navigational journeying” – is symbolic of Pasifika people's successful advancement through life. The people of the Pacific Islands are known as the canoe people and, for the Polynesian seafarers who sailed further to the east than any other people group, ocean voyaging was about survival, the search for land and food, for sovereignty, and the right to self-determination. Many of the migrant

parents and grandparents of the Pasifika learners in classrooms in Aotearoa came to New Zealand with the same aspirations as their ancestors – the desire for improvement and for a “better life” for their children (Si'ilata 2014).

The double hulls of the *Va'atele* are compared with the two worlds of home and school that Pasifika learners are navigating. One hull may be seen to represent the language, literacy, culture, and worldview of home, while the second hull is representative of the language, literacy, culture, and worldview of school. We argue that in the same way that the twin hulls of the *Va'atele* provide greater strength and safer passage through the unknown of sea voyaging, a culturally responsive environment that privileges bilingual and biliterate goals over monolingual goals are more likely to elicit effective outcomes. In order for Pasifika learners to be successful in the dual (and often multiple) worlds they inhabit, effective teachers should acknowledge, strengthen, and build students' capacity and capability in both (Si'ilata 2014).

The New Zealand Context

The twentieth-century migrations of Pacific peoples from their island homelands into English-speaking Pacific Rim nations such as Aotearoa New Zealand began in the 1950s. The main sources of migrant flows included the island nations of New Zealand's colonial administration, such as Western Samoa, Niue, Tokelau, and the Cook Islands. Pacific migrants were encouraged in order to meet the unskilled labor shortage of the 1950s and 1960s. The established connection between these Pacific Islands and New Zealand provided a sense of familiarity with the language and culture between both groups. They established lives for themselves within the towns and cities of New Zealand and, as others joined them over time, cohesive island-based communities were established. For many Pacific nation migrants, heritage languages and culture were maintained within the home and church, thus shaping their collective identities in relation to the wider society around them.

The Establishment of a Pacific Population

For much larger nations such as the United States and Australia, Pacific settlement has had a barely discernable impact on the population profile at the national or state level. In New Zealand, however, Pacific peoples are the third largest ethnic minority and are highly visible in the national socioeconomic indices. Pacific communities became established in New Zealand after World War Two with particularly significant levels of migration occurring in the 1960s to the mid-1970s. To illustrate, in the national census of 1945 there were 2159 “Pacific Polynesians.” Just over a decade later, there were 8103; in 1966, there were 26,271; and in 1976, this figure stood at 65,694 (Statistics New Zealand 1997). (The term used at the time to distinguish Pacific island immigrants from Māori, the indigenous Polynesian population.) Since the 1970s, the Pacific population has grown and become more diverse. Statistics

New Zealand and the Ministry of Pacific Island Affairs (2010) note that the current Pacific population is mostly young, urbanized, and New Zealand-born.

A number of factors account for the diversity of Pasifika peoples (Samu 2015). First, each Pacific group has unique social structures, histories, values, and identities although some forms of identity are not exclusive to any one Pacific cultural tradition. Two further significant features of New Zealand's Pacific population are worth noting here. First, a recent feature of this population is the growing proportion with multiple heritages or identities. (This stood at 37.2 percent in 2013 (Statistics New Zealand 2013).) Multiple heritages reflect growing levels of cross-cultural and cross-ethnic relations within New Zealand society. Second, of the seven largest Pacific heritage groups in New Zealand, three have more members living in New Zealand than in the home nation – namely, the Cook Islands, Niue, and Tokelau. The New Zealand resident communities of Cook Islands Māori, Niue, and Tokelau peoples have become critical locations of language and culture transmission, even revival, for their respective Pacific diaspora as a whole.

According to the most recent census, Pacific peoples in New Zealand form the third largest ethnic minority group (7.1% of the total population) after Māori (14.9%) and Asian (11.8%) (Statistics New Zealand 2013). Much of this population increase has been due to natural increase, rather than immigration. This accounts for why 62.3% percent of Pacific peoples are New Zealand born (Statistics New Zealand 2013). The Pacific population is very youthful with the median age of 22.1 years, compared to 41 years for the dominant European population (Statistics New Zealand 2013). Given the population now includes third and fourth generations of New Zealand-born Pacific peoples, this group can no longer be considered as an immigrant minority population.

There is a degree of variability in the formal terms used by different government institutions to describe Pacific peoples. What remains consistent, however, is the administrative practice of identifying the various groups, and their New Zealand-born descendants, under one broad category. For example, the terms “Pasifika peoples” or “Pasifika” are used by the Ministry of Education (2009b) while the Ministry of Pacific Island Affairs uses the terms “Pacific peoples” and “Pacific population.” (It is worth noting here that “Pasifika” is also used by the local government for the city of Auckland, which has the world's largest population of Pacific peoples. See: <http://www.aucklandcouncil.govt.nz/EN/AboutCouncil/Pages/Home.aspx>; See: <http://www.mpia.govt.nz/pacific-peoples-in-new-zealand/>) “Pacific peoples” is also the main term of reference used within the New Zealand Ministry of Health (<http://www.health.govt.nz/>).

The use of such blanket terms can unintentionally camouflage the distinctiveness of the different Pacific linguistic and cultural groups. A “vigorous if softly spoken debate” (Perrott 2007, p. 8) exists within Pacific communities about the use of terms with a pan-Pacific scope. In terms of education, Manu'atu and Kepa (2002) expressed concern for the learning needs of specific students (e.g., Tongan) because they are rendered invisible when grouped together under such umbrella terms. Samu (2015), however, stated,

Sometimes the main advantage of a unifying concept is the countering effect it has against oppositional forces such as neo-colonialism – or for migrant community groups such as Pasifika in New Zealand, countering oppositional forces such as assimilation and social/economic/cultural marginalisation. (p. 7)

The use of such blanket terms will continue to be problematic. That is why it is important for writers to explain whichever collectivizing term they have determined to use. Pasifika Education is the term used in the remainder of this chapter to refer to the education and development of the Pacific diaspora resident within New Zealand.

The Position of Pasifika Languages, Cultures, and Identities

For many Pasifika peoples, the movement away from home represented acts of betterment for both individuals and their families. It was a movement made in the collective belief that the social and economic prospects of both those who remained, and those who left and resettled elsewhere, would be enhanced. The broader macrolevel process that enabled such transnational movements of labor has been explained as the political economy of labor migration (Ongley 1996). Hauofa (1993) described it as the process of “world enlargement” – the deliberate and purposeful extension of the scope and reach of Pasifika extended families. For most migrating Pasifika peoples, there was no intention to cut off all ties with home, or, conversely, to wholeheartedly assimilate into the host nation. Concerted effort was made to maintain their respective languages, cultures, and identities.

The transmission of language, culture, and traditional forms of identity on to the next generation was more problematic. Pasifika migrants tended to locate in the same suburbs, find employment in similar areas of the labor market and often worship in heritage island groups, in their traditional languages. Their children were exposed to wider influences, including the powerful process of state schooling. Tongan American educator-activist, ‘Anapesi Kaili (2012), while speaking of her experiences in the US context, also describes the overall consequences of Pasifika children’s exposure to mainstream education in New Zealand:

We have criticized them for not knowing their language and culture, yet we don’t take the time to teach it. I have been in numerous meetings where administrators and teachers clearly do not see a need for multiple histories or epistemologies or anything that is not in par with mainstream culture and values. Yet, the minute our young people show any sign of resistance in this mainstream classroom they are labeled as having a behavior disorder, tracked into ESL and special education courses and their Pacific cultures blamed for their so-called failures. The same culture that they are not allowed to practice or even emulate. The same culture that they hardly even know!

The influence of state schooling was to have a powerful impact on the language, culture, and identity of migrant children and the subsequent New Zealand-born generations.

Framing Pasifika Education

Many Pasifika children in the 1960s and up to at least the mid-1970s experienced the kind of schooling that delivered a Eurocentric school curriculum (MacPherson 1996) where teachers advised their immigrant Pasifika parents to speak only English to their children at home (Anae 1998). However, the current schooling situation in Aotearoa, New Zealand, while not perfect, contrasts significantly with those earlier times. Both policy and practice reflecting cultural responsiveness of curriculum and pedagogy emerged in the late 1970s and 1980s, due to the influence of multicultural theories and ideologies (Coxon et al. 1994). Such changes signaled a state-influenced shift away from a Eurocentric education system toward the recognition and inclusion of minority languages and cultures in the curriculum. The only directive from the Ministry of Education, in terms of the education of Pasifika learners, was via the social studies curriculum in which a Pacific-centered topic was to be taught at least once every 2 years across both primary and junior secondary schooling levels (Samu 1998). This was to change remarkably from the mid-1990s onward and can be understood in three progressive phases.

Three Phases in the Development of Pasifika Education

The first phase of state-funded and -directed programmes of research and development that influenced, rather than deliberately targeted, Pasifika learners commenced in the late 1990s. The impetus was low-performing schools located within “two of New Zealand’s most entrenched areas of urban socioeconomic disadvantage and white/middle class flight” (Thrupp 1998, p. 198). Highly publicized debate merged as a consequence of a report in 1996 by the Education Review Office, which argued that chronic issues of low student attainment, truancy, poor teacher morale, and recruitment in these schools were caused by poor school performance. School and community leaders argued the issues were due to the sociopolitical context (Thrupp 1998). The majority of students in these schools were Pasifika.

The second phase was an intensification and consolidation of state funding in national policy, research, and development. The release of the Organisation of Economic Cooperation and Development’s (OECD) first Program of International Student Assessment (PISA) results in 2000 accelerated this process. New Zealand student performance was both exemplary and concerning. Those students who performed poorly were shown to be disproportionately Māori, Pasifika, and children with special needs (Alton-Lee 2005). This international measure of literacy and numeracy positioned New Zealand as having the second largest gap in terms of equity, of OECD member nations. It led to Pasifika targeted systemic change and development by the MOE including: the first 5 year Pasifika Education Plan; the first comprehensive literature review of research on Pacific education and the development of the nation’s first Pacific Research Guidelines – a document defining Pacific research in general, and ethics of good practice (Anae et al. 2002).

The third, and current, phase is characterized by a reduction in research and development contracts and a significant increase in professional learning and development (PLD) projects, informed by the evidenced-based research outcomes of phase two. The Ministry of Education identified three key priority learning groups: Māori, Pasifika, and children with special needs. This has become so much a part of the language of practitioners within the compulsory education sector, that the terms Māori, Pasifika, and special needs are often dropped. “Priority learners” on its own is sufficient for researchers, practitioners, and policymakers alike to know which group is the focus.

The rich and comprehensive research carried out over these three phases has established that for Pasifika learners, culturally responsive pedagogies are of crucial importance and at the heart of such approaches, are responsiveness to Pasifika cultures, languages, and identities. The major professional challenge for teachers is to manage simultaneously the multifaceted strengths and learning needs of Pasifika learners. Quality teaching is seen as a key influence in attaining high-quality outcomes for Pasifika students at all levels of learning (Alton-Lee 2003).

What Constitutes Pasifika Success?

Success for Pasifika peoples and their children should be considered holistically, relative to the multiple worlds they live in. Generally for Pasifika communities, academic success is not only about the success of the individual but is also reflective of the success of the family and the community from which they come. To be deemed fully successful in Pasifika contexts, Pasifika children are encouraged to strengthen and build capability in the “valued knowledges,” and “ways of being” of their family/community domains, as well as the valued knowledge of school. Ideally, success achieved in one domain should have benefits or “capital” in the other domains in which learners are socialized.

Transformative education that enables Pasifika learners in classrooms in Aotearoa, New Zealand, to see their languages, cultures, and identities represented in the “valued knowledge of school,” and to be utilized as a normal part of language and literacy learning in their classrooms suggests that their perceptions of success will include, rather than exclude, their linguistic and cultural identities. The continued development of Pasifika languages and literacies not only enables learners to be successful in the worlds of their families and communities, but also has direct impact on their successful acquisition of English language and literacy (Baker 2011; Cummins 2008).

Pasifika Languages Policy

The New Zealand Ministry of Education’s current policy stance within English-medium education focuses on the learning of “additional” or “new” languages, under the “Learning Languages” learning area of the New Zealand Curriculum (Ministry

of Education 2007), rather than on supporting community language maintenance of languages: “Learning a new language extends students’ linguistic and cultural understanding and their ability to interact appropriately with other speakers” (p. 24). Included are international “high status” languages, and some Pasifika community languages, including Cook Islands Maori, Niuean, Samoan, and Tongan taught as separate curriculum subjects to “new learners” of that language. Although the Learning Languages learning area states that Pasifika languages have a special place “because of New Zealand’s close relationships with the peoples of the Pacific” (p. 24), the reality in many schools with high numbers of Pasifika students is that they are given no greater (and sometimes less) prominence than languages such as French, German, Mandarin, and Spanish.

Within English-medium education, the Ministry of Education promotes the utilization of family language resources to support successful transition to English. There is minimal systemic support for ongoing Pasifika language maintenance, or for biliteracy development through Pasifika bilingual/immersion education. As stated in a 2014 Ministry of Education (2014) “request for proposals” for teacher PLD in the utilization of dual language texts in English-medium education, “Teachers need to build on all of the Pasifika children’s language knowledge, skills and experiences to support English language learning and literacy” (p. 6).

In 2015, 47 schools offered Pasifika bilingual/immersion education including 32 primary schools, 14 secondary schools, and 1 composite school. Sixty-six percent of those schools (31 out of the 47) were in the Auckland region, with Samoan being the most common Pasifika medium of instruction. Thirty-five out of the 47 schools delivered curriculum through the medium of Samoan, and ten schools offered bilingual/immersion education in two or more Pasifika languages (Education Counts n.d.). The provision of Pasifika medium education is the result, in many cases, of community concern about language loss, and of goodwill toward the maintenance of Pasifika languages, on the part of schools. Language shift and loss among New Zealand Pasifika communities are occurring at an alarming rate. Concerns about Pasifika language loss have been expressed within educational forums for many years: “According to New Zealand Census data (2006), all Pasifika languages in the Realm of Aotearoa New Zealand are showing significant signs of language shift and loss” (Post Primary Teachers Association 2010, p. 1).

Historically, the Ministry of Education has provided Pasifika language texts (Tupu Readers) in the five main language groups of Reo Maori Kuki ‘Airani (Cook Islands Maori), Vagahau Niue (Niuean), Gagana Samoa (Samoan), Gagana Tokelau (Tokelauan), and Lea Faka-Tonga (Tongan); online support through the LEAP – Language Enhancing the Achievement of Pasifika website (McComish et al. 2008); language learning material for new learners of those languages, but not necessarily speakers or members of those speech communities (Ministry of Education 2009a); and PLD provision for Pasifika bilingual teacher aides (Ministry of Education 2007; Si’ilata 2007). However, there is currently no further development of instructional reading material in Pasifika languages to enable biliteracy development within the schooling sector. It is necessary, therefore, to consider notions of

“Pasifika success” within English-medium education, where the majority of Pasifika learners are schooled.

Biliteracy Development

Pasifika bilingual learners are able to draw on language resources that include their receptive and productive capabilities in their Pasifika heritage languages, as well as a repertoire of sociolinguistic registers in their English language proficiency. When students are supported to access their common underlying proficiency (Cummins 1980, 2000), their bilingualism, biliteracy, and academic development can develop simultaneously rather than sequentially (Baker 2011; Garcia 2009). The implications of the common underlying proficiency construct require teachers to actively *teach for transfer* of linguistic, metacognitive, and metalinguistic knowledge. The theoretical rationale for this teaching for crosslinguistic transfer originates from several sources. Hornberger (2003) first proposed that both literacies are interconnected in the unconscious mind of the learner, cannot be separated, and have to be viewed as a single biliteracy system. This means that rather than ignoring what students know in their heritage language, teachers in English-medium contexts should draw on, make links to, and build on students' language, literacy, and curriculum content knowledge in their heritage languages and show students how to transfer skills, strategies, and content learned in English to their other language (Cummins 2007, 2008, 2011).

In English-medium and bilingual classrooms, the “monolingual principle” has dominated, meaning that students' first languages are often ignored and are kept rigidly separate from the learning of English and content (Cummins 2008; Si'ilata 2004). Cummins argues that when educators are freed “from exclusive reliance on monolingual instructional approaches, a wide variety of opportunities arise for teaching bilingual learners by means of bilingual instructional strategies that acknowledge the reality of, and strongly promote, cross-language transfer” (Cummins 2008, p. 65). In order to achieve biliteracy within bilingual or immersion classrooms, teachers need to make strategic use of the first language resource to support second language acquisition.

Many researchers in the area of language and literacy development emphasize the importance of utilizing learners' linguistic and cultural resources in teaching and learning interactions in schools. Dickie (2010), for example, described the “out of school” literacy experiences of Samoan children “reading passages of the Bible aloud with perfect accuracy; and *tauloto*, which are passages from the Bible to be memorised” (p. 25). Dickie argued that Samoan church literacy practices maintained a strong focus on comprehension, as well as memorization, and that being informed about these practices could enable teachers to link to and build on these strengths in their classrooms.

Subtractive bilingual contexts for Pasifika learners were identified by McComish et al. (2008), as being those where bilingualism is seen as a negative phenomenon in wider society; the learner's first language is not valued and encouraged, and is replaced by the dominant language (English). In these contexts, bilinguals will not

learn to use both languages extensively and are unlikely to have high proficiency in both languages (McComish et al. 2008, p. 17). These authors maintain that regardless of the language skills of bilingual (and other) learners, teachers should build on those competencies as a basis for further teaching and learning. They outline some key principles for teachers working with Pasifika learners. Two of the principles foreground the importance of creating opportunities for Pasifika learners to utilize their languages to support learning: “the languages that bilingual (or *Pasifika*) students bring with them are a key linguistic resource and a crucial foundation for their learning” and “Bilingual (or *Pasifika*) students learn better when they are able to use their first or home language at school” (p. 2).

The need for teachers to utilize linguistically and culturally responsive pedagogies when teaching Pasifika learners is highlighted in Chu et al. (2013) summary of Pasifika education research literature. Their findings revealed widespread consensus in New Zealand “that culturally responsive pedagogies are important to support learning but the focus of research in this area has been primarily on Maori rather than Pasifika” (p. 2), and that there is “growing evidence of the importance of teacher skills and understandings in culturally responsive pedagogies for enhancing educational outcomes for Pasifika learners” (p. 24). Not surprisingly, Ferguson et al. (2008) identified the need for further research and development, including responsiveness to the prior knowledge and experiences that Pasifika learners bring to the teaching and learning context and how this affects opportunities to learn.

Dimensions of Effective Practice for Pasifika Learners

Dimensions and indicators of effective practice for Pasifika learners were developed from the literature and from the research findings, and were used to analyze teacher practice. The dimensions included:

- Knowledge of Pasifika learners
- Expectations of Pasifika learners
- Knowledge of Pasifika bilingualism, second language acquisition, and literacy learning
- Instructional strategies, including Pasifika languages as resources for learning
- Pasifika connections with texts, world, language, and literacy knowledge
- Partnerships with Pasifika families/aiga and community knowledge holders

This set of six dimensions of effective classroom practice for Pasifika learners, each elucidated by two indicators, was used to consider all of the evidence collected and was then applied to the Va'atele Framework. The description of effective teacher practice described in the dimensions and elucidated through the indicators was developed primarily through a top-down process informed largely by the relevant research literature. However, these indicators were checked in a more bottom-up process against the practices of the effective teachers, who were known to be successful in promoting accelerated student achievement in literacy. The original

six “dimensions of effective practice” for learners in general are described in *Effective Literacy Practice in Years 1–4* (see Ministry of Education 2003, p. 12).

The six dimensions of effective literacy practice were modified to make them more specific to Pasifika learners and to validate the utilization of their linguistic and cultural resources within the New Zealand education space (see Table 1). These Pasifika-specific dimensions were used as the overarching framework for the analysis of teaching practice, and form the lens through which the data from teachers and the observations of their practice have been analyzed and the results articulated. The way in which teachers demonstrated the aspects of these dimensions are described in vignettes below.

Case Studies

The next section presents two illustrative case studies that report on interventions to Pasifika student achievement in English medium primary schools. Case study 1 introduces the Va'atele Framework as a metaphor for Pasifika success, with two of its indicators under the “connections” dimension being described through illustrative vignettes, in order to exemplify what effective teaching for Pasifika learners might look like in practice (Si'ilata 2014). Case study 2 provides a further illustrative narrative of one of the Va'atele dimensions: Instructional strategies, including Pasifika languages as resources for learning. It is based on research undertaken with year 1–2 teachers of Pasifika learners who participated in a professional learning and development programme that was focused on utilization of Pasifika dual language texts to support literacy learning at school. (The New Zealand Ministry of Education has developed Pasifika dual language texts in five Pasifika languages: Gagana Sāmoa, Gagana Tokelau, Lea Faka-Tonga, Reo Māori Kūki 'Airani, Vagahau Niue. See <http://literacyonline.tki.org.nz/Literacy-Online/Planning-for-my-students-needs/Pasifika-dual-language-books>) Initially, Samoan/English texts were piloted with Samoan children and were followed by the development of dual language texts in four other Pasifika languages. Teachers are now able to use specific dual language texts with different children, depending on their heritage language resource.

Case Study 1

The research in this case study was located in literacy teaching and learning practices in primary schools. The work in the schools was based on the six (generic) dimensions of effective literacy practice identified from the research and brought together in a resource developed under contract to the New Zealand Ministry of Education (2003, 2005). These six dimensions formed the basis for the Literacy Professional Development Project intervention, the research site for case study 1 (Ministry of Education 2003). The resource includes a section on the importance of teachers making links between learners' home and school contexts “in ways that are visible

Table 1 Dimensions of effective practice for Pasifika learners (Si'ilata 2014)

Dimensions of effective literacy practice	Dimensions of effective practice for Pasifika learners	Indicators
Knowledge of the learner	Knowledge of Pasifika learners	(1a) Teachers analyze and use English language and literacy data in their practice. (1b) Teachers analyze and use Pasifika home language data and family/cultural funds of knowledge.
Expectations	Expectations of Pasifika learners	(2a) Teachers set high, informed expectations for student learning which build on Pasifika learners' aspirations and values. (2b) Teachers build effective teacher-student relationships that focus on learning and build Pasifika learner agency.
Knowledge of literacy learning	Knowledge of Pasifika bilingualism, second language acquisition, and literacy learning	(3a) Teachers know about Pasifika bilingualism, second language acquisition, and literacy learning. (3b) Teachers use evidence from student data and from practice to design learning sequences, and monitor progress in relation to Pasifika learners' language and literacy needs.
Instructional strategies	Use of instructional strategies including Pasifika languages as resources for learning	(4a) Teachers explicitly teach English language and vocabulary by building on Pasifika home languages and oral practices. (4b) Teachers explicitly teach strategies for written language, including use of Pasifika literacy practices.
Engaging learners with texts	Supporting Pasifika connections with text, world, language, and literacy knowledge	(5a) Teachers support Pasifika learners to make meaningful connections with Pasifika cultures, experiences, languages, literacies, texts, and worldviews. (5b) Teachers provide opportunities for Pasifika learners to transfer knowledge, languages, and literacies from one context to another.
Partnerships	Partnerships with Pasifika families/aiga and community knowledge holders	(6a) Teachers collaborate with Pasifika families/aiga in identifying student learning needs and valued outcomes. (6b) Teachers build reciprocal relationships with Pasifika families/aiga and community experts to utilize their knowledge at school.

Adapted from 'The Dimensions of Effective Practice' Ministry of Education (2003, p. 12)

and significant for the child”(p. 117). For Māori and Pasifika learners, in particular, the writers suggested that this could be done by incorporating and building on familiar content in classroom practices, including “using texts that reflect the cultural values and perspectives of Pasifika students, building on Pasifika children’s expertise in recitation, developed through church and family literacy practices, by including recitation among classroom activities and by building on the concept of tuakana-teina relationships” (p. 117). It states further that teachers should encourage bilingual students to use their first language as a foundation on which to build their knowledge of English and that learning to read in their first language supports a child in achieving success with reading in a second language. Beyond these general statements, however, there is little in the way of specifics to guide teachers about how to do this.

The overarching purpose of this research, therefore, was to identify the specific actions of effective teachers of Pasifika learners in English-medium primary schools in Aotearoa, New Zealand, that led to acceleration of their language and literacy learning and achievement, and ultimately to the promotion of equitable outcomes and their success at school.

Methods and Data Sources

The study utilized a case methodology, supported by both quantitative and qualitative research methods in order to answer the research questions. The study itself developed out of the results of a prior literacy intervention where the lowest achieving students, including Pasifika learners, made the greatest progress: between 2.4 and 6.2 times the expected rate. Five effective teachers and five improvement teachers were identified and participated in the study over a 2-year period. (The five effective teachers were located in four “existing schools” that had joined the literacy project a year prior to the schools in which the improvement teachers were located. The effective teachers had already completed 1 year of professional learning when the Pasifika research began. They had reasonable numbers of Pasifika learners, and having produced accelerated gains, were selected as being among those particularly successful with Pasifika learners. The five “effective teachers” were chosen because of their Pasifika learners’ achievement levels related to those schoolwide gains. The five “improvement” teachers were located in three schools that were new to the literacy project in 2009. These “new schools” had considerable numbers of Pasifika learners and the school leaders wanted to address issues of Pasifika achievement. The improvement teachers were volunteers who were willing to be interviewed and have their practice observed.) The research questions posed in this study were focused on inquiring into four areas:

- Effective teaching of Pasifika learners
- Improvement of teaching for Pasifika learners
- Leader and facilitator actions that enabled improvement
- Leadership practices that promoted reciprocal partnerships between schools and their Pasifika communities

Results

The effective teachers taught in schools that showed higher effect size gains in reading than improving teachers' schools at comparable points in time on the intervention. The effective teachers' schools showed progress substantially above the usual rate, while the improvement teachers' schools took the first year to accelerate to the national average rate of progress, and almost doubled this in the second year. Similarly, in writing, the effective teachers' schools also had higher rates of progress. The rates of progress in writing among these schools were very high in all 3 years, with the large effect sizes most likely to be at least in part due to the very low baseline. Although the progress among the improvement teachers' schools was lower, progress was still around double the rate indicated in the norms.

Two illustrative vignettes are now described from the effective teaching section, including the theories of practice held by the identified "effective teachers" of Pasifika learners, with illustrations of their observed practice, supported by the voices of their Pasifika learners. Data relating to the effective teachers' theories and practices were obtained and analyzed through observations of, and interviews about classroom practice. The observed or reported practices of all case study teachers were described in relation to the dimensions and indicators of effective practice for Pasifika learners, with examples drawn from the observations of their practice at Times 1, 2, or 3.

Dimension 5: Supporting Pasifika Connections with Text, World, Language, and Literacy Knowledge

Indicator 5a) Making Meaningful Pasifika Connections

Kat was a teacher of a Year 1 class at School 2. She was particularly astute at supporting her students to make meaningful connections between their existing linguistic and world knowledge and the world of school. Her writing text purpose was linked strongly to her oral language programme and to the current topic focus, as well as having an authentic rationale that often included making connections with *aiga* (Family) and home. To illustrate: the literacy focus of one of Kat's lessons was persuasive writing and entailed students writing a letter to persuade their *aiga* to take them to the public library. Kat encouraged her students to connect their home funds of knowledge with school and to make school learning relevant and meaningful for home. Kat also made strong connections with her Pasifika learners through the use of their first languages as part of everyday communication in the classroom, rather than as "standalone" language lessons:

I use Māori and Pasifika languages because I guess it respects those cultures. . . and I quite like the idea of not just saying, 'Right now is the Māori lesson'. It is integrated and it makes things a bit more interesting. . . and the children really like it. They like learning a new word in Samoan or a new word in Māori. They like to say, 'Oh we learnt something new'. It's really good for children like Sione – me saying I don't know. . . but for the status to change and for me to be a learner and for Sione to be the teacher. It was really good for him to be the

expert and for me to say, 'You teach us what it is called', and you could see he was making all these little connections to do with 'fala', and I think things like that are really good to empower students.

Kat recognized the value of connecting with students' languages and experiences and focused on enabling students to make connections between their first language and their English language development:

On my door every week we have a word focus and we learn it . . . So every week we think of a word that we use at school and then we look it up [in our Samoan and Māori dictionaries] . . . The children are supposed to pick me up every time, like if it is 'book' and if I accidentally say book they are supposed to try and remind me that we are supposed to say 'pukapuka' or 'tusi'. I suppose it validates, I mean it is all really good learning because all the children are really keen to learn all these new words regardless of what their background is and it helps validate those Samoan speakers and maybe increases their sense of belonging. I bring it into topic work by looking, for example, at the verbs – what the Māori word and Samoan word for those things are and now it is set up. Yesterday at home time they all had to go and get their shoes and Student 2 just came up with 'Oh the Samoan word for shoes is 'se'evae' and we practised saying it altogether . . . by me initiating initially I guess they know that it will be encouraged and welcomed. So now it happens spontaneously as well with those boys. I can see them just kind of beaming with pride that they are teaching.

Kat's ability to enable her students to make meaningful connections and to transfer knowledge between their school and home lives by ensuring their language learning experiences and literacy products were significant in both domains meant that their literacy learning was relevant and authentic to their lived experience.

Indicator 5b) Transferring Pasifika Knowledge, Languages, and Literacies

This illustration provides an example of a Samoan teacher regarding her articulated knowledge of her students' home language and literacy practices and how she utilized that knowledge to create meaningful bilingual opportunities in the classroom to build her students' literacy in English. Va was a Years 5/6 teacher with predominantly Pasifika students in her class. She was cognizant of the language and literacy practices held by her Pasifika students, and believed that some non-Pasifika teachers held incorrect assumptions about Pasifika students' language and literacy capabilities and were not aware of the funds of knowledge held by them outside of school (Gonzalez et al. 2005):

I think we bring a lot of wealth and knowledge when we start school. You know a lot of teachers will say Samoans don't know how to read, they don't know how to write, but we have had our literacies forever and a day. We have our White Sunday, when our children learn their taulotos (memory verses) and have to read the Bible. So at five years of age we are learning how to sit down with Mum and Dad and learn John 3:16 "For God so loved the world. . .", and this is in Samoan. So I think the more teachers know about that and can make the time to find out a bit more about our children. . . the better teachers we can become. . . I think a lot of teachers group them and go, 'Oh he's a Samoan and all Samoans learn like this', or 'Tongans learn like this'. I'm not saying all teachers do that, but I think it is a mindset that is definitely out there and before we head in that direction I think we as teachers need to stop and let's just find out about the lives of our children because there's so much wealth;

there's so much that we can tap into, in relation to their successes. As professionals we have all these big discussions, what do we need to hook them in? Well let's find out about their backgrounds – what they know that is relevant to their worlds and then let's bring that in and celebrate it and look at it. Let's dissect it and analyse it in class: that is what we need to do.

Va described how she used Samoan to support teaching and learning, while at the same time creating opportunities for other bilingual learners to utilize their first languages. She focused on creating a classroom environment where learners' bilingualism was celebrated, encouraged, and “normalised”:

I don't ever stop using Samoan. I use it with my non-Samoan children as well. All my children know what 'Nofō i lalo (sit down), tu i luga (stand up), fa'amolemole (please), fa'afetai (thank you), tapuni fai toto'a (shut the door), tapuni fa'amalama' (shut the window). Cos I'll say it and then, 'I beg your pardon, that was Samoan for please sit down'. . . We do a lot of this in our classroom – I'll say the Samoan word is 'this', and then my Arabic child says – 'In Arabic it's this', my Sudanese child will say, 'It's this'. I'm no longer saying 'What's your word?' I'll say 'Great, can you come and write it up and she'll come and write it up in Arabic and we'll look at the letters, I'll say, 'Wow look at this alphabet, so different from ours.'

Va used her expertise adaptively by recognizing and connecting with the bilingual and biliterate skills that her Samoan students held in their total language resource. She determined individual students' language and literacy capability by utilizing her Samoan language with learners requiring first language support. She recognized that a learner's lack of proficiency in English did not necessarily equate to illiteracy. Rather she sought to ascertain, connect with, value, and utilize Pasifika learners' total linguistic and literacy resource in the classroom:

I speak Samoan to children who have just come straight from Samoa who have no idea of what is happening. So I try to explain it in Samoan as best as I can and if I could do it in any other language I would. I have one student in particular who has just come from Samoa this year. . . I will often give instructions to her in Samoan. I will explain a task to her in Samoan. I will even carry out testing in Samoan with her. I have done numeracy testing with her in Samoan and for running records I have prompted her and spoken to her before the reading in Samoan. . . I have found because this is the second year I have had my class, a lot of my New Zealand born children who last year wouldn't dare to speak Samoan have become a lot more comfortable in speaking Samoan in class. So that is fantastic. . . I just promote that it is nothing to be embarrassed about and it doesn't matter if your mum or your Nana can't speak English properly... So rather than mock and laugh, don't be embarrassed, be proud that you can speak two languages.

During the second observation of her teaching, Va had a major focus on the teaching of academic vocabulary and language features. She clarified the structure of a recount through a language experience activity by making three types of sandwiches to illustrate levels of weak to strong narrative writing. She implicitly used a Samoan communicative device (use of metaphor to make a point) that her students connected immediately to their knowledge of effective narrative writing. In Samoan oratory and discourse, the use of proverbs, metaphor, and subtlety in language are highly esteemed as forms of communication.

Although the teacher did not explicitly articulate to her students that she was using the sandwich making activity as a metaphor to demonstrate weak to strong models of narrative writing – they implicitly understood that that was what she was doing. They were able to independently describe what each sandwich represented:

- Va:* *We are thinking and we are talking about recounts and I want everyone to be thinking, ‘What could bread have to do with recounts?’*
- Student:* *The first bread is for the beginning – like the introduction and the last bread is for the conclusion.*
- Va:* *What do you think all my separate ingredients represent on my plate? My marmite, my jam, my peanut butter, my mayonnaise...*
- Student:* *They are all mixed up – like they are not in the right places.*
- Student:* *Lots of information but no order of events.*
- Va:* *Can you tell me why you said that Student 1?*
- Student:* *Because they are all mixed up.*
- Va:* *So what does this (other) sandwich show?*
- Student:* *The introduction and the order of events and the conclusion.*
- Va:* *Fantastic and this is what I wanted to show you. See all my ingredients here: did I just throw them all onto one plate and then throw them onto the bread?*
- Students:* *No.*
- Va:* *No I layered them one by one.*

Following the modeling and discussion of the correct structure of a recount, the teacher provided another opportunity “for authentic language use with a focus on learners using academic language” [ESOL principle 5] (Ministry of Education 2006), by reinforcing the learning gained from this “metaphorical” language experience. She shared a personal recount of her recent trip to Samoa for a family bereavement. The sequence was jumbled and students needed to collaboratively “un-jumble” it. She created opportunities for tuakana/teina pairings with “more able” students providing support to “less able” students to complete the narrative-sequencing task. Toward the end of the lesson, Va explicitly referred to one of the language features evident in recount writing: “metaphor” (which had been demonstrated previously through the visual language “sandwich making” experience).

- Student:* *She was like a sister to you?*
- Va:* *Yes absolutely, what sorts of words tell you that? You are right about “darkest”, anything else? Oh, “my heart was about to explode”. So what sort of word is it called when you say something like, “I couldn’t think or read, instead my heart and head felt like they were about to explode?” What is that called when you use language like that?*
- Student:* *A metaphor.*
- Va:* *And what does a metaphor mean again?*
- Student:* *It is something that isn’t real.*

Va: Right so a metaphor is like when something is going to happen but it can't really happen because my head and my heart can't really explode. Is there any other language in there that . . . shows you a metaphor?

Student: "The world stopped".

The teacher's willingness to share about her family bereavement created an authentic focus for her literacy teaching and meant that her students were fully engaged, because she had been absent for an extended time and they wanted to hear about her trip. The interactive language tasks enabled her Pasifika learners to draw on their own world and literacy knowledge and to use their explicit knowledge of the structure of a recount to write about a shared language experience (the weekend school gala) situated within their current class writing purpose. The purpose for the writing was authentic in that the teacher had not been present at the gala and wanted her students to provide her with an account of it.

In the final observation of her teaching, Va demonstrated strong practice in the explicit teaching of language and vocabulary and in making meaningful connections. She supported her Pasifika learners to make connections across writing purposes, using knowledge gained from the structure of a recount to inform their knowledge of the structure of an explanation. Va also seamlessly embedded the use of humor, within the body of her lesson, a practice perceived by students in the Pasifika Schooling Improvement project (Amituanai-Toloa et al. 2009) as being a strong motivational tool. They reported that students articulated that they preferred teachers who were organized, firm, clear, and demanding but also had a sense of humor. The importance of oracy underpinning literacy development and the value of strengthening reading/writing links was evident throughout the observations of Va's teaching where Pasifika learners were provided with multiple opportunities to work in communicative pairs or groups and to negotiate their understandings of academic vocabulary within meaningful contexts prior to writing.

Case Study 2

Dimension 4: Instructional Strategies, Including Pasifika Languages as Resources for Learning

Indicator 4b) Teachers Explicitly Teach English Language and Vocabulary by Building on Pasifika Home Languages and Oral Practices

The following case study is drawn from pilot research undertaken with year 1–2 teachers of Samoan learners who participated in a professional learning and development programme that was focused on utilization of Samoan dual language texts to support literacy learning at school (Si'ilata et al. 2015a, b).

The case focuses on what enabled teachers of Samoan children to change their beliefs and practices in relation to the use of Pasifika languages as resources for

learning. The preeminence of the role of pre-existing knowledge as a foundation for learning has been well documented by Bransford et al. (2000) who emphasize three requirements for effective learning: (a) engaging prior understandings, (b) integrating factual knowledge with conceptual frameworks, and (c) taking active control over the learning process through metacognitive strategies. The inquiry and knowledge building cycle from the best evidence synthesis on teacher professional learning and development (Timperley et al. 2007) connects strongly with Bransford et al.'s thinking about how people learn. The synthesis identified how cycles of teacher inquiry and knowledge building can improve learners' engagement, learning, and wellbeing. The stages of the inquiry cycle focus on teacher inquiry in order to meet student-learning needs: identifying valued outcomes and student learning needs; identifying professional learning needs; engaging in professional learning to deepen knowledge and refine skills; engaging in new learning experiences; and assessing impact and re-engagement in the next cycle.

In order for teachers to learn effectively, it is vital that their existing beliefs in relation to their students' learning are surfaced and engaged (Bransford et al. 2000). If teachers' existing beliefs about their students' ability to learn, and about what is important for their students' learning, are not surfaced and challenged, it is unlikely that they will engage in the next stage of deepening their pedagogical content knowledge because their existing beliefs may prevent them from doing so. In relation to their Pasifika learners, this would mean surfacing existing teacher beliefs and assumptions about the ways in which Pasifika learners learn, about what helps them to learn, about their families' aspirations for their learning, about their abilities and experiences outside of school, and particularly about their languages, family, and cultural backgrounds.

The overarching principle of the PLD program, encapsulated in each of the workshop underpinning principles and outcomes, was the *integration of home and school 'funds of knowledge' and utilization of Samoan children's total language and literacy resources (TLLR)*. This focus on utilizing Samoan children's funds of knowledge, rather than maintaining a focus solely on student needs as a basis for effective teacher PLD, meant that teachers were supported to view their Samoan (and other linguistically diverse learners) through an alternative and appreciative lens. Teachers were encouraged to engage in communicative bilingual approaches to language and literacy learning throughout the PLD programme, which prompted reflection on their current practice and classroom environment.

Teachers' Existing Beliefs

Before endeavoring to change teacher practice, it was first necessary to surface teachers' existing beliefs about how Pasifika bilingual children learn, and about what it means to "tap into students' funds of knowledge." Teachers needed to surface and understand their own tacit beliefs about the perceived value of making connections with bilingual students' funds of knowledge to support teaching and learning in the classroom. Through conversations with teachers during workshops, there was

evidence that some teachers knew little about the out-of-school lives and experiences of Pasifika children and their families. Some teachers expressed that they had previously taken a deficit view of Pasifika children's and families' lives and experiences, primarily their language/s, dialects, registers of English, and their particular literacy practices (for example, church literacy knowledge and practices). They were provided with opportunities to discuss how their beliefs about what works in classrooms for bilingual learners had been challenged, the impact on their practice, and the changed outcomes:

The bottom line is I failed this child and I have changed. Now I am really emotional about this because if I failed him how many other children have I? And I've noticed that every single one of my children is now moving... I was given two children that haven't moved at all in another class, and then I got them. They are now moving. And this has all taken part in the last month or so... It's happened. I am proof of that and I am such a happy person because of that... And often we think we know it all. Actually we don't. I used to think I was a damn good teacher and you woke me up on that day. I had to have a really good check of myself and my teaching practices and what was working and what wasn't, and how I could change it and to this day it has affected me so greatly...

Many teachers expressed that they already made connections with students' prior knowledge, but the connections made were often limited to a brief discussion about children's prior "world knowledge" prior to reading. A few monolingual teachers were making connections with children's existing linguistic or first language knowledge. Some teachers expressed the belief that it was better to keep the first language separate from the learning of English and that five-year-olds would get confused if teachers tried to teach more than one language at a time. This was a distinctly monolingual perspective/belief that was difficult to change, until teachers were put in the position of the language learner. Many teachers talked about an activity in one of the PLD workshops where they were prompted to read a Samoan text and engage in communicative tasks using the Samoan language, as new and challenging learning, highlighting for them the realization of the degree of oral scaffolding required in order to read and write in a language that they did not speak. This caused them to reflect on the experiences and challenges faced by bilingual learners in English-medium classrooms. It was apparent that teachers' beliefs needed to be surfaced and challenged prior to any change in practice:

The example with the reader about the airport and the picture on the front of the boy brushing his teeth and getting us to try and figure it out, because we couldn't access the words, what that story was about was a really neat eye-opener. Like that is how the kids have to process it, so it just put us in the shoes of the learners. So keep that example. That was really great.

They then understood the value of providing opportunities for their bilingual children to tap into their total language and literacy resource when reading English texts. Thus teachers' understanding of bilingual theory was enhanced by seeing it enacted in practice, through utilization of their own "common underlying proficiency"

(Cummins 2011), when reading Samoan. In effect, teachers understood to a greater degree the preeminence of prior linguistic, world and literacy knowledge, in enabling children to make connections with text.

In a PLD program focused on effective practice for Pasifika bilingual learners and the utilization of dual language texts in English-medium classrooms, it is necessary to surface and challenge teachers' existing beliefs before endeavoring to change their practice. Facilitators need to discover and understand teachers' current beliefs and practices about literacy for Pasifika students and their families, and to develop an environment that encourages critical, reflective dialogue, while also acknowledging the changes that are taking place in teachers' literacy pedagogical practice when responding to Pasifika learners and their families.

Teachers can learn to view linguistic diversity as a "total language and literacy resource" (TLLR) (McCaffery 2014) for learning rather than framing children's linguistic diversity as a problem to be addressed. Teachers should be supported and encouraged to explore Pasifika families' and children's resources, and to be willing to put themselves in the position of the learner, with Pasifika children and their families as teachers. Facilitators can support teachers to find creative ways of responding positively to the incorporation of Pasifika children's funds of knowledge within classroom teaching and learning programmes that synthesize well with their existing literacy lessons. Teachers should be supported to enact "owned" practices that build on the linguistic and family resources that Pasifika children bring to school, and to believe that when combined with effective second language acquisition (SLA) and literacy practice, this is the most effective approach to advance Pasifika learners' educational and literacy achievement.

Teachers Connected New Knowledge with Existing Knowledge

The workshops were run in a Pasifika way that synthesized Pasifika specific knowledge with effective second language acquisition (SLA – ESOL) and literacy practice, in order to draw on and make transparent and explicit "better practice" principles and pedagogies. Teachers were able to see how they might incorporate Pasifika, bilingual, and SLA practices within their existing literacy program. This was done by utilizing and practising Pasifika interaction and literacy practices, and connecting them with language and literacy learning, such as:

- Use of humor
- Storying and song
- Co-constructed and collaborative group tasks
- Tuakana/teina The tuakana-teina relationship provides a model for buddy systems. An older or more expert tuakana (brother, sister, or cousin) helps and guides a younger or less expert teina (originally a younger sibling or cousin) pairing (more able with less able Samoan speakers)

- Choral reading, memorization, and recitation in meaning focused literacy tasks
- Engaging in communicative tasks that required integration of receptive (input) and productive (output) modes in two languages

Teachers who were Samoan or who had specific language and cultural knowledge in relation to Samoan children and their families were acknowledged within the PLD context and were utilized as role models for language learning within the group. The PLD workshops for teachers encouraged collaborative inquiry where the facilitators, teachers, families, and children were “working together” (enacting in practice the meaning of the words: *Gālulue Fa’atasi* – the text series), inquiring genuinely into how teachers (and families) might utilize these texts with Samoan children in English-medium classrooms, where there were usually a range of ethnicities present. Some teachers claimed that they were now more open to utilizing children’s total language resource as well as family and cultural knowledge and experiences in the classroom. A number of teachers said that they had developed greater awareness about their children’s bilingualism and were now viewing it as a resource rather than a problem.

A number of (non-Samoan) teachers read Samoan texts with their students, by using digital sound files of the texts that provided models of correct pronunciation. Teachers supported their learners to connect their own schema with the schema in the book, and enabled them to utilize the text structure to tell and write their own bilingual digital stories using ipads:

[Teacher with new entrant five-year-olds creating their own digital stories about themselves using the dual language Samoan text as a structure]:

- | | |
|--------------------------------------|---|
| Teacher: | <i>Off you go, you guys carry on.</i> |
| Children: | <i>Yay! (Reading the story they have written on their ipad): ‘O la’u ‘ato ā’oga lea. Here is my school bag.</i> |
| Teacher: | <i>Okay do you maybe need to record that one again if you can’t really hear it?</i> |
| Child 1: | <i>You need to delete it.</i> |
| Teacher: | <i>Okay so delete that one. You guys have another go at the sound file.</i> |
| Teacher & child together: | <i>‘O la’u ‘ato ā’oga lea. (Here is my school bag).</i> |
| Teacher: | <i>Wanna play it and see what it sounds like?</i> |
| Children play their sound recording: | <i>‘O la’u ‘ato ā’oga lea. Here is my school bag. ‘O la’u pusa mea’ai lea. Here is my lunch box. ‘O la’u tusi lea. Here is my book.</i> |
| Teacher: | <i>Let’s see if they’ve got their sound file (plays the file). Awesome. You guys are way ahead. Let’s read it together (uses the digital text on the interactive whiteboard to read with students):</i> |

Teacher & children:	<i>What's this one? We can read this one; we're clever. 'O la'u tusi lea. And what does that one mean? Here is my book.</i>
Child:	<i>How do you know how to do it?</i>
Teacher:	<i>Because Mrs. Roberts has been practising at home!</i>
Child:	<i>Are you Samoan?</i>
Teacher:	<i>No sweetie, but I'm learning.</i>
Child 2:	<i>She's English. She's from England. . .</i>
Teacher:	<i>Yes, cos even though I'm a teacher, I never stop learning either. I have to go home and do homework too.</i>
Child:	<i>Cos you're a English. You're from England.</i>
Teacher:	<i>I am from England, yes.</i>

It was evident that the teacher's willingness to put herself in the position of the learner, to privilege the linguistic knowledge of the children, and to create opportunities for them to connect their Samoan linguistic and conceptual knowledge with their English language and literacy acquisition had a major impact on the children's willingness to utilize their linguistic resources at school. The use of their linguistic resources had a direct impact on their English language acquisition and on their biliteracy development. They were also prompted to consider their teacher's and their own linguistic and cultural identities as a result of reading dual language texts together.

The Va'atele Framework

The dimensions of effective practice for Pasifika learners were applied to the metaphor or model for Pasifika learner success: the *va'atele*, or double-hulled canoe. The analogy of the Va'atele Framework may be applied to Pasifika learners as they navigate their way through the education system, enabled by teachers and leaders who employ the dimensions of effective practice for Pasifika learners in their practice. These particular dimensions and indicators specify the teacher actions articulated metaphorically through the Va'atele Framework, by providing the combination of proven principles and practices to support learning in both school and home contexts. An analogy is drawn between each of the dimensions and the representative part they could be seen to symbolize in the *va'atele* (see Table 2).

Understanding the Va'atele Metaphor

To understand the metaphor in relation to Pasifika learners and their experiences at school, the double hulls and the voyaging of the deep-sea canoe are compared with

Table 2 Dimensions of effective practice for Pasifika learners applied to the Va'atele Framework (Si'ilata 2014)

Dimension	Indicators	Representative part of the va'atele
Knowledge of Pasifika learners	(1a) Teachers analyze and use English language and literacy data in their practice (1b) Teachers analyze and use Pasifika home language data and family/cultural funds of knowledge.	The hull/va'a of the va'atele as the foundation of the vessel – The uniqueness of the canoe is specific to the hulls and the knowledge of the builder to craft it according to the conditions in which it will travel.
Expectations of Pasifika learners	(2a) Teachers set high, informed expectations for student learning which build on Pasifika learners' aspirations and values. (2b) Teachers build effective teacher-student relationships that focus on learning and build Pasifika learner agency.	The mast/tila that connects the hulls/va'a with the sail/la, enabling it to withstand the strength of the wind and to act as a solid base from which to furl the sail.
Knowledge of Pasifika bilingualism, second language acquisition, and literacy learning	(3a) Teachers know about Pasifika bilingualism, second language acquisition, and literacy learning. (3b) Teachers use evidence from student data and from practice to design learning sequences, and monitor progress in relation to Pasifika learners' language and literacy needs.	The sail/la that enables the va'a to catch the wind – Combining the strength of the hulls/va'a and mast/tila, with the height of the sail, and the power of the wind to enable greater speed and success toward the journey's end.
Use of instructional strategies including Pasifika languages as resources for learning	(4a) Teachers explicitly teach English language and vocabulary by building on Pasifika home languages and oral practices. (4b) Teachers explicitly teach strategies for written language, including the use of Pasifika literacy practices.	The paddles/foe that are used by the paddlers to advance the va'a when there is no wind, and that use the water to generate the motion through which the va'a sails.
Supporting Pasifika connections with text, world, language, and literacy knowledge	(5a) Teachers support Pasifika learners to make meaningful connections with Pasifika cultures, experiences, languages, literacies, texts, and worldviews. (5b) Teachers provide opportunities for Pasifika learners to transfer knowledge, languages, and literacies from one context to another.	The platform/fata that connects the two hulls so that they sail as one vessel, enabling the progress made with one hull to benefit the other hull.

(continued)

Table 2 (continued)

Dimension	Indicators	Representative part of the va'atele
Partnerships with Pasifika families/aiga and community knowledge holders	(6a) Teachers collaborate with Pasifika families/aiga in identifying student learning needs and valued outcomes. (6b) Teachers build reciprocal relationships with Pasifika families/aiga and community experts to utilize their knowledge at school.	The keel/ta'ele running from stern to bow, which helps the va'a maintain its stability and straight movement despite the conditions – Keeping the va'a “grounded” and secure.

Pasifika learners' passage or journey through the schooling system as bilingual/bicultural people. Ideally, Pasifika learners would be in school settings that support the development of their bilingualism, biliteracy, and biculturalism, enabling success not only in the world of school, but also in the world of home and community. Pasifika families want their children to be successful at school while also maintaining strong identities that are grounded in the language and culture of the home. As explained in the introduction, one hull may be seen to represent the language, literacy, culture, and worldview of home, while the second hull is representative of the language, literacy, culture, and worldview of school. The platform/fata built over the two hulls is a bridge that helps to hold the whole *Va'atele* together, thus enabling the hulls/va'a to move through the water as one vessel, while also providing the stability needed to sail through any storm.

For Pasifika learners at school in Aotearoa New Zealand or throughout the Pacific, enacting the metaphorical double-hulled canoe (or linguistically and culturally responsive environment that privileges bilingual and biliterate goals over monolingual ones) is more likely to elicit effective outcomes than the single-hull metaphor – whether the single-hull be “English only” language, literacy and cultural knowledge, or a single-hulled Pasifika-only language, literacy, and cultural knowledge. In order for Pasifika learners to be successful in these two worlds, they need to strengthen and build capacity and capability in both.

The hulls/va'a of the *va'atele* were of equal size and were sufficiently stable to enable sailors to transfer supplies and people from one side of the *va'a* to the other. This reflects the role that schools, leaders, and teachers play in supporting their Pasifika students to connect with, utilise, build on, and transfer the existing “knowledges,” languages, and literacies of their families from home to school, with their role being foundational to the successful connections made between these two domains. The connecting platform/fata enables the stability, continuity, and progress of the whole vessel, with each hull/va'a supporting the other, and the vessel in its entirety. Similarly, leaders and teachers who are expert at supporting students to make connections between home and school knowledge, ensure that both languages and literacies develop and flourish, with the language and knowledge of home utilized to develop the language and knowledge of school which, in turn, is employed to further enhance the language and knowledge of home.

Conclusion

The demise of the Polynesian double-hulled deep-sea canoe, along with the decline of the knowledge and practice of navigation methods, occurred after the colonization of the Pacific by Europeans: “Canoes were replaced with European ships and some colonial governments introduced regulations restricting free movement between different administrative territories. The decline was so dramatic that theorists about canoe voyaging began to deny that Pacific journeys were possible” (Taonui 2012, p. 5). In more recent years, and partly to test such theories, replica canoes were built and sailed, with the Polynesian Voyaging Society of Hawai'i building the *Hōkūle'a* and completing a voyage to Tahiti in 1980. In 1999 and 2000, the *Hōkūle'a* sailed from Hawai'i to Easter Island and back, one of the longest and most difficult pathways sailed by Polynesian ancestors.

The demise and renaissance of the Polynesian double-hulled deep-sea canoe may also be likened to the demise of Pasifika languages and traditional knowledge throughout the Pacific and in particular in New Zealand, where Pacific migrant families have been encouraged since the 1950s to speak English to their children, and to clothe themselves with the accoutrements of the dominant culture, in order to be seen to be successful in their migrant home. Since 2012, however, the New Zealand Ministry of Education has acknowledged the need for teachers to be able to recognize and utilize the funds of knowledge and linguistic capital of Maori and Pasifika learners as a platform to scaffold learning in English-medium schools. Generally most English-medium schools do not have bilingual or biliteracy goals and, predominantly, tend to be English only language domains. In English-medium classrooms where teachers do endeavor to create opportunities for Pasifika learners to connect with and utilize their languages, literacies, and cultural resources, their profile might be more likened to the Samoan *'ali'a* (a later design than the *va'atele*, with one larger and one smaller hull). In English-only classrooms where Pasifika learners are given no opportunity to connect with or utilize their linguistic or cultural capital, their profile would more closely resemble a *paopao* (or single-hulled canoe, used for short trips only), lacking the stability, speed, capacity, and capability of the *va'atele*. Similar parallels can be drawn with Pasifika learners who no longer speak their languages, who are alienated from their island cultures, and no longer feel “at home” either in their Pasifika heritage, or in the “Palagi/European” heritage of the school. With the Ministry's acknowledgment that many schools still need to learn how to better connect with the worlds of their Pasifika learners, the following statement was published in the March 2012 Education Gazette, in relation to professional learning and development (PLD) provision:

All PLD providers must recognise and reinforce the central role that identity, language and culture play in learning. Research shows that this is an essential platform for lifting achievement for all learners, especially Maori, Pasifika, learners with special education needs and learners from low socio-economic backgrounds.

There is little evidence to date that PLD provision across the nation has had a focus or impact in this area, with doubts about whether PLD providers have the

capability themselves, specific to bilingual and biliteracy development for Pasifika learners. For the PLD providers that do have Pasifika facilitators, it is possible that the latter lack knowledge about the processes of second language acquisition and bilingualism (although they could well be bilingual themselves) or, alternatively, they are not in sufficient positions of power to drive systemic change in their respective provider teams, before endeavoring to change the beliefs and practices of leaders and teachers in schools. The 2013 Education Review Office (2013) report on accelerating the progress of priority learners in schools states that:

While different ethnicities were recognised, little was done to show that their identity, language and culture was valued and responded to. As schools develop their curriculum they should take into account the cultures, language, interests and potential of all their students. Maori and Pacific students below the standards were often subsumed into the more general group of under-achieving students, with no recognition of their particular identity, and no implementation of strategies likely to build on their cultural capital and promote success.

This chapter began by providing an overview of the educational landscape for Pasifika learners in Aotearoa, New Zealand, followed by an explanation of the Va'atele Framework and vignettes that illustrate two dimensions, as one suggested way to reframe Pasifika success in English medium education. The case studies illustrate three principles in relation to Pasifika learners' success at school. Through the development of inquiry-focused, collaborative, and success-oriented relationships, the following are possible:

1. Pasifika learners can be highly successful at school. Their utilization of language and literacy as interactive tools in meeting the demands of the curriculum is fundamental to that success.
2. Teachers can teach Pasifika learners effectively, and in particular ways that connect with and build on their specific languages, cultures, and identities, to meet the demands of the curriculum.
3. School leaders and PLD facilitators can support teachers in adaptive ways that enable them to improve their practice, and to utilize teaching and learning approaches that facilitate Pasifika learners' success at school.

Future Directions

Successfully enacting each of these dimensions and their indicators in the classroom with Pasifika learners was not solely the province of Pasifika teachers. These indicators were enacted in classrooms to varying degrees by the teachers involved in the research studies, with only two of the fifteen teachers being of Pasifika ethnicity (Samoan). The findings of this research illustrate that any teacher, regardless of ethnicity can improve their practice in creating opportunities for Pasifika learners to make the timely, meaningful connections that build on their languages, cultures, and identities in order to master the linguistic and cognitive demands of

school. Further research into the systemic structures and effective classroom practices that enable English-medium teachers to work in linguistically and culturally responsive ways to enable their Pasifika and (and other) linguistically diverse learners to utilize their bilingual and bicultural resources at school is urgently needed.

Abstract

The recent release of the Truth and Reconciliation's (TRC) Call to Actions in Canada has caused many postsecondary institutions to re-examine how they are providing educational services to Indigenous students. However, it is important to recognize that Indigenous peoples have been advocating for changes to the education systems for many decades. Drawing on personal and professional experience, the author focuses on transformative strategies that have been utilized to bring about a positive movement of change to support Indigenous learners at one postsecondary institution in the province of Ontario. It aims to capture the

notion that the work being accomplished today is rooted in the past and the present and recognizes the challenges and complexities of bringing about a sustained change.

Keywords

Indigenous education · Reconciliation · Transformative change · Organizational change

Introduction

What the Commission's Report tells us is that Canada is indeed in need of transformation, but that transformation is not of us. What is needed is for Canada to transform itself to embrace our true, share culture and history – to understand that we are all, in fact, in this together. (Fontaine 2015, p. viii)

With the recent release of the Truth and Reconciliation Commission's (TRC) Calls to Action (2015), more Canadians are now more aware of the devastating impact that the Indian Residential Schools had on the children who attended those schools. However, I am not so certain that the general Canadian population fully grasps the underlying colonial ideology upon which the residential schools were constructed and how colonial ideology still remains persistent in mainstream educational institutions today. The positive aspect is that there seems to be more attention paid to how various institutions can respond to the TRC's Calls to Action, including postsecondary institutions who are re-examining how they are providing educational services to Indigenous students. However, it is important to recognize that Indigenous peoples have always been concerned about the education of their people (Moeke-Pickering and Cote-Meek 2015). In fact, Indigenous educators, leaders, and communities in Canada as well as internationally have been advocating and pressing for an overhaul of the education system as it affects Indigenous students for decades (AFN 1988; RCAP 1996).

Drawing on personal and professional experience, this chapter focuses on describing transformative strategies that have been utilized to bring about a positive movement of change to support Indigenous learners at one postsecondary institution in the province of Ontario, which is located in central Canada. It aims to capture the notion that the work being accomplished today is rooted in the past and the present and recognizes the challenges and complexities of bringing about a sustained change. This case example is shared in the hope that it may be useful for other postsecondary institutions aspiring to respond to the TRC Calls to Action (2015).

Terminology

Before setting the context, it is important to clarify terminology used in this chapter. The *United Nations Permanent Forum on Indigenous Issues* utilize the following to describe Indigenous peoples:

there are more than 370 million indigenous peoples spread across 70 countries worldwide. Practicing unique traditions, they retain social, cultural, economic and political characteristics that are distinct from those of the dominant societies in which they live. . . [Indigenous peoples are the] descendants – according to a common definition – of those who inhabited a country or a geographical region at the time when people of different cultures or ethnic origins arrived. The new arrivals became dominant through conquest, occupation, settlement or other means. (Secretariat of the Permanent Forum on Indigenous Issues 2009, n.p.)

While not an explicit definition, the above provides a context for understanding who Indigenous peoples are. In Canada, the term Aboriginal peoples is used to describe First Peoples of Canada that includes First Nations, Métis, and Inuit. For the purposes of this paper, I use the term Indigenous to refer to First Peoples of Canada. This is not done to homogenize Indigenous peoples in Canada as there is much diversity in language, culture, tradition, and history. For example, there are 634 First Nations across Canada and over 50 different Nation and language groupings (AFN 2016). Despite these differences Indigenous peoples in Canada do share some common experiences with colonization and it is in this context that I use the term when referring to First Nation, Métis, and Inuit peoples. From time to time, I also refer to specific nations of people such as Anishinabek when it is appropriate to do so or when the literature uses other terminology to describe specific nations of Aboriginal peoples.

National Context

In order to situate the context of the current changes to postsecondary education as it relates to Indigenous peoples in Canada, it is imperative to lay out some of the important historical moments that have got us to where we are today. This section provides a broad overview of some key elements that have affected Indigenous education in Canada and more specifically the university system.

Residential Schools

Any discussion on the education of Indigenous peoples in Canada must include some understanding of the residential school system and the impact these schools has had. Residential schools were one of the central elements that the Canadian government put in place as a means to assimilate Indigenous peoples. Residential schools were one of the primary tools of colonialism and are now understood as one of the more known forms of violence perpetrated by white settler society on Aboriginal peoples. The impact that forced residential schooling has had on individuals who attended these schools, the resultant impact on Indigenous communities, and the generations following has been of grave concern for Indigenous peoples since their inception.

Briefly, residential schools operated for over 150 years. The first of these schools opened in 1834, the Mohawk of Institute in Brantford, Ontario (TRC 2016). One hundred and thirty-nine residential schools were established across Canada, all serving the central goal of assimilating Indigenous children. Children attending

these schools were not only separated from their families and communities for significantly long periods they were also subjected physical, psychological, and sexual abuse, which are now well documented (AFN 1994; Chrisjohn and Young 1997; Miller 1996; Milloy 1999). The impact of these experiences on the lives of the children who attended the schools as well as the generations that followed has resulted in longstanding and ongoing disparities in education, income, and health that have relegated Indigenous peoples to positions of inferiority in Canadian society. The impact has also resulted in the systemic marginalization and discrimination of Indigenous peoples from many aspects of Canadian life.

In the late 1960s, Indigenous peoples in Canada began a concerted effort to resist ongoing colonial and imperial imposition. This period of time was identified by the strong advocacy to bring about changes to the education of Indigenous peoples and was in direct response to the concerns about residential schooling and increasing pressure from the federal government on Indigenous peoples to assimilate and integrate into the fabric of Canada. In 1969, the federal governments' White Paper was introduced as a federal policy that aimed at full integration of Indigenous peoples and would essentially lead to extinguishing the collective rights of Indigenous peoples (RCAP 1996). In response, the National Indian Brotherhood (NIB), now named the Assembly of First Nations, launched a policy document *Indian Control of Indian Education* (NIB 1972). This policy was seminal in that it not only set the direction for Indigenous education but also reaffirmed Indigenous peoples' right to direct their education. Cote-Meek (2014) notes that this precipitated a new era for Indigenous peoples as they began making explicit efforts to regain control over their education and resist any further attempts at assimilation. The years that followed were marked by a heavy emphasis on the preservation of Indigenous languages, cultures, and traditions (Abele et al. 2000; NIB 1972). It was during this era that survival schools were established across the country (Barman et al. 1987). Postsecondary institutions were also affected by these changes, and in the early 1970s, the first Indigenous Studies departments were established in Canada, one at Trent University and the second at the University of Sudbury.

Apologies, Truth, and Reconciliation

In 2005 the Assembly of First Nations launched a class-action lawsuit against the federal government over the residential schools. This resulted in the Indian Residential Schools Settlement Agreement (IRSSA) that came into effect 2007, followed by the apology for the residential school system from the then Prime Minister Stephen Harper. It is important to note that the first in a series of residential school apologies actually came much earlier. The United Church, in 1986, apologized for their role in the colonization of Aboriginal peoples followed by the Missionaries of the Oblates of Mary Immaculate apology in 1991, the Anglican Church apology in 1993, the Presbyterian Church apology in 1995, and the United Church again in 1998 specifically for their role in the residential school system (TRC 2016). Further, the first formal apology from the Government of Canada actually came on

January 7, 1998, by the Honorable Jane Stewart, who was the then Minister of Indian and Northern Affairs (Government of Canada 1998).

Along with providing compensation to former students, the IRSSA called for the establishment of The Truth and Reconciliation Commission of Canada that included a budget of \$60 million over 5 years. The three commissioners, led by Justice Murray Sinclair, heard more than 6,750 survivor and witness statements from across Canada. On June 2, 2015, The TRC released 94 Calls to Action with the final report being released in December of the same year. The report itself documents and informs Canadians about the 150-year history of the residential schools through the voices of those who lived it (TRC 2015). The report titled *Honouring the Truth, Reconciling the Future* represents the testimony of more than 6,000 Indigenous people who suffered abuses in residential schools in Canada. The work of the commission has been pivotal in setting the national stage for change as several of the Calls to Action relate specifically to education.

There is no doubt that as far as Indigenous peoples are concerned systemic changes to the postsecondary educational are long overdue. In Canada, we are now witnessing waves of activity as institutions begin to respond to the TRCs Calls to Action. However, it is important to understand that larger transformative change has been occurring for some time now. As Moeke-Pickering and Cote-Meek (2015) state, “Generations of Indigenous leaders have accepted increased responsibility for transforming the educational landscape both in tertiary and academic institutes” (p. 2). Consistent with the push for self-determination and control, there has been what Graham Smith (2000) called a revolution occurring.

Canadian University Education Today

Despite the fact that Indigenous peoples in Canada have put forth a sustained and concerted effort for over 50 years to bring about changes to the educational system, Indigenous leaders, teachers, and community members feel that changes have been slow (Cote-Meek 2014). It is only more recently that serious attention to schooling including postsecondary education has received high profile attention, largely influenced by the 94 Calls to Action put forward by the TRC (2015). In the past 2 years, a momentum for change has been sweeping across Canada. Since the 94 Calls to Action were released, there have been responses across Canada from several universities on going forward. Further, Universities Canada (2015), an association with members from 97 universities from across Canada, has identified *Advancement of Indigenous education* as one of four priorities that they are currently committed to.

In addition, there have been a growing number of gatherings of postsecondary educators as many universities and colleges in various provinces have made public announcements of responding to the TRC Calls to Action. For example, the 2nd Annual Building Reconciliation Forum: Universities Responding to the TRCs Calls to Action was recently held in September 2016 at the University of Alberta. Laurentian University hosted Maamwizing Indigeneity in the Academy Conference in November 2016. This conference was designed to bring academics and community

members together to discuss important issues around three themes: Diversity in Universities – Equity in Hiring, Tenure, Promotion and Leadership; Ways of Knowing – The Place of Indigenous Knowledges in University curriculum; and Decolonizing Universities – New pedagogies, resistance, and reconciliation (Maamwizing 2016). These gatherings are extremely important in assisting with bringing about a systemic change as they provide platforms to discuss, dialogue, exchange critical information, and build strong linkages with Indigenous peoples and communities.

In a review of education and Aboriginal peoples in Canada, Cote-Meek (2014) identified three persistent themes that were important to understanding the current context of what Aboriginal peoples are confronted with when entering post-secondary educational systems. The first theme centered on the challenges with dealing the ongoing history of colonialism that is evident through persistent marginalization and racism. The second theme centered around understanding that the current structures of postsecondary institutions are colonial and this impacts how and what is included in the curriculum as well as who is privileged to teach the curricula. Third, despite the challenges that do exist with the educational system, education has always remained extremely important to Aboriginal peoples. In order to bring about a sustained transformative change, these three themes need to be addressed.

Without a solid understanding of the historical and ongoing challenges of colonialism within the educational system, any change will merely scratch the surface and more than likely be unsuccessful in the long term. Bringing this understanding to the forefront of postsecondary leaders has been no easy task. Most Indigenous educators can describe how challenging it has been to educate a whole system about the implications of ongoing imperial and colonial imposition on Indigenous peoples. It has been far easier to put the onus on Indigenous students as being underprepared or on focusing on the dysfunctionality of communities. While it is fact that many Indigenous lack adequate preparation to enter postsecondary education, the gap between Indigenous and non-Indigenous student success does not rest solely on Indigenous peoples themselves. There are systemic barriers that perpetuate this state.

As Justice Murray Sinclair has said on a number of occasions, “Education is what got us into this mess – the use of education at least in terms of residential schools – but education is the key to reconciliation” (Watters 2015, n.p.)

Transformative Changes in Education for Indigenous Peoples in Ontario

Transformative Change

Postsecondary institutions need to recognize that they are very much colonial structures. In fact, universities have not always been as open as they are today in terms of diversity and accessibility. Traditionally universities were largely elite institutions that provided higher education for a few. Mihesuah and Wilson (2004) note the problematic nature of the academy’s role in the ongoing colonization of

Indigenous peoples through maintaining control over access to knowledge as well as its production. Bringing about any sustained change therefore must also attend to this. Related to this is the imperative to understand that for Indigenous peoples, educational institutions have historically been placed where they are acutely aware of the challenges in negotiating their identity and place in the academy, both as professor and student (Cote-Meek 2014).

Watson and Watson (2013) note the role of higher education has been shifting from primarily traditional ivory tower models to institutions that espouse more universal goals that are more accessible and open to the entire population. This shift has created more institutions finding themselves responding to the diverse needs of peoples. Most universities now have diversity and equity statements as part of their missions.

However, several things must line up to bring about a systemic change to a system that has been embedded in the production of knowledge where access is limited to a small group of elite. Indigenous education leader Graham Smith (2000) describes transformative changes to Maori education since the early 1980s as being dramatic, innovative, and were the response “to the dual crisis of educational underachievement . . . and loss of language, knowledge and culture” (p. 57). Here it is important to note that transformative change can be in response to a crisis but that it is systemic. Smith (2000) further notes that the issue of underachievement of Maori in schools cannot solely be blamed simply as a Maori problem and that there are larger structural impediments that must be addressed. He notes, “Pakeha [non-Maori, many European New Zealanders] power and control can be exerted through selective decision-making, hegemonic influence, economic control and manipulation of resource allocation, exercising social and cultural preferences. . . all of which are conducted in a societal context of unequal power relations” (p. 62). Issues of power and control are also acutely linked to the larger Indigenous struggles for self-determination, which is similar to the state of education for Indigenous peoples in Canada. Both Smith (2000) and Grande (2008) similarly contend that education is at once political in that it should promote self-determination/decolonization, collective agency, culturally preferred pedagogy/Indigenous knowledge and articulate with Maori/Indigenous political, social, cultural, economic, and intellectual aspirations. Both assert that critical analysis of colonial structures and processes is critical to transformative change in education.

For the purposes of the next section of this chapter, I draw on the concepts of the Medicine Wheel to facilitate understanding of how systemic transformative change can and must be viewed within a holistic framework. The Medicine Wheel, also referred to as the Sacred Circle, has been described as a concept that “is one of singular unity that is dynamic and encompassing, including all that is contained in its most essential aspect, that of life” (Gunn Allen 1992, p. 56). There are tribal variations in how the Medicine Wheel is depicted but the central teachings of the circle include holism, balance, connectedness and relationships, and harmony (Hart 1996, 2002). Essentially these teachings are foundational for living one’s life within the circle of family, community, and society. Symbolized through the circle/Medicine Wheel, these teachings have been previously utilized to organize and frame curriculum (Graveline 1998), addiction recovery and delivery of services for

Aboriginal peoples (Nabigon 2006), healing (Hart 2002), opening and closing a research process (Moeke-Pickering 2010), and research (Baker 2016; Lavalleé 2008). Similarly I draw on these teachings to discuss transformative change.

Based on what I have learned over the years from my own Anishinaabe culture passed down to me from my mother, family, community, and Elders, each of the four quadrants or directions of the Medicine Wheel is symbolized by the four colors: yellow, red, black or blue, and white. Each of these has a series of teachings that relates to each of the directions. For example, there are four aspects to the individual: the physical, the emotional, the emotional, and the spiritual. Each of the four is represented on the circle and each aspect is considered integral to maintaining balance. The Medicine Wheel also frames understandings at the individual, family, community, and societal levels. In the section that follows I draw on the Medicine Wheel teachings of vision, relationships, reflection, and action to present a case example of how one Canadian University has been enacting transformative strategies in order to ensure it remains responsive to the Indigenous communities it serves. The purpose of utilizing the Medicine Wheel to frame this case example is to depict the holistic, inclusive, and all encompassing nature that transformative change entails.

Transformative Strategies at One Ontario University

This section provides a case example of how one Canadian University has been enacting transformative strategies in order to ensure it remains responsive to the Indigenous communities it services. These strategies have assisted with bringing about larger systemic changes that are consistent with the broader movement of Indigenizing the academy. I start with a brief description of the context in order to understand the university's history working with Indigenous peoples and communities. Transformative strategies are then discussed under the four directions of the Medicine Wheel utilizing the teachings of Vision, Relationships, Respect, and Movement. I start in the eastern direction of the Medicine Wheel with the teaching on Vision. However, it is important to highlight that the teachings of the Medicine Wheel also tell us that all things are in perpetual motion and while I describe the elements needed to bring about a transformative change starting with Vision located in the eastern direction and then move in a clockwise pattern to Relationships in the south, Respect in the west, and Movement in north, it is important to understand that the change is never linear and transformative change requires a number of things to happen simultaneously. The teachings of the Medicine Wheel also support that one can enter the circle at any point.

Context

Laurentian University is located in northeastern Ontario on the traditional territorial lands of the Atikemesheng Anishinaabek. The university has been in existence since 1960 and is considered a small to mid-size university with approximately 10,000 students. In the 2012–2017 strategic plan of the university, it identifies itself

as an institution delivering postsecondary university education in both English and French as well as with a comprehensive approach to Indigenous education (LU Strat Plan 2012–2017). Typically referred to as a bilingual and tricultural institution, Indigenous students represent about 10% of the total student population, which is also one of the largest Indigenous student population enrolled in an Ontario University. The university has a longstanding Indigenous Studies department that is located in one of its federated partners, the University of Sudbury, and also has a School of Indigenous Relations, which is home to the university's signature Indigenous Social Work program and the Master of Indigenous Relations program (Laurentian University 2016a).

East: Vision

Systemic change cannot happen without a clear sense of vision. Vision cannot be built in a vacuum nor can any sustained change. At Laurentian University, the vision for Indigenous education came from Indigenous peoples and allies, both internal and external. Active and meaningful Indigenous community engagement and participation has always been at the heart of initiatives at the university. Over the years, with the support of various faculties, staff, and senior leadership, the presence of Indigenous peoples on campus has grown to what it is today.

In the early 1970s, changes were largely focused on carving out academic spaces for Indigenous thought, history, and worldview in the emerging discipline of Indigenous Studies. These early efforts resulted in the establishment of two departments that have remained central to Laurentian University, the department of Indigenous Studies, and the School of Indigenous Relations.

The first departments of Indigenous studies (then called Indian Studies) were created at the University of Sudbury and Trent University in the early 1970s. The University of Sudbury, one of three federated institutes at Laurentian University, established an Inter-department program Amerindian-Eskimo Studies in 1971. This program was replaced with a Native studies program in 1976 and comprised of Cree and Ojibwe language courses and courses on Anishinaabe identity, religion, and culture. The following year, the Department of Native Studies was established and in 2013, the department was renamed the Department of Indigenous Studies. Today, the department offers full range of Indigenous studies courses that aim to promote an understanding of Aboriginal peoples, their traditions, aspirations, and participation in local, national, and international communities (Laurentian University Faculty of Arts 2015).

In addition, Laurentian University is home to one the oldest Indigenous Social Work programs in the country. This program was established in 1985 after an extensive regional consultation with Indigenous communities to determine community need for trained social workers (Alcoze and Mawhiney 1988). The Indigenous Social Work program (then Native Human Services) set up an Indigenous advisory circle to provide ongoing advice and direction to the program. These two departments built and sustained lasting relationships with regional Indigenous communities that have been maintained to this day.

In 1991, the provincial government of Ontario established the Aboriginal Education and Training Strategy to assist with addressing issues in postsecondary education with respect to Indigenous peoples. This initiative became a catalyst for

the development of programs and services across a number of institutions (Hill n.d.). Part of this strategy also called for institutions to established Indigenous advisory councils to oversee and provide direction on institutional Indigenous initiatives. As a result in 1991, the Laurentian University Native Education Council (LUNEC) was established and comprised of representatives from regional Indigenous communities, Indigenous staff and faculty, as well as institutional representation (Laurentian University 2016b). The mandate of LUNEC was, and continues to this day, to facilitate Indigenous self-determination by providing direction to the university on all matters relating to Indigenous education at the institution (Laurentian University 2016b). This advisory council remains very active. The council continues to set the vision for Indigenous education at the university, provides advice and direction to the university, and develops regular strategic plans that are focused on Indigenous community needs. Through the council, the leadership at the university has created a venue for Indigenous community engagement and meaningful participation.

After working with LUNEC broadly as an Indigenous faculty member since 1993 and more closely as the senior administrative lead on Indigenous education since 2006, it is my observation that this council takes its role seriously, recognizes the importance of their role in mobilizing the institution, and has always had at the forefront of its work, Indigenous students, and communities. LUNEC and Indigenous faculty and staff in the institution also recognize the importance of allies and have over the years built many strong lasting relationships with various senior administrators, faculty, and staff across the university. For example, the council now includes membership from the Board of Governors and Senate of the institution.

The latest strategic plan of LUNEC, *Niigaan Ninaabin, Looking forward to the future, 2013–2018*, outlined six strategic directions to support the broader LUNEC vision of self-determination of Indigenous peoples (Niigaan Ninaabin 2013). The plan is depicted through the Anishinaabe symbolism of the sacred circle, also referred to as the Medicine Wheel. The Medicine Wheel is a sacred symbol utilized by many Indigenous peoples to express a way of understanding the world around us. Therefore, the strategic plan developed by LUNEC is considered holistic in its directives. This plan was intentional and had measurable objectives that were to be implemented over a period of time.

As with any change, it is important to choose a starting point that makes the most sense to the both the context of the institution and takes into consideration the external environment. Watson and Watson (2013) point out that it is important to choose a starting point that will “make the greatest impact and build the most momentum to promote and sustain system-wide change” (p. 44). LUNEC chose to advocate for an Indigenous Sharing and Learning Centre, which became the first priority in their plan. As a result, any measure of success was based on the progress towards meeting this goal.

LUNEC also worked to ensure that their plan was aligned with the university’s overall strategic plan by ensuring that the Chair and at least one other Indigenous representative was a member of the university wide strategic planning committee. In 2012 the university adopted the Laurentian University Strategic Plan 2012–2017 that would have a historic six specific strategic directions relating to advancing Indigenous

education at the institution including increasing Indigenous student enrolment, creating effective signage reflecting the local Indigenous language, launching a new Indigenous Relations program, creating a dedicated physical space to support Indigenous students, increasing the proportional Indigenous faculty and staff, and increasing Indigenous content across disciplines (LU Strat Plan 2012–2017). The university strategic plan was also supported by an academic plan that also had specific actionable objectives relating to Indigenous education. The alignment of the Laurentian University Strategic plan, the Academic Plan, and LUNEC's strategic plan laid a solid foundation for bringing about institutional change.

South: Relationships

The early relationships with regional Indigenous communities were extremely important to building longer-term mutual trust and respect. For example, Alcoze and Mawhiney (1988) documented an extensive consultative process with regional Indigenous communities that pointed to the importance of listening and valuing community input. This was essential to building a program that would be different from the mainstream social work program that existed. Similarly, Moeke-Pickering and Cote-Meek (2015) note these relationships have sustained themselves over time and are now evident in the relationship that the university has with the Laurentian University Native Education Council (LUNEC). LUNEC is a presidential advisory council that was established 25 years ago which is currently comprised of regional and local First Nations and political territory organizations as well as local Aboriginal organizations. In addition, internal university representatives also sit as members of the council. Voting membership, however, rests with the external community and internal Indigenous student representatives. This council remains highly engaged and involved in the universities Indigenous education initiatives.

External community relations are also evident in partnerships that the university has established with various Indigenous community-based educational institutes and other educational partners. A good example of a successful partnership is the delivery of the Bachelor of Indigenous Social Work in two distinct areas of the province. The delivery of the program involved partnerships with two different Indigenous community-based educational institutes that were aimed at delivery of a university program to students who were unable to attend an on-campus program (Moeke-Pickering and Cote-Meek 2015). Lessons learned from the development and delivery of the Indigenous social work program are many. Two lessons of relevance to this chapter include ensuring sustained participation of the Indigenous community over the development and delivery and ensuring engaged faculty within the institute who are committed to advancing Indigenous pedagogy and research that includes attention to the understanding the impact of colonization on individuals and communities (Moeke-Pickering and Cote-Meek 2015).

Internal relationships with allies and senior leaders are also important to bringing about change. Over the years, Indigenous staff, faculty, and administrators have worked to bridge, albeit sometimes challenging, understandings between Indigenous and non-Indigenous peoples. A priority for LUNEC since 2006 has been the establishment of a new physical space, the Indigenous Sharing and Learning Centre. This

space was envisioned as a space that would serve both Indigenous and non-Indigenous peoples. First, the space is meant to serve as a resource for success for students, second the space will be a place to nurture and advance Indigenous knowledge and scholarship, and finally the space will become a point of contact for information on Indigenous peoples' history, knowledge, and culture (Laurentian University ISLC Pamphlet 2015). LUNEC wanted the space to be highly visible on campus to signify Indigenous people presence, but they also hoped the space would serve to bring people together to learn about Indigenous peoples. After 10 years of fundraising efforts, the new Indigenous Sharing and Learning Centre, a 7500 square foot space, opened in March 2017. Ensuring the establishment of this space required much advocacy and dialogue with key decision makers and the university community. Building positive relationships across the university, within the community, and within the provincial sector cannot be overstated. Without the support of many, this initiative would not have been realized.

In addition to local and regional relations, there are increasingly global pressures that have impacted approaches to education. In this regard, Indigenous peoples through various avenues have created strong international linkages that have had an enormous impact on moving their fight for a rightful place in universities forward. These provide important avenues to build strength, collaborate on common issues, and create better and more meaningful places for Indigenous peoples within mainstream educational institutions.

After being involved in advocacy work for over 25 years, first as an individual faculty member and in the last 11 years as a senior university administrator, it is good to see the movement across Canada with respect to responding to the educational aspirations of Indigenous students, peoples, and community. This momentum and the relations require ongoing nurturing in order to be sustained.

West: Building Respect

Central to building relationships is building trust and respect. This is no easy task when we consider that the universities are built on a tradition of hierarchy. Elsewhere I have described in detail how racism remains deeply embedded in universities and have explained how Indigenous students and professors negotiate these challenges as well as their Indigeneity in academy (Cote-Meek 2014). Part of building trust and respect has meant that Indigenous peoples themselves along with allies have had to reach across the university to dispel myths and stereotypes about Indigenous Peoples. Watson and Watson (2013) note that, "Ultimately, for leaders to realize transformative change successfully across the entire system, mindset change is necessary to implement key paradigm shifts" (p. 44). The work at changing mindset takes much time and effort. Some of the efforts in the senior administrative Indigenous programs office, Indigenous student affairs, the School of Indigenous Relations, and Indigenous Studies departments have included implementation of several Indigenous speaker series, workshops, language classes, and events that are made available to the entire university community. These events are important in building and nurturing understanding of Indigenous Peoples and building respect across peoples. These events also target changing the narrative about Indigenous peoples and work towards dispelling existing racialized beliefs about Indigenous peoples.

In addition, the university itself, in its last strategic plan, identified several strategic initiatives to increase understanding.

Several key positions and departments were established over the years to assist with building understanding, respect, and moving the needs of Indigenous communities forward within the institution. These include the leadership positions of the Chair of Indigenous Studies, Director of the School of Indigenous Relations, Manager of Indigenous Student Affairs (now Director of the Indigenous Sharing and Learning Centre), and the Associate Vice-President Academic and Indigenous Programs. Each of these positions was established at various points in time and has assisted with building a cadre of understanding among non-Indigenous faculty, staff, and students. These leadership positions have also been instrumental in building a sense of community within the institution itself, which was vital to Indigenous employees whether they are staff or faculty. Both Indigenous staff and faculty can feel isolated working in a department where they may be the only Indigenous person. Having opportunities to gather as an Indigenous community is viewed as important in building community internally. As a result Indigenous faculty now have regular meetings to gather and discuss issues related to their academic work.

Further to building respect, many Indigenous faculty and staff sit on a number of institutional committees to ensure an Indigenous voice is heard. This was not always easy when the number of Indigenous faculty and staff was much smaller than it is today. Building a critical mass of Indigenous peoples on campus is further discussed under “[North: Movement](#)” section of this chapter.

Building respect has also included raising awareness at the university about the traditional lands upon which the university is situated. As a result, Laurentian University as well as most universities across Canada now acknowledge Indigenous peoples as the traditional territorial caretakers of the land. This acknowledgment seems a rather a simple act. However, it was not too long ago that this acknowledgment did not occur, nor could people envision its importance. Today this has become an important and critical starting point in any major event in most universities across Canada as well as at Laurentian University. Starting presentations or public addresses with this announcement not only acknowledges that Indigenous peoples have existed on the lands prior to colonization but it also validates the continued existence of Indigenous peoples. In my view, acknowledgment counters the racialized belief of the “dying Indian” (LaRocque 2004). Discussing land acknowledgment and the introduction of signage Blight and King (2016) note that these “efforts contribute to reinserting Indigenous peoples into a landscape historically intent on their erasure” (n.p.). They go on to also point out that there are risks in these acts becoming superficial. For example, Blight and King (2016) state that using the word traditional often denotes a postpresence rather than an existing presence and they recommend dropping the word traditional and simply stating “just territory” (n.p.).

North: Movement

Movement in its broadest sense refers to taking action. In transformative change, these can be a series of identifiable strategic moves that will assist with bringing about system wide changes. Increasing the number of Indigenous peoples at the university has been an identifiable move that has been critical to change. Without a

critical mass of Indigenous students, staff, and faculty, it would be difficult to institute sustainable change. This section highlights two specific actions taken to bring about change: one was to increasing the numbers of Indigenous peoples at the university and the second centers around making changes to the curriculum.

Increasing Critical Mass of Indigenous Students, Staff, and Faculty

Since the early 1990s there has been a concerted effort on campus to provide academic, social, and cultural supports to Indigenous students through the Indigenous Student Affairs office (formerly Aboriginal student affairs). The early beginnings of the support services were largely centered on supportive counseling and cultural supports. Over the space of 25 years, the Indigenous Student Affairs has grown to include seven staff and four Elders who provide a wide range of supports that include academic writing and research, academic advising, academic preparation and transitioning, personal, academic and career counseling, scholarship and bursary information, mentorship program, recruitment and retention initiatives, community liaison and outreach to Indigenous communities, and a traditional resource program that includes visiting Elders on campus. The number of Indigenous students has grown from approximately 200–300 from the mid-1990s to nearly 1,100 in 2017, which represents approximately 11% of the general student body.

In 2006 the university created the new position of Director of Academic Native Affairs to lead the Indigenous academic portfolio. This position was responsible for leading the development of the Indigenous Sharing and Learning Centre and enhancing the academic sector's response to Indigenous student needs. The position evolved over time and changed to an Associate Vice-President Indigenous Programs in 2009 and then to the Associate Vice-President, Academic and Indigenous Programs in 2011. Each iteration of the position broadened the scope of the position, and now the position includes responsibility for university wide academic initiatives with respect to Indigenous programming and is the academic administrative lead for faculty relations. This position has been instrumental in maintaining strong links with LUNEC and the Indigenous community and providing senior leadership for the Indigenous portfolio at the university.

In the 2012–2013 academic year, Laurentian University began a process of increasing the number of Indigenous scholars across a range of disciplines. Several key factors led to the hiring of an additional 13 Indigenous faculty across a range of disciplines including anthropology, architecture, English, geography, history, labor studies, rural and northern health, and sociology. As noted earlier, the 2012–2017 University strategic plan as well as the University academic plan set a specific goal to increase the number of Indigenous faculty. In addition, the faculty collective agreement had language that dealt specifically with putting in place a grow your own program to increase the number of Indigenous scholars. Critical to increasing the number of Indigenous scholars was a climate that supported the need. For the School of Architecture, this was done through the early consultation with LUNEC during its development. LUNEC appointed its Associate Vice-President, Academic and

Indigenous programs to sit on the advisory committee that was leading the development of the school to ensure that there would be a strong Indigenous perspective. When the School opened, the new Director took the lead and ensured that Indigenous scholars were subsequently hired. In addition the Dean of the Faculty of Arts also took a lead in working with her faculty to increase Indigenous scholars. As a result there are now 25 Indigenous faculty, 2 of whom are senior administrators, in fulltime tenure track positions across a variety of disciplines. Indigenous faculty include those of our federated partner as well as the Northern Ontario School of Medicine east campus. Further one of these positions is a recent Canada Research Chair (CRC) in Indigenous Health, the first Indigenous faculty at Laurentian University to fill a CRC. The CRC program is a prestigious initiative established by the Government of Canada to increase research excellence.

Indigenizing the Curriculum

Indigenization of the curriculum has been a highlight of discussion in Canada in the last few years. Last year, the University of Winnipeg and Lakehead University announced mandatory Indigenous courses for all their students (MacDonald 2015). Laurentian University took a slightly different approach and emphasized the importance of hiring Indigenous faculty first. With the number of Indigenous faculty at Laurentian University now at 25, the senate of the university recently passed a motion that would implement a mandatory six credit course with at least 50% Indigenous content as a graduating requirement for students taking the Bachelor of Arts, 3 or 4 year programs. The whole issue of making a mandatory Indigenous course is not without controversy. For example, questions arise about what constitutes Indigenous content, who should be teaching these Indigenous content courses, and how/who will determine what course has 50%. However, the important point is that there is movement in Canada to indigenize curriculum, which has largely been in response to the TRC Calls to Action (2015). Indigenization of the academy is important so that graduates come with a critical lens to understand the history of Indigenous and non-Indigenous relations, the impact of colonization, and can understand, reflect, and think critically in making decisions in the future work or place in society.

Conclusion and Future Directions

Where to from here? While much has been accomplished in terms of transforming the postsecondary landscape at this one institution as well as many others, there is still much work to do ahead. The release of the TRC Calls to Action (2015) and the recent change in government in Canada has created a wave of hope for Indigenous peoples. Many of us who work in postsecondary education recognize that we have an opportunity to continue to propel changes in the system. Looking forward to a future with reconciliation will require a several actions that include but are not limited to the following:

- Sustained and meaningful efforts from both Indigenous and non-Indigenous peoples to work towards reconciliation.
- Recognition that addressing racism is everyone's responsibility. The burden of addressing racism and social inequalities must include all sectors of society and not just those who continue to be deeply affected.
- Validation from the general Canadian society, communities, and individuals that extreme harm has been done to Indigenous peoples. Without validation, it will be difficult to move to forgiveness and building relationships that are respectful, equitable, and meaningful.
- Change in behaviors must reflect a deep understanding of the role that Indigenous peoples play in this country.
- Developing partnerships that are meaningful, respectful, and mutually beneficial across sectors.
- People working the fields of education must recognize the important role they play in shaping the citizens of the future.

Postsecondary institutions play a critical role in shaping the next generation. With this role comes responsibility. As leaders in education we have an enormous opportunity to do the right thing, to right wrongs, and build better, more conciliatory relations among the next generation of citizens. Bringing about transformative change is challenging and complex and if we are to continue to effect change and sustain the ground we have gained we must, as Indigenous peoples, continue to demand changes to postsecondary education and policy as it affects Indigenous peoples.

In closing the circle, the Medicine Wheel teachings are a powerful transformative tool that many Indigenous communities have available to understand and live in the world. I leave these key messages from my personal and professional experiences in working in the area of Indigenous education:

- Stay rooted in your own Indigenous values, ways of being and knowing
- Utilize your cultural and traditional understanding of the world to help guide any transformative changes you embark on
- Remember that change is complex, takes time, requires nurturing
- Always keep at the core of your being, your ancestors, and the people

Abstract

In this chapter, Villegas describes a range of efforts by tribes and tribal advocates to improve the appropriate use of data in decision-making and community planning. She discusses approaches such as, mapping existing government data, data disaggregation, and strengths-based evaluation. Critical insights coming from this work include fostering Native-to-Native comparisons, developing community-based indicators, shining a light on system accountability, and establishing an ethics of data development.

Keywords

Tribal data · Indigenous evaluation · Disaggregation

While American Indians and Alaska Natives are an integral and unique part of US society, *we continue to be invisible* to most other Americans due to an absence of data, accurate media images, and historical and contemporary awareness about Native peoples in schools, healthcare facilities, professions, military service, and daily life. This invisibility is perpetuated by federal and state agencies and policies that leave American Indians and Alaska Natives out of data collection efforts, data reporting and analysis, and/or public media campaigns. American Indians and Alaska Natives may be described as the “Asterisk Nation” because an asterisk, instead of data point, is often used in data displays when reporting racial and ethnic data due to various data collection and reporting issues, such as small sample size, large margins of errors, or other issues related to the validity and statistical significance of data on American Indians and Alaska Natives. To combat this invisibility, tribal nations and other Native organizations are making efforts to develop their own data, establish innovative ways to using data to understand the realities facing their citizens, and create innovative, community-based methods of measurement. In what follows, I describe the roots of invisibility and the efforts to make visible and valuable the strengths of Indigenous youth and families in the United States.

Becoming Invisible

Erasure has always been a key tool of colonization – to do away with the history and lifeways of Indigenous people to justify a new narrative that frames the occupying group as the rightful “owners” of a place. Schooling has been a major lever in that erasure in many places, including what is now called the United States of America (Adams 1995). Designed to destroy the values system and specifically undermine the communal stewardship of land, schooling – through forced integration as Deloria (1988) denotes – has been essential in eliminating the intergenerational relationships of place and kin that formed the foundation of many of our American Indian and Alaska Native communities and cultures (Adams 2008). Here “schooling” refers to a genealogy of education policy characterized by separation (I want to acknowledge Maringi Brown-Sadlier for her work on Motherloss and separation that have informed my thinking about how pervasive policies of separation are in the genealogy of education policy.), division, and disdain for what were and are seen as “dangerous” Indigenous cultures that challenge the American origins of discovery and dominance (Lomawaima and McCarty 2006).

With the rise of the high-stakes testing movement, the use of data in education policy and system decision-making has served as another policy tool that erases the voices, realities, and strengths of American Indian and Alaska Native (AI/AN or Native here) children and families. Sparked by the 1983 *A Nation at Risk* Report in the US and spurred by two subsequent decades of policy emphasizing data-driven decision-making and the measurement of individual student performance, this movement reifies previous efforts to frame Indigenous communities first and later

Indigenous families as incapable of caring for the educational needs of Indigenous children. Now, it is our Indigenous children themselves who are framed as not being able to keep pace with their White and East Asian peers as measured by student proficiency on standardized tests.

Yet, access to quality data and information is an essential element of tribal sovereignty and a core component of the US federal government's ability to honor the trust responsibility to tribal nations. There is a critical need for accurate, meaningful, and timely data collection in Native communities. Tribal leaders need access to quality data in order to make the best decisions for their citizens and advance their policy and planning efforts. However, access to meaningful, quality data continues to be a challenge for American Indian and Alaska Native communities.

Federal agencies are charged with collecting data on American Indian and Alaska Native people, as well as from the general US population, in order to determine budget requests; support and strengthen budget justifications; allocate resources; provide services; conduct strategic planning; and comply with statutory and regulatory reporting processes. And where there are data being collected and reported, discussions of equity are often overtaken by a focus on disparity, which can render invisible essential community strengths and obscure potential solutions. Accurate data collection and community-based planning captures true needs, and thus can drive larger programmatic investments resulting in a cost-effective use of tribal, federal, and private resources. Without quality data, policymakers and community planners cannot set policy goals, monitor implementation, measure impact, or plan for demographic shifts in an effective way. Even when there is an emphasis on addressing diversity or equity through policy, data on American Indian and Alaska Native people are rarely available or included. Our communities are seen as too small to enumerate, too costly to include in national data collection efforts due to the cost of collecting data in rural communities, and too difficult to compel to participate in research efforts. Snipp describes some of the issues with the largest, most comprehensive decennial data collection process in the US:

The US Census Bureau is the single largest and most comprehensive source of information about American Indians and Alaska Natives, as well as Native Hawaiians. This information is collected in conjunction with the decennial census and a very large survey known as the American Community Survey. The Census Bureau embeds categories of indigeneity within its question about racial heritage—the same question used to identify other racial groups in American society. It takes virtually no heed whatsoever of the sovereign political status of American Indians beyond an instruction to ‘print principal or enrolled tribe’ for persons who indicate they are American Indians. Persons who do not report a tribe are tabulated simply as ‘Tribe not reported’, and about 20 per cent of persons reporting to be an American Indian did not report a tribe in 2010. (Liebler and Zacher 2013, p. 43)

The absence of American Indian and Alaska Native peoples in data and policy domains reflects the lack of a national public discourse on the status of our nation's First Peoples.

Flipping the Script

American Indian and Alaska Native youth are often invisible in federal data sets, due in part to the small size of the overall population of Native peoples in the US. However, the extent to which they are represented in data sets reflects our commitment to and ability to understand and address their unique needs. There tend to be four things policymakers at a federal level know about Native youth, if they know anything at all. They know that our young people suffer from high rates of obesity and diabetes, abuse harmful substances at a high rate, dropout out of school, and commit suicide. Native leaders and organizations have and continue to contribute to these narratives in order to draw attention to community needs and generate policy change and resources for our youth. However, Native youth have been advocating for different narratives to emerge that represent them as “more than that” (see the video South Dakota Native youth developed in response to Diane Sawyer’s documentary about the Pine Ridge Indian Reservation www.youtube.com/watch?v=FhribaNXr7A). Organizations like the National Congress of American Indians, the National Indian Education Association, the National Indian Child Welfare Association, the National Indian Health Board, and the Center for Native American Youth are working with Native youth and families to develop narratives based in Indigenous cultures and languages that reflect the strengths and realities facing our peoples. One of these efforts starts with improving access to existing data through calling for data disaggregation with federal and state policymakers.

Where we find fairly good data at a national level, there is an ever-present need to access data at state, county, and tribal levels to develop relevant policy and program supports. Tribal and community planners need better data to harness local resources to areas of greatest need and to hold state and federal governments accountable to meet the needs of our nation’s first peoples.

In addition, the research and data on the importance of Native cultures and languages is taking place at a local, and often isolated, level such that national Indian policy research rarely accounts for or highlights the value of Native cultures and languages. A coordinated and comprehensive approach is needed for measuring and reporting how Native cultures and languages matter, especially in light of the rapidly changing demographics in the US and in Indian Country.

Because policymakers use national datasets (both government and private) to shape billions of dollars in funding allocations and develop policy interventions to serve American Indian and Alaska Native communities, it is vital for federal agencies and private entities to collect adequate data in Native communities. Unfortunately, the data describing Native communities is often insufficient, unreliable or completely absent. The lack of data affects policymaking at federal, tribal, and state levels.

Some of the goals driving current efforts include:

1. Exploring the current universe of existing data on American Indian and Alaska Native people and places to assess data quality and identify strategies to improve existing data for community and policy use

2. Building tribal capacity to collect and use their own data
3. Improving data use

As part of addressing these needs, the following questions are prioritized:

- What data related to American Indians and Alaska Natives are being collected by federal agencies?
- What is the quality of these data and measures (e.g., sample size, age of report)?
- What is the method of data collection (e.g., individual self-report on a survey, organizational records) and has tribal approval been granted?
- What is the “definition of Indian” used?
- Are the comparisons used appropriate (e.g., Native to non-Native; Native to Native; regional; international comparisons)?
- What measures are important to American Indians and Alaska Native leaders?

Exploring Existing Data on AI/AN People and Places

The United States boasts unmatched scientific capacity. This capacity extends to the social sciences, to the rich and detailed demographic data compiled and disseminated by the Census Bureau, and to other federal agencies. Nonetheless, the United States has long failed to provide even the most basic enumeration of American Indian and Alaska Native people (Sandefur et al. 1996; Snipp 1996). Despite thorough documentation that our population is at great risk of poverty and the problems that flow from poverty (US Commission on Civil Rights 2003), detailed information about labor force participation, social service needs, educational attainment, and related information is sparse and unreliable (DeWeaver 2013; Westat 2007). Perhaps more surprising (and disturbing) is that this failure persists into the twenty-first century. The federal government has no plan and has made no commitment to address this deficit. This failure to provide basic information about AI/AN peoples creates challenges to tribal governments, city and county governments, state governments, federal agencies, Native-serving organizations, and individuals.

Advances in computing capacity and telecommunications allow for unprecedented increases in our capacity to collect and manage large quantities of data, and to analyze enormous data sets. The twenty-first century cyber-infrastructure of the United States will, no doubt, build on this foundation to further expand large-scale data collection and analyses. But the technological capacity and this cyber-infrastructure must also be attuned to addressing acute failures, including failures stemming from low trust, cultural insensitivities, and sparse (as opposed to abundant) data. This failure begins with federal agencies (including but not limited to the Bureau of the Census, Bureau of Indian Affairs, and Bureau of Labor Statistics). As the United States fails to provide reliable enumeration of AI/AN people, it goes without saying that detailed information on employment, poverty, and related sociodemographic information is also lacking. With notable exceptions, tribal governments lack the capacity (financial resources and human capital) to fill the void.

Moreover, this failure extends to the social sciences. Social scientific research typically relies on federal data for preferred measures of demographic, employment, and inequality trends. Given the absence of federal data and their relatively small population size, the social science literature typically ignores American Indians and Alaska Natives or, perhaps worse still, simply lumps this population in the “non-white” category people (Sandefur et al. 1996; Snipp 1996). These crude measurement strategies leave social scientific theories and findings ill-equipped to understand past and current dynamics at work in Native populations. Due to this inattention, the social sciences are not filling the void left by the federal government’s failures, nor are the social sciences providing assistance to tribal governments and Native communities.

Priority data include tribal-level information about tribal population, tribal membership, and household demographics. Federal funding formulas rely on various data sources to determine the population of tribal members eligible for federally-supported services. The service population typically includes a tribe’s estimates of all American Indians and Alaska Natives, members and nonmembers, who are living on or near the tribe’s reservation or trust land (hereafter “tribal lands”) during a calendar year and who are eligible to use BIA-funded services. As such, a tribe’s service population typically excludes members who, for example, were serving in the Armed Forces, attending postsecondary institutions and not residing on tribal lands, or living elsewhere for purposes of direct employment, or due to being incarcerated or confined to a long-term treatment facility. Because service population includes American Indians and Alaska Natives who are tribal members and nonmembers, it obviously is not the same measure as tribal enrollment. In order to report estimates for use in the Indian Housing Block Grant Formula, for example, tribes may rely on their own data collection systems, information provided by the Bureau of Indian Affairs (BIA) Agency and the BIA Region they are within, Indian Health Service birth and death population data, and US Census data provided about individual and household counts of American Indians and Alaska Natives. Experience demonstrates that the US Census numbers can differ significantly from internal tribal enumeration of various populations and demographics. This must be taken into account at the federal, state, and local levels.

Building Tribal Data Capacity

Recognizing the profound deficits in extant data collection and despite the paucity of federal support, a number of tribal governments have compiled data on tribal members and other American Indian and Alaska Native peoples served by the tribe. Such efforts often lead to growing the governance capacity of tribal nations as it becomes important to integrate various tribal datasets and systematize tribal data policies to improve the collection and use of tribal data. These innovative and forward-looking efforts taken by tribal governments can serve as a foundation for more expansive data-intensive collaborative research. These data collection efforts are notable in several respects. First, tribes have a unique political status as sovereign

governments through a history characterized by treaties and the subsequent trust responsibility to the 566 federally recognized tribes. As such, tribal governments operate in the federal system in a manner that overlaps with state, county, and city governments, but that is nonetheless distinct. The specific nature of the intergovernmental relations between tribes and the federal government creates opportunities for tribes to act independently. But this distinctiveness is also one reason that the federal government has failed the Native population in its data collection efforts because this uniqueness is used to justify the difficulty of measuring and reporting on such a “small” population. Second, because data collection efforts have been undertaken by individual tribes, the goals pursued and the investment of human capital and funding varies widely. Third, the demands of designing and implementing data collection has contributed to capacity building by tribal governments and fostered partnerships between tribes and social scientists (in and out of academia). This enhanced tribal capacity and proliferation of partnerships with social scientists creates an opportunity to undertake participatory research of unprecedented scope and scale (Fuller-Rowell 2009).

The preceding paragraph identifies promising opportunities. But the challenges remain daunting. Relatively few tribes have invested the time and energy to compile and analyze sociodemographic data. Even among the minority of tribes undertaking these efforts, there is great variability in the data quality, sampling strategies, and methodology. As such, it is difficult (often impossible) to combine data from one tribe with data compiled by other tribes (in the same region, let alone across the country). Compounding this challenge, federal data sources are not readily available to serve as a benchmark for tribal efforts. The deficits in federal data and high variability of tribal efforts leave individual tribes without the means to reliably assess the quality of their efforts. For social scientific research and for the tribal goals of service delivery and planning, it is essential to collect comparable data on a regular basis. Stated in pessimistic terms, there is a risk that the innovative tribal data collection efforts currently underway may be underutilized (perhaps squandered) unless the means to sustain and routinize data collection are established. Moreover, for both tribal purposes and social scientific research, it will be important to create and maintain the means to store and share these data. Buoyed by the progress made by individual tribes but cognizant of the daunting challenges that remain, national Native organizations are committed to developing the infrastructure (physical, human capital, and community-building) to institutionalize these efforts in individual tribes, develop methods and resources to facilitate learning and data-sharing across tribes, and build robust partnerships with social scientists in and out of academia.

There is an inherent paradox here that is embodied by a notion relayed by a group of men from the Maasai Tribe of Kenya when a colleague shared elements of the Indian Country Counts 2010 Census Campaign with them. They thanked him for sharing the efforts of tribal nations in the US and national Native organizations to encourage Native people to complete their decennial Census forms, and said, “We will never be counted.” They proceeded to share their perspective that participation of any sort in a government-sponsored Census or data collection effort gave away

their community identity and self-determination. This echoes the perspectives of some tribal leaders and communities who have decided not to participate in research or Census efforts. Most notably in the US are many of the Haudenosaunee Peoples from the Six Nations Confederacy, who often do not participate in the Canadian Census either. Tribal leaders working to leverage federal resources for their people while standing firm in advancing self-determination are often seeking a way through this paradox in the best interest of their peoples, places, and lifeways.

Improving Meaningful Data Use through Disaggregation

To advance a new narrative about Native youth and their families by improving the use of data, some national Native organizations are promoting the disaggregation of American Indian/Alaska Native data. Data are disaggregated when information is reported for subgroups from a larger aggregate group (e.g., disaggregating a national rate to rates for the 50 states; disaggregating within a state to rates for the counties within that state; disaggregating a national total for racial/ethnic subpopulation estimates). For example, disaggregating national American Indian/Alaska Native data on health outcomes to state-level reports for the 10 states with the largest AI/AN population would provide key insights on strengths and disparities obscured in national reports. Typically, data are disaggregated for a population with distinct status (e.g., racial/ethnic status, disability status), for a language group, or by geography. With regard to American Indian and Alaska Native people and communities, it may be important to disaggregate data in the following ways:

- **By tribal nation, subtribe, or other cultural grouping** to explore cultural and political uniqueness and equip tribal leaders in their planning efforts
- **By geography**, to explore intra and intergroup differences with regard to statistical areas such as on- and off-reservation, county, state, or region
- **By demographic characteristic**, to explore differences by age and gender, for instance
- **By status**, to explore the impact of group membership such as enrolled or nonenrolled tribal member or Native language speaker or nonspeaker

In some instances, disaggregation can increase access to existing data without much cost as it does not always require new data collection, only new approaches to reporting and sharing existing data in different ways to equip users to conduct more meaningful analyses. In other instances, however, there may be additional costs as new data may need to be collected – such as additional questions on surveys, data sharing agreements, and/or tribal permissions to access and use tribal-level data to enable further levels and types of disaggregation.

In addition to these issues, it must be noted that efforts to disaggregate AI/AN data eventually confront the issue of preserving the confidentiality of the individuals included in the aggregate, and this issue has become more difficult in some ways as the ability to merge traditional datasets with new administrative or private datasets

has grown. There is also the issue of preserving the confidentiality of tribal nations and securing tribal permission to report tribal data in efforts to disaggregate data to the tribal level if data has been collected with tribal identifiers.

Inevitably, disaggregation efforts must take into account the genealogy of how the “definition of American Indian or Alaska Native” has emerged and how these constrain what we understand about Native people were we to use culturally-driven definitions or identities. As Snipp (2016) notes:

On one hand, indigeneity is a group characteristic that defines the qualities of a collectivity. On the other hand, it is also a personal characteristic that either binds together or sets apart individuals from the larger collective of people deemed to be ‘indigenous.’ (p. 41)

Yet, data disaggregation also enables Native-to-Native comparisons – as opposed to gap-based comparisons – and may get us closer to allowing analyses that explore a people group’s relationship to place and to others in the region. Native-to-Native comparisons can gauge strength and indicate areas for collaboration by highlighting where Native people are experiencing greater success and improved outcomes that could be examined for insights that could be shared. They can also indicate particular areas of system weakness by showcasing where one state may be falling behind others that have demonstrated success in meeting the needs of Native youth and their families.

A New Approach

There are three elements that drive this new approach to using disaggregated data to tell meaningful stories about the strengths and realities facing Native youth and families: (1) Re-framing measures by selecting indicators in a meaningful way; (2) Using data to highlight system accountability; and (3) Fostering Native-to-Native comparisons to highlight strengths. As suggested above, the narratives about Native youth and families have been designed to displace and denigrate, so if data are going to be used to uplift, there first needs to be a reorientation to the indicators used – a willingness to bring together indicators across agencies and to use those that might not typically be used.

For example, most policy reports that include American Indian/Alaska Native data begin with a focus on poverty. While I was at the National Congress of American Indians, we began to use a lens of “family economic capability” to highlight both the strengths and needs of Native families and the youth they support. Within this lens, we place data on household income alongside information on family composition, languages spoken at home, child poverty, home ownership and values, housing infrastructure and overcrowding, and participation in public assistance programs. By doing so, we are able to highlight a range of dynamics that contribute to family economies that also reflect a range of cultural aspects that contribute to the unique strengths and needs of American Indian and Alaska Native families. For instance, grandparents are more commonly involved in raising their

grandchildren in many Native homes. They can contribute important cultural and community support for children. However, they may also require additional supports if they are disabled, have health issues, or live on a fixed income in order to provide adequately for the grandchildren in their care. Additionally, Native children may live in homes where a language other than English is spoken more frequently than non-Native children in some states. Exposure to more than one language can provide improved educational or employment outcomes if the proper system supports are in place to support bilingualism. If the supports are not in place in education or economic systems however, the potential of Native languages to contribute to family economies may be unrealized. In this way, instead of seeing large, extensive families as an economic drain, we began talking about the value of having grandparents contributing to rearing their grandchildren and the need for policies to support them in doing so.

In other instances, we started referring to data from child welfare and juvenile justice systems as that relate to the “system involvement” of Native youth. This leads to the second element, which is using data to highlight system accountability, instead of only focusing on the “deficiencies” in Native youth and their families, which is what past policy has done. By employing different indicators and placing data from multiple agencies alongside each other – data on AI/AN education, health, and system involvement to identify system strengths and gaps – we can begin to see how systems are supporting or not supporting Native youth and their families.

The third element of fostering Native-to-Native comparisons works further to highlight system strengths and challenges by exploring how states with high populations of Native youth are serving them and their families. Examining AI/AN data at a state or local level, across agencies, allows us to look within and across states to improve services provided, as well as to identify areas where disaggregated data may not be available. The National Congress of American Indians has developed regional profiles that showcase how to explore state-level data and use Native-to-Native comparisons to highlight how to prioritize state-level and regional discussions. One use of these sorts of comparisons would be to convene state teams responsible to serve Native youth and families to share information and develop strategies. National Native organizations have begun to communicate disaggregation needs and priorities to federal agencies in order to improve data reporting. A few good examples of the type of data disaggregation that could serve as a model includes:

- National Center of Education Statistics Digest of Education Statistics, Public high school averaged freshman graduation rate, by sex, race/ethnicity, and state or jurisdiction, 2012–2013 (Table 219.40)
- National Center of Education Statistics Digest of Education Statistics, Total fall enrollment in degree-granting postsecondary institutions, by level of enrollment, sex, attendance status, and race/ethnicity of student (Table 306.10)
- National Center of Education Statistics Digest of Education Statistics, Degrees conferred by postsecondary institutions, by race/ethnicity and sex of student, 2012–2013 (Table 321.20, 322.20, 323.20, 324.20)

- Office for Juvenile Justice and Delinquency Prevention, *Census of Juveniles in Residential Placement, Rates of Juveniles in Residential Placement*

These are rare examples of disaggregation by state, AI/AN status, and gender, which can equip communities with information they need to inform their decision-making and hold federal and state systems accountable for serving Native youth and families.

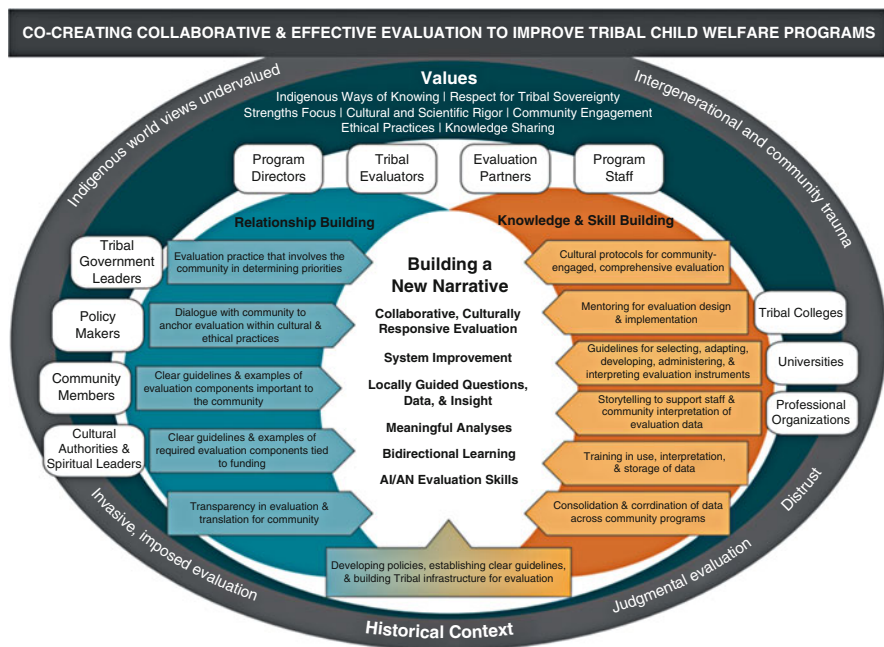

Native-to-Native comparisons are not the ultimate solution to transforming the use of data into a meaningful exercise as they rely on state and federal measures. However, it is a real way for tribal nations to push back on the notion that there just are not enough tribal-level data to support innovative education policy; that tribal populations are just too small to be measured; or that policy solutions must emphasize reforming the behaviors of Native youth and their families. It is a pathway into shining a light on system accountability and on the appropriateness of existing measures to report on the realities facing Native peoples.

Community-Based Methods of Measurement

In addition to collecting tribal-level data and improving the availability and use of existing data, tribal nations are involved in shaping community-based measures. Many of these efforts start by asking different questions or any questions at all about what realities our Native youth and families are facing. For instance, when I was at the Alaska Native Policy Center of First Alaskans Institute, we developed research about what contributes to Alaska Native student success. Instead of starting by asking how many of our Native youth are dropping out of school, we began to explore where they were going. We learned that many were pursuing their GEDs, or General Education Diploma at some of the highest levels in the nation; pursuing work in entry-level positions in high-risk industries; and enlisting in the military. At the same time, we began observing the high rates of Native youth facing school discipline, with special education designations, and the pathway for these students into juvenile justice facilities. As such, we started to develop measures of student “pushout” and “lure out” to document more of the realities our Native students were facing.

In a similar way, Australian Indigenous scholar, Lester-Irabinna Rigney, gave a presentation where he critiqued surveys of teachers of Indigenous students. He noted that these surveys often ask teachers to describe what they believe and know about Indigenous students and their cultures. Due to expectations about political correctness and a lack of relationship between what teachers know and what they do in the classroom, these surveys rarely help us understand how to strengthen the relationship between teachers and their Indigenous students. Instead, Rigney suggests we ask how teachers come to know – through their lunchroom conversations with other teachers, from their university courses, from research articles, or from their interactions and relationships with Indigenous youth and families. This sort of questions leads us to developing measures of teachers’ knowledge networks and fostering ways to map cross-cultural relationships.

In one other example, groups of Indigenous evaluators and other non-Indigenous advocates came together to create a framework for evaluation in tribal child youth contexts (Children’s Bureau 2013), recognizing that so much of the narrative and data collection being done in Native communities is done at the level of program evaluation of federal initiatives. This group committed to outlining the ways evaluation can be used to acknowledge tribal histories and genealogies of intervention, affirm cultural concepts and dynamics, and tell meaningful stories that build tribal capacity to use data. The framework hinges on two levers of relationship building and knowledge and skill building in order to build a new narrative through evaluation. A new approach to evaluation is changing the ways communities communicate their tribal child welfare priorities and values. Measurement and evaluation becomes a pathway to transforming awareness and supports for Native youth and families.

Conclusion

So much of federal policy is built on disparity data and gaps, when it does not ignore completely the needs of American Indian and Alaska Native youth. By employing a few of these new approaches, we enable a strengths-based approach to data and policy development. Some tribes may not have the resources or

capacity to collect their own data, but may be able to inform the evaluation of their federally-funded programs or examine existing data in ways that illuminate more about their citizens and the systems that are supposed to serve them. Yet, it is going to take all of use – from federal policy makers, to system leaders, to advocates, to tribal leaders and their citizens – to transform how we use data to strengthen the education, health, economic, and justice experiences of Native youth and their families.

Work to improve data inevitably leads to an examination of ethics involved in data collection. Some of the related implications of making investments in using AI/AN data to better effect means that we must be willing to examine paradigms undergirding research ethics and data collection procedures. There is a “participation” culture that is rampant that sees the increase of AI/AN participants as the gold standard of success in collecting data. This chapter, however, suggests that community engagement on indicators, data use, and measurement are also critical in improving the research enterprise and in leading to improved outcomes for Native youth and families. The promise is to move our nations from being asterisks to sites of significance in improving outcomes for all communities. In this way, Native youth and families become shining lights guiding us to a more equitable reality.

Abstract

This chapter focuses on the development of an indigenous Sámi language higher education institution; from its early establishment as the Sámi University College to its current status as the Sámi University of Applied Sciences. In its advancement, priority has been given consciously to indigenous language, both as a subject and as a means of instruction. Indigenous knowledge and scientifically “approved” (mainstream) knowledge have been treated as equally valid in program curriculum and content development. Collective aspirations, motivation, inspiration, limitations, obstacles, challenges, solutions, and success have been analyzed in this chapter using key elements of transformative theory (Smith, Indigenous struggle for the transformation of education and schooling. Address to the Alaskan Federation of Natives (AFN) Convention, Anchorage, Oct 2003. <http://ankn.uaf.edu/curriculum/Articles/GrahamSmith/index.html>. Accessed 15 Jun 2016, 2003). The main analytical tools are the concepts of language knowledge, knowledge transfer, knowledge creation, and knowledge reclamation – originally derived from the Maori conceptual framework of Mātauranga Maori (Black, Enhancing Mātauranga Māori and global indigenous knowledge. In: Black T (ed) Mātauranga Māori and indigenous knowledge. NZQA: New Zealand Qualification Authority, Wellington, pp 5–10. <http://www.nzqa.govt.nz/assets/Maori/Te-Rautaki-Maori/Publications/Enhancing-Mtauranga-Mori-and-Global-Indigenous-Knowledge.pdf>, 2014). These tools have been applicable to indigenous Sámi knowledge transition and the institutional development of Sámi language higher education. This chapter also shows, how the Sámi metaphor of Guovssanásti (The Morning Star) has acted as a designation of the institution, connecting the development process to the Sámi value system. In addition, the metaphor of building of a traditional Sámi tent (lávvu) has shaped an epistemological platform of the institution. The advancement of indigenous Sámi language higher education and research has occurred in a context of a great internal and external diversity. There are a variety of Sámi languages, cultural characteristics, and traditional means of livelihood, which have been influenced by many strong majority languages, cultures, religions, and political and educational systems across the borders of four national states. Future development perspectives have been suggested using four analytical concepts related to teaching in indigenous higher education: controversy, analysis, intellectual freedom, and engagement with complexity, diversity, and uncertainty (Andreotti et al., Epistemological pluralism: ethical and pedagogical challenges in higher education. *AlterNative* 7(1):40–50, 2011). The case of Sámi University of Applied Sciences is a novel solution for indigenous education and continues to attract the attention of indigenous and mainstream institutions worldwide.

Introduction

The official opening of Sáámi allaskuvla (Sámi allaskuvla, an original Sámi language name of the institution, is used throughout the article. All Sámi terms here are in North Sámi.) took place on November 1, 1989. Sámi allaskuvla is an indigenous Sámi language institution of higher education and research. The very first educational programs were in teacher education and traditional handicrafts. Later, Sámi allaskuvla provided opportunities to develop educational alternatives to suit the needs of the Sámi communities. Many previous organizational models for Sámi education failed to implement a Sámi-based approach to education. In Sámi allaskuvla, the North Sámi language has been privileged as a subject, means of instruction, tuition and, to a great extent, in research as well. The indigenous language has been the working language and means of administration. Sámi traditional knowledge and scientifically approved (mainstream) knowledge has been treated as equally valid in the elaboration of curriculum and content of all study programs and research projects. In this matter, Sámi allaskuvla is one of a few indigenous tertiary institutions which offers distinctive educational programs in the indigenous language.

The Morning Star

Sámi allaskuvla has its own traditional Sámi song called *luohti* in North Sámi, known in English as yoik. The *luohti* of Sámi allaskuvla represents the institution as the Morning Star of the Sámi. Situated in the heart of the Northern Sámi area in Guovdageaidnu (Kautokeino) on the Norwegian side of Sápmi (Map 1), Sámi allaskuvla has a strong North Sámi identity, while its portfolio is pan-Sámi.

The Morning Star (the planet Venus), *Guovssonásti* in Sámi, is the brightest star in the sky in the Northern hemisphere. This star is visible all over Sápmi just above the horizon during the long dark period of the polar night in autumn and winter. It is the first star to become visible when the days get shorter and the nights get darker after the end of the midnight sun during summer time. At the break of day, *Guovssonásti* is seen and perceived as a guiding star for anybody looking for a direction home. Sámi beliefs, storytelling, indigenous religion and conception of time, navigation skills, value system, and aesthetics have connections to *Guovssonásti*.

There are probably other indigenous educational institutions in the world which have an organisational anthem, but having its own traditional Sámi yoik is more than just an institutional anthem for Sámi allaskuvla. In accordance with the Sámi tradition, value system, and social structure, it is an expression of uniqueness, societal acceptance, and respect. According to Sámi tradition, knowledgeable tradition bearers can give a yoik to a person, a phenomenon, or a thing. The yoik is an expression of something special that has a unique character. The yoik is part of one's

Map 1 Sámi homeland and Sámi allaskuvla. Designed by Davvi Girji AS

identity, an additional name, and it passes into one's possession. The copyright of the yoik immediately transfers to the one that it represents. It is usually created in a way that is recognizable both by the melody and by the text as a representation of someone or something. Yoik tradition belongs to collective memory and is a special kind of traditional communication that includes verbal and nonverbal expressions. It has its own aesthetics and metaphorical language. (About luohiti, see for example, Gaski 2008.)

The yoik of Sámi allaskuvla was created by a group of the first students of the institution and was launched at the opening of the institution in November 1989. The opening of the very first academic year was accompanied with a seminar, the main theme of which was Sámi values (Utsi 2008, p. 127). The story goes that the first

teacher students collectively created a yoik to Sámi allaskuvla, as for them luohiti was genuinely and outspokenly connected to the Sámi value system. Since its first performance in 1989, new students and university staff have added new texts in the course of time to this luohiti. However, the metaphor of the Morning Star has prevailed been part of the institution's identity since its early establishment. This metaphor represents the role of the institution as a guiding star for the Sámi people throughout time and space, across the great diversity. Sápmi was historically divided by the borders of the following national states: Norway (historically the kingdom and crown of Denmark), Sweden and Finland (historically the kingdom and crown of Sweden), and Russia (in the past, the Russian empire, later the Soviet Union and now the Russian Federation).

From the point of view of indigenous language, there are ten Sámi languages many of which are not fully mutually understandable and are endangered minority languages spoken by approximately one-third of the Sámi population. Considering this linguistic diversity, one can easily understand that the advancement of Sámi allaskuvla has entailed considerable risks and challenges. The focus on Sámi language education has been a controversial issue because of many limitations, obstacles, and challenges. However, Sámi allaskuvla has in the course of almost 30 years successfully grown and advanced from being a small university college with the focus on teacher education to become a Sámi University of Applied Sciences with bachelor, master, and doctoral programs. The challenges nowadays appear to be slightly different from those during the establishment and formation stages of the institution. At present, Sámi allaskuvla has to fit the rapid socioeconomic, cultural, and technological changes in present-day society. The institution needs, in a more profound way, to respond to challenges of internal diversity and to the varied sociolegal contexts of the four national states where the Sámi reside. Furthermore, being owned by the Norwegian Ministry of Education and Research, the institution needs to deal with regulatory framework and general educational policy and its reforms, as well as with the increasing competition between institutions of higher education nationally in Norway. Collaboration in the Nordic countries and internationally has both challenges and potential, which will demand special attention from Sámi allaskuvla in the years to come.

Struggle

“We Had to Do It Ourselves”

These were the words of one Sámi teacher telling about the challenges of preservation and development of the Sámi language in the Porsanger fjord area in Northern Norway in the early 1990s (Sámi allaskuvla 1998, p. 22). In the 1980–1990s, the Sámi themselves took responsibility for the future of their indigenous language. Graham Smith, in his influential works about transformation in indigenous education (1999, 2003, 2015), has argued that to transforming education and schooling is one of the critical sites of struggle for indigenous communities. Like for Maori and many

other indigenous peoples, transformation requires a shift from being reactive to being proactive around their own aspirations, and taking autonomous control. In connection with the Maori language revitalization practices, the 1980s Smith calls for “a revolution in thinking” meaning taking responsibility “to make change for themselves and not wait for other people’s permission” (Smith 2011, p. 16).

The transformative action in education among the Norwegian Sámi in the mid-1980s was focused on school education. At that time, there were only Norwegian primary schools in the traditional Sámi areas. These schools had a so-called “Sámi supplement” that consisted of some thematic additions to the national teaching programs, concerning the use of the Sámi language and basic facts about the Sámi population (Keskitalo 2008, p. 71). It was obvious that schooling of this type did not cover the needs of the Sámi society; neither did it give any positive input into development of the Sámi communities.

The establishment of Sámi allaskuvla was directly connected to a clearly articulated awareness of the needs of Sámi society of that time, and a long-term struggle to maintain, strengthen, and develop Sámi identity, language, culture, and society. Articulation of the needs and aspirations of the Sámi demanded consolidation of the Sámi and non-Sámi educators and politicians in a long-term perspective. The Sámi educators were untiringly at the forefront of debate over the need to create a competent system and tertiary institution, that would prioritize Sámi understandings of identity, language, philosophy, history of colonization, and the loss of the language.

The Sámi themselves were confident about doing things for themselves, framing arguments to the Norwegian educational and political authorities, arguing for the need for funding of a specific Sámi language teacher education. These actions followed what Graham Smith (2015, p. 69) called “a need to make and lead change ourselves.”

Two evaluations of Sámi teacher education were conducted in 1972 and 1983 respectively, the first by the Norwegian Council for teacher education (*Lærerutdanningsrådet*), and the second one by the Regional University Council Board for Finnmark (*Det regionale høgskolestyret for Finnmark*). Both evaluations were led by Dr. Anton Hoëm from the University of Oslo and were called afterwards “Hoëm’s commission” (*Hoëm utvalget*). The evaluations suggested solutions for education of the Sámi speaking teachers and concluded that there was an unquestionable need for Sámi language teacher education in Norway.

The first evaluation was the grounding document for the establishment of a Norwegian teacher education college in Alta, in 1973 (Henriksen and Eira 2008, p. 11). Sámi teacher education at this college was, however, a supplement to the national, Norwegian language-based teacher education programs. It did not take long for the Sámi students and staff to see that the curriculum and content of the program were not able to change the status quo of the Sámi society. The program could hardly support the Sámi students’ success as Sámi teachers and language experts.

Generally speaking, the establishment of the Alta teacher training college with a Sámi educational *component* was quite a big step for the Norwegian state. For the

first time in history, teacher education in the northernmost part of Norway (Finnmark) was established. In the past, teachers who were supposed to work in the Northern areas and with indigenous Sámi children were educated far away from the North, in the educational institutions in bigger towns in the South or in the capital of Norway. This educational policy has its roots in the mission schools back in the 1700s, such as for example Seminarium Lapponicum (Grankvist 2003).

The deliberate emphasis on indigenous Sámi language was made by the end of the 1980s. This was time of the rising indigenous cultural and political resistance movement both nationally in Norway and internationally among other indigenous peoples. Struggle for the indigenous rights, for the Sámi language and cultural sovereignty, resulted in the establishment of many Sámi driven and controlled institutions.

The Nordic Sami Institute, which was merged with Sámi allaskuvla in 2005, was established in 1973 under the auspices of the Nordic Council of Ministers with the aim to enhance Sámi research in language, legal history, and social sciences. The institute was situated in the Sámi village of Guovdageaidnu, despite scepticism about the very possibility for the Sámi to manage a research institution by their own. Institute conducted among others a thorough evaluation of Sámi teacher education in Finland, Norway, and Sweden, already suggesting in 1978 the establishment of a Nordic Sámi university college (Keskitalo 2008, p. 73).

Many reports, especially the Official Norwegian Reports of the 1980s (NOU 1985a:14, 1985b:24, 1987:34), argued for the same. In the 1970s and early 1980s, a series of massive Sámi political protests, known as the Alta controversy, broke out because of the construction of a hydroelectric power station and the planned inundation of the village of Máze in Norway. The rights of the Sámi as indigenous people were put on the national political agenda. The Sámi Act of Norway (*Sameloven*) passed in 1987, and the Sámi Parliament of Norway was established in 1989. A corresponding Sámi political authority in Finland was established already in 1973, in Sweden in 1993, and in Russia, the struggle for the establishment of a political representative organization is still going on. Sámi language was in a threatened condition, a less used language in the public arenas by media, official authorities, and in education. Many Sámi groups, especially the coastal Sámi, were about to lose the language of their ancestors and meet or in many places accept language change into majority languages, and as a result to change their identity. The need for language revitalization gradually became an outspoken issue. Revitalization of the Sámi languages and culture required well-qualified people, able to consolidate, stop, and change the language shift. During the same period, orthographies for many Sámi languages were created and taken into use (Sammallahti 1998).

The public indigenous policy of the Norwegian state of that time was to support further development of the Sámi culture, languages, and traditional livelihoods in accordance with priorities made by the Sámi themselves, as a counterweight to many 100 years of the policy of assimilation and the Norwegization of the Sámi (Sámi allaskuvla 1994). The sustainable use of natural resources in Sámi reindeer herding, fisheries, and agriculture was under hard pressure. These traditional Sámi means of livelihood needed to be adjusted to the rapidly changing economic conditions. The state policy toward reindeer herding has since the 1960s brought changes and forced

many reindeer herders to abandon their traditional occupation. The state authorities highlighted a need for a formalized knowledge about sustainable development, biodiversity, and resource management as a traditional means of livelihood.

There was a need to find ways to formalize the local and traditional knowledge and give it legitimacy and to comprehend and analyze the rapid changes and the consequences of the state policies on the Sámi society. For this purpose, education needed to be based on a Sámi understanding of reality and conceptualization of the world. The Sámi traditional conception of *birgejupmi*, which is a North Sami term for life sustenance, livelihood, and maintaining a livelihood (Porsanger 2011, p. 20), became central. It was urgent to teach about life sustenance in new arenas. A traditional Sámi understanding of maintaining a livelihood requires skills, resourcefulness, reflexivity, professional, and social competence. It ties together people, communities, landscape and natural environment, the ecosystem, healthy social and spiritual development, and identity (Ibid.). It was essential to produce research-based knowledge that was grounded in the Sámi epistemologies and value system.

Public services were lacking Sámi-speaking personnel with formal education. Employers in nontraditional occupations desired formal education in nursery, public administration, management, etc. In addition, it was obvious that the majority society, especially those moving to the North, needed knowledge about the Sámi, their culture, languages, and way of life. By the end of 1980s, the Nordic Sami Institute accumulated considerable Sámi research experience. The educated university personnel was emerging. Moreover, there was a pool of potential Sámi-speaking students who desired education in their mother tongue.

The academic staff of the Sámi department at the Alta teacher training college were persistently asserting that education of Sámi language speaking teachers were crucial to the positive advancement of the Sámi society. In 1989, the Norwegian Storting (Parliament) decided to establish Sámi allaskuvla and allocated national funding for this purpose. This happened at the time when the main politics of the higher education in Norway was merging (Keskitalo 2005, p. 27).

Everybody who was in the forefront of the establishment of Sámi allaskuvla deserves deep gratitude and appreciation. Many Sámi scholars and educators and their academic allies from various universities, politicians, teachers, language workers, community representatives, organizations, and committees contributed to the establishment of Sámi University College, which took place in November 1989 (Fig. 1).

Formal and Indigenous Framework

Being part of the Norwegian system of higher education, Sámi allaskuvla has been a state university college owned by the Ministry of Education and Research and operated under the Norwegian Act relating to universities and university colleges (*Universitets- og høyskoleloven*), which promotes academic autonomy. The Ministry is a funding, governing, and executing body, which provides annual funding and result-based funding according to the number of examined students, completed degrees, and research outcomes in terms of external funding and publications.

Fig. 1 The first group of teacher students in 1992. Photo in possession of Lisa Baal, Sámi allaskuvla. (From the left in the upper row to the right and down: (1) Jan Henry Keskitalo, Einar Bergland, Paul Sundar, Jon Todal, Helge Almås, Liv Østmo, Johan Daniel Hætta; (2) Lisbeth Somy, Vuokko Hirvonen, Laila Susanne Sara Oscarsson, Kaisa Rautio Helander, Aimo Aikio, Mai Britt Utsi, Per Jernsletten; (3) Pirjo Länsman, Inker Anne Magga, Terje Østby, Lisa Baal, Josefine Somy, Ravdna Utsi; (4) Minna Mäkitalo Näkkäljärvi, Kristen Anne Grete Eira, Ragnhild Gaup Eira, Marit Alette Utsi, Solveig Kristine Oskal, Ellen Marit Oline Eira; (5) Ann-Irene Buljo, Inger Eline Eira Buljo, Inga Margrete Eira Bjørn, Lise Marie Skum Somy, Mette Anti Gaup, Tove Somy Persen, Berit Sara Somy, Berit Margrete Eira)

During the first 6 years, Sámi allaskuvla was governed by the Regional Board of Higher Education of Finnmark (*Det regionale høyskolestyret for Finnmark*). After a national reform of higher education in Norway of 1994, Sámi allaskuvla was allowed to establish its own Board consisting of internal and external members. In Norway, the Ministry of Education appoints external board members for all universities and university colleges, besides Sámi allaskuvla, because the university act requires the Ministry to involve the Sámi Parliament of Norway in the appointment of two of four external board members. Parliament's involvement has been a distinctive feature of the organizational structure of Sámi allaskuvla. As an important stakeholder, it has contributed to the institutional development.

Close contact between Sámi allaskuvla and Sámi political bodies in all the countries where the Sámi reside provides legal backing, endorsement, and a source of support for the institution. Partnership with the parliaments of Norway, Finland, and Sweden, as well as with the Sámi Parliamentarian Council, can be seen as part of Knowledge Reclamation. However, this partnership cannot replace the active reciprocal relationships with Sámi local communities.

The appointment of the first Board of Sámi allaskuvla in 1994 was a landmark occurrence that instigated a look back, to analyze the results, to consider the situation of the Sámi society of that time, and to look into the future. Along these lines, the strategic profile of the institution was elaborated (Sámi allaskuvla 1994). This strategic document presented the philosophy of the institution in a metaphoric way, describing foundation, priorities, and future perspective of Sámi allaskuvla as a construction of a traditional Sámi tent, *lávvu* in North Sámi.

Lávvu is a temporary shelter with a fireplace in the middle, designed to withstand high wind and rough weather. The basic structure consists of three wooden forked poles (*válddahagat*) which are interlocked and form a tripod. The straight poles (*lávvuorot*) are laid upon this framework of three poles in a circular fashion. The amount of the straight poles depends on the desirable size of *lávvu*. A cover tent, leaving a smoke hole in the middle, covers the whole construction. Sámi allaskuvla is metaphorically represented as a *lávvu* of Sámi education and research, which has three following basic poles:

1. Language and its advancement
2. Sustainable development and resource management by the Sámi society
3. Sámi education and Sámi comprehensiveness (Fig. 2)

Fig. 2 Traditional Sámi *lávvu*. Designed by Davvi Girji AS

Based on these poles, Sámi allaskuvla aimed to deliver educational and research programs in order to build capacity and develop indigenous skills and capabilities of the Sámi.

Construction of *lávvu* must have many poles in order to manage and solidly hold the cover, which represents the needs of the Sámi society. The straight poles laid upon the three main poles, represent other disciplines, needed for the institution to build the overall capacity of Sámi research and education. (Sámi allaskuvla 1994, p. 20. The author's translation from Sámi.)

In the course of more than 20 years, Sámi allaskuvla has followed this strategic vision. *Lávvu* are movable and can be taken by people wherever they go; can withstand all kinds of weather; provide people with warmth, care, and protection; and are socially important to keep families and their allies together. This is a Sámi metaphoric representation of the essence and the strong character and capacities of the institution.

Consolidation

Theoretical Framework

The theoretical framework for the following analysis of the advancement and outcomes of Sámi allaskuvla is based on transformative theory (Smith 2003) and analytical concepts of (1) Language Knowledge, (2) Knowledge Transfer, (3) Knowledge Creation, and (4) Knowledge Reclamation (Black 2014). These concepts originate from the Maori conceptual framework of *Mātāuranga Māori* that is a living art form grounded in traditional knowledge, that have been adapted for the Sámi context. These analytical concepts have been used to analyze the advancement of the institution and to make suggestions concerning the future prospects.

Language Knowledge

The first study programs were in teacher education, Sámi language and *duodji*, which is a Sámi concept for traditional handicrafts and arts. The first years were devoted entirely to teacher education for the preschool and primary and secondary school levels. In the beginning, there were about 20 employees involved and 40–50 Sámi students. The institutional budget of the first years was approximately 5 million Norwegian krona. Nowadays, the institution has around 100 employees, about 170 new students each year and an annual budget of about 80 million Norwegian krona.

The strategy of the institution was to educate Sámi teachers and other professionals to meet the needs and requirements of the Sámi society (Henriksen and Eira 2008).

These priorities distinctly followed one of the transformative strategies of indigenous education (Smith 2015, p. 73) as “a need to put our own indigenous languages, knowledges and cultures at the centre of our education revitalization.”

Sámi allaskuvla has been strategically focusing on issues and activities, which can be structured under the analytical categories of Language Knowledge and Knowledge Transfer (Black 2014). The priorities and strategic choices were always taken in regard to the Sámi language. Starting from the first teacher training courses up to the present-day doctoral program in the Sámi language and literature, the following focus issues related to the concept of Language Knowledge can be clearly identified in the profile of the institution:

1. Language Vitality

The use of the Sámi language in all activities, the Sámi language environment, the conducive environment for language acquisition, active language use and substantial improvement of language skills, arts and design, use of traditional sayings, irony and unspoken communication.

2. Language Essence

The empowering spirit of the language, the versatile and sophisticated terminology for things and issues important for the Sámi and their livelihood.

3. Language Identity and Distinctiveness

Appreciation of the command of different Sámi languages and dialects, the value of the language to maintain and strengthen Sámi identity, the fundamental language policy demanding, encouraging and fostering Sámi language skills among the staff, possibilities for the use of different Sámi languages in student examinations.

4. Language Excellence orally and in Writing

The positive open-minded arena for diversified and multiform language usage that allows a combination of the traditional academic language and oral traditions, storytelling and yoik, traditional metaphors and means of verbal and non-verbal communication, the development of writing skills for both the staff and the students.

In addition to these distinctive components of Language Knowledge, Sámi allaskuvla worked on the development of terminology for different fields of education:

5. Language Articulateness and Felicity

The challenge and ability to identify, both individually and collectively, appropriate and precise terms or expressions for theorizing and academic writing.

Focus on Language Articulateness and Felicity has been part of the institutional everyday life in all institutional activities up to the present day. Teaching by the means of the Sámi language needed a research base and practically proven lexicon in Sámi. This development has required constant intellectual exercises, collective academic, and political management of language issues by the national and

cross-border Sámi language committees. This also required communication with Sámi language academic circles at other institutions across national borders. One of the steps in this direction was the establishment of a Sámi language Research Journal with blind peer review, *Sámi dieđalaš áigečála* (SDÁ <http://site.uit.no/aigecala/>) in 1994 in collaboration between Sámi allaskuvla, Nordic Sami Institute, and the Department of Sámi Studies of the University of Tromsø, the northernmost mainstream university in Norway. (At present, SDÁ is published in collaboration between Sámi allaskuvla and the University of Tromsø.) The Research Council of Norway has covered the publication costs of the journal, while the involved institutions contributed with the human resources.

The journal has been an important source of Language Knowledge. Since its establishment, the journal has accepted and published research articles originally written in one of the Sámi languages. The articles cover a variety of research disciplines, such as linguistics, education, philosophy, literary studies, onomastics, sociolinguistics, history, study of religion, mathematics, and the research discussion on indigenous journalism, traditional knowledge, reindeer herding, resource management, climate change, and language technology, just to mention some. The academic staff of Sámi allaskuvla has statistically represented the majority of the writers of the SDÁ, thus actively participating in Knowledge Creation and Knowledge Transfer, and utilizing the energy and creativity that comes from Language Essence. The case of this journal should inspire other indigenous academic circles to rely on their Language Knowledge and believe in the very possibility of realization of a dream of writing academically in an indigenous minority language. In the course of almost 20 years, the editorial boards of the SDÁ managed to create and maintain a Sámi academic tradition of blind peer review, which might sound an impossibility in such a limited circle of indigenous language writers. Research articles of the SDÁ are used as curriculum at all institutions in the Nordic countries where Sámi is taught.

Language Vitality has been consciously chosen at Sámi allaskuvla as the main source of energy and inspiration. Sámi is the primary and strong working language of Sámi allaskuvla. The institution is situated in the Sámi language speaking community, where Sámi is the everyday language in all spheres of community life. Sámi allaskuvla took the concept of Language Vitality to a new proactive level and established its own language policy, demanding a command of the Sámi language from all the employees, regardless of the type of their working responsibilities, academic, administrative, or technical alike. All employees in permanent positions are required to be proficient in Sámi. Those who lack this proficiency are obliged to commit themselves to learn the language during the initial years of their employment.

This persistent language policy has been a great success, admired by many other Sámi institutions such as Sámi Parliaments and other organizations with a majority of Sámi speaking personnel. Employees without a command of the language usually learn the language very quickly in the energetic, spirited, and dynamic Sámi language environment where learning and speaking of indigenous languages is encouraged and highly appreciated. It is important to note that North Sámi has

been the main language. (There are ten Sámi languages/dialects, which are or were spoken across Sápmi (see Sammallahti 1998).) This brings challenges in terms of maintaining other Sámi languages at the institution. Concern about this resulted in establishment of a Center of Sámi language in education (*Sámi lohanguovddáš*) in 2013. The Center works primarily with reading and writing at all levels, from kindergartens to school and adult education in all the three official Sámi languages of Norway (North, Lule, and South Sámi). This development focuses on Language Identity.

The concept of **Language Identity** is applicable to Sámi allaskuvla in many ways. Sámi allaskuvla appreciates, takes into consideration, and displays the diversity of Sámi languages both in practice and in the content of the educational programs. Command of several Sámi languages by the staff is highly appreciated. Various kinds of support are given to the students whose mother tongue is different from North Sámi, although this always depends on the availability of resources. Resource deficiency can affect students, especially in their initial stage of language learning. Speakers of other Sámi languages can be obliged to use North Sámi, because the institution might not be able to provide education on and in other Sámi languages. The shortage of resources makes it difficult to correspond with the needs of various minority Sámi language groups. Making institutional priorities in the framework of limited state funding is always a challenge. The national “politics of distraction” – to use Graham Smith’s (2003, p. 2) term – sets provisions for reporting and standards for results which are not necessarily in harmony with what is considered to be a good result for Sámi communities. Sámi allaskuvla has the currently untapped potential to attract private or other kinds of external and non-governmental funding. For this matter, Sámi allaskuvla needs to elaborate its internal policy for fundraising, which should take into consideration ethical challenges, especially in regard to companies and individuals that make or intend to make profit from the natural or other resources in the Sámi areas. The institution can also get inspiration from other indigenous institutions worldwide, which find their ways of fundraising or profitable use of the resources available in their territories.

Knowledge Transfer

As an analytical category, Knowledge Transfer embraces the following fields and activities, which are identifiable in the profound philosophy and advancement of the portfolio of Sámi allaskuvla:

1. Interface of traditional and contemporary knowledge transmission implies traditional (Black (2014) uses the term “historical” that corresponds with the Maori context.) knowledge as basic component of Sámi higher education, formal academic appreciation of traditional knowledge, and connection between educational priorities and traditional foundations of Sámi culture in terms of study programs and research capacities.

2. Transition of understandings, experiences, and wisdom (Black (2014) uses the term “enlightenment.”) implies indigenous perspective in all subjects, development and use of Sámi pedagogy, employment of traditional knowledge holders as educators, experience and practice based language adult education, close collaboration with indigenous institutions internationally in terms of teacher and student exchange and multilateral participation in academic and educational activities.
3. Pathway to knowledge guardianship implies close relationships with communities as the owners of knowledge, indigenous ethical protocols for research and education.
4. Building learning potential for future implies that there is a need to look after students, to promote, and to facilitate capacity building of the staff.

During the first 5 years, Sámi allaskuvla developed compulsory and elective courses in preschool and schoolteacher education. Other study programs were developed in line with the strategic main poles (*válddahagat*). The academic staff elaborated courses looking from a Sámi and indigenous perspective, in the fields of pedagogy (among others, inspired by Freirean ideas of a liberating and emancipatory education and critical pedagogy), history, sociology, humanities, natural sciences, mathematics, linguistics, and sociolinguistics.

The first Bachelor program of Sámi allaskuvla was in the field of Sámi language and literature. The program started by the end of 1990s, following the requirements of Norway’s involvement in the Bologna process at the turn of the millennium. (Norway joined the Bologna process in 1999.) The Master program in the same field was accredited in 2008, and a PhD program in 2015.

The second and third strategic priorities of Sámi allaskuvla were articulated through study programs in duodji, reindeer herding and journalism. Duodji, one of the important bearers of Sámi tradition, was an important subject starting from the first classes as part of teacher education and further education for in-service teachers. The institution developed and obtained accreditation for a Master program in duodji (2011), which introduced the best practice of the traditional Sámi handicrafts into an academic program while maintaining traditional values.

Education about reindeer herding was initially part of teacher education, related to environmental issues, resource management, and traditional knowledge. Reindeer herding is one of the most powerful means of livelihood, a way of life that maintains and sustains Sámi traditions, language, and identity. Reindeer herding unites local communities of reindeer herders (*siida*) with their herds, territories, natural resources, traditional knowledge, kin, and other societal issues (Sara 2009). Eventually, a Bachelor program in reindeer herding was developed, primarily aimed at the Sámi who are involved in or connected to reindeer husbandry. The program provided students with a deep knowledge about the societal, environmental, biological, and legal aspects of reindeer husbandry. Close collaboration with the International Centre for Reindeer husbandry (located in Guovdageainu) has ensured a broad international content of this program. The Master program in reindeer herding was submitted for accreditation in 2016.

The need for professional Sámi language journalists motivated the development of a precourse in journalism in the early 1990s, and further the Bachelor and Master programs. The Masters program in Sámi journalism with an indigenous perspective was accredited in 2012 and was the first international program delivered in Sámi and in English, aimed at broadening the admission requirements and attracting Sámi and indigenous students. The first candidates graduated at the turn of 2016 (Rasmussen 2016 (in press)). The experiences of this international program and knowledge about success factors and possible shortcomings will be extremely valuable for the institution in its renewal strategies for the future.

Sámi teacher education is currently under structural reform in Norway. Sámi allaskuvla is developing Masters programs in teacher education with Sámi as a language of instruction. This opens possibilities and creates challenges for a small institution, in terms of covering the needs of the Sámi schools in a diversified landscape of many strongly endangered Sámi languages.

Starting from its early establishment, Sámi allaskuvla has offered beginning courses in Sámi for adults and has developed an efficient methodology of language teaching. This course has attracted hundreds of students, the majority of whom have been Sámi who wished to take their indigenous language back. This method of language acquisition and the capability of the institution to provide a genuine language environment can be seen as both Knowledge Transfer and Knowledge Reclamation. These experiences suggest future potential for institutional development, and comprise one of the sites of ongoing struggle alongside with the communities, Sámi language centers and other organizations, and individuals.

Pathway to knowledge guardianship means awareness about the value and collective character of traditional knowledge. Following the basic principles of indigenous methodologies, Sámi allaskuvla has used Sámi and indigenous concepts, indigenous knowledge, and experiences in knowledge building, theorizing and education. This also entails giving credit to people for sharing their knowledge, respecting the local knowledge, and making Sámi internal cultural diversity visible. Communication with communities and the employment of the elders as teachers and supervisors requires reciprocal relationships. Communities are the legal owners and possessors of their traditional knowledge (Porsanger 2011).

One of the strategies of securing knowledge guardianship and creating indigenous academic space for Sámi allaskuvla was to join the World Indigenous Nations Higher Education Consortium (WINHEC). Academic staff were involved in an energetic and enthusiastic way in collating all of the required accreditation documentation, and acquired Sámi political support. The Sámi Council (letter of support 29 June 2006, Nr 74/2006) acknowledged Sámi allaskuvla as “an important contributor to the development of the future of the Saami people, emphasizing the traditional knowledge and traditional cultural expressions of the Saami people in their educational programs” and approved the institution’s vision to be accredited as a Sámi University. In the context of the prevailing hegemony of mainstream education in Norway, the obtaining of WINHEC accreditation in 2008 has been a successful strategy of Sámi allaskuvla to create its own indigenous space. Moreover, this accreditation has provided the institution with the international framework

for quality assurance in indigenous education (about the framework of WINHEC, see for example Anning et al. 2012). WINHEC requires a mid-term report (5 years cycle) and a report to confirm accreditation every 10 years; however, some experts believe that maintenance of the ongoing quality assurance after accreditation is granted might need more attention (Jacob et al. 2013). Nevertheless, WINHEC sets high indigenous standards, which could not be met by any mainstream university or university college in Norway and most likely neither in other Nordic countries.

WINHEC accreditation has been seen as a strategy to reclaim equity definitions and change the status quo in favor of a small Sámi language tertiary institution. As an accredited member, Sámi allaskuvla has more quality assurance authorities to deal with than any other national tertiary institution. This corresponds with an emancipatory strategy of “Re-claiming equity definitions from the neo-liberal economic hegemony that tends to argue against compensatory forms of equity in favour of the ‘level playing field’ form of equity that simply entrenches the ‘status quo’” (Smith 2003, p. 7). Approval of WINHEC research ethical standards in 2012 was another step toward securing knowledge guardianship and Knowledge Reclamation (Sámi allaskuvlla dutkanetihkka 2016). The ethical standards articulate Respect, Reciprocity, Reliability, and Relevance as important key issues (Porsanger 2008, 2010, 2014), and are meant to fulfill the requirements of Indigenous peoples and their knowledge communities. This remarkable advancement in terms of indigenous research ethics deserves much more attention by the mainstream academics and Sámi scholars employed by the mainstream institutions. There is therefore a need for Sámi allaskuvla to display and articulate more distinctly these research guidelines in its research activities and in dissemination of research outcomes.

Building learning potential for the future has been one of the main arguments behind the establishment of Sámi allaskuvla. According to the national statistics (Database for Statistics on Higher Education, <http://dbh.nsd.uib.no>, in June 15, 2017), about 2,500 students have been examined at Sámi allaskuvla since 1989. Taking into consideration that there are about 25,000 Sámi speakers in the world, one can see that Sámi allaskuvla has had a tremendous impact on Sápmi in terms of indigenous higher education. There is a need for a future review that could show the impact of Sámi allaskuvla, involving Finland, Sweden, and Russia in addition to Norway. Such an investigation would show achievements, as well as needs and challenges. However, looking from a point of view of general knowledge and lived experiences, one can see that the former students of Sámi allaskuvla work nowadays at schools, kindergartens, political bodies both as politicians and managers, in social services, research, tertiary and vocational education, handicrafts, and the media.

Strong personal connections between the staff and the students have always been an important focus for Sámi allaskuvla up until the present day, when the institution has grown almost five times bigger than it initially was. While direct connections are not typical for larger institutions like universities, they represent a distinctive feature of most indigenous institutions in the world (Dutton et al. 2016). Sámi allaskuvla and likeminded indigenous institutions endeavor to support students’ success, looking

after both the students and the staff. This is no doubt the strength of indigenous institutions; but management of these connections and utilization of the potential of these relationships is a time consuming and challenging practice.

In the period from 1989 to the turn of the last century, the majority of students were mature and aware of the need for formal education. During the last 10–15 years, more young students have joined educational programs. This demographic feature must attract institutional attention in term of future recruitment. In order to achieve further positive transformation (Smith 2011), more attention should be given to ensure equal emphasis and accountability on access, participation, retention, and success of all students. This will result in strengthening the institution's own indigenous space in the Academy for indigenous development and advancement.

In the spirit of critical pedagogy, Sámi allaskuvla has always treated students as knowledge holders and not as empty vessels to be filled (Keskitalo et al. 2013). The institution has had a commitment to do its very best in solidarity with students. By acting together in a Sámi environment and by the means of the Sámi language, the objective has been to transform education.

Knowledge Creation

Giving priority to Knowledge Creation, Sámi allaskuvla has been forging new Sámi academic pathways for future engagements, generating potential new knowledge acquisition, creating knowledge resilience and capability, and building relevant and effective research experience. These multiple sites of Knowledge Creation bring about:

1. Development of curriculum options around Sámi interests
2. Capability building by uplifting the skill and leadership level of the academic and administrative staff
3. Motivation and inspiration of the staff and the students to develop and use indigenous and Sámi approaches to knowledge creation and production
4. Further development of Sámi pedagogy as inquisitive, transformative, dialogic, dialectic, and liberating interdisciplinary research-based knowledge production
5. Capacity building by encouraging potential staff members to work in Sámi higher education, and by motivating potential students to acquire Sámi higher education

In the course of almost 30 years, the capacity building efforts of Sámi allaskuvla have resulted in six professoriates. The first professoriate was in the Sámi language, and the second one in Sámi knowledge and philosophy. One-third of the academic staff have achieved doctoral degrees in different fields of research. Sámi language courses for managers and administrators were developed in order to deliver good quality management in the Sámi language. According to the most recent international expert assessment of Sámi allaskuvla, conducted under the auspices of the Norwegian Agency for Quality Assurance in Education (NOKUT) in 2014, the size and quality of the staff and their collective competence is considered as outstanding.

The international expert committee found the scientific staff being well qualified within their respective areas, covering together a wide range of fields within Sámi studies, including minority and indigenous perspectives (Expert report 2015).

The turning point of consolidation of Sámi research happened in the period 2005–2009, when the Nordic Sami Institute was co-organized with Sámi University College in 2005. This was no doubt a demanding and uneasy merging process, which implied incorporation of quite different academic cultures and assimilation of a formerly relatively independent and internationally funded research institution into a tertiary system subjected to the Norwegian educational framework. For the Institute, it meant an amalgamation and formal dissolution, but for the merged institution it required a shift to a qualitatively new level of research activities and research culture. The Nordic dimension of research of the institution 10 years after merging was recently evaluated by an international panel of experts, which concluded that Sámi allaskuvla has

created a highly effective **research hub for Sámi studies research** that conducts cutting edge indigenous studies research of its own and that sustains and advances a **pan-Nordic network** of researchers and institutions committed to Sámi studies and to indigenous studies. On an international plane, the SUC [Sámi allaskuvla] has acted as an important partner with indigenous studies researchers and institutions across the world, providing an innovative model for how indigenous elementary and higher education can be advanced and bringing the Sámi case into productive engagement with situations and examinations of other indigenous communities. (NordForsk 2015, p. 16)

The legacy of the Nordic Sami Institute incorporates the area of indigenous rights into the institutional portfolio, since the Institute has a long tradition and qualified human resources in the study of law and customary rights. Education about legal aspects and Sámi customary rights is becoming a fundamental part of study programs in reindeer herding, resource management, teacher education, studies of language and sociolinguistics, pedagogy and schooling, and media.

Another noticeable result of merging was the tremendous lift in the level of research-based publications. Since 2007, Sámi allaskuvla has been among the leading institutions of the same scale (national university colleges) with respect to the amount of research publications in relation to the amount academic positions. The leading position of Sámi allaskuvla shows the institution's potential and strength. The establishment of a strong institutional research leadership and continuing strategic allocation of funding might in the future result in research outcomes in a more profound way. Even if the direct impact of research-based publications on Sámi communities can be disputable, publications contribute to increase of curriculum options. It is worth mentioning that Sámi allaskuvla has had a national responsibility for the development of the Sámi language as a language of research. The *Sámi dieđalaš áigečála* has made an important contribution to this field.

Research at Sámi allaskuvla in general can be seen as an intergenerational laboratory for Sámi cultural innovation, societal self-determination, and artistic and economic advancement. This site attracts the attention of various mainstream universities and organizations wanting cooperation and access to genuine indigenous

knowledge creation and competences. Nowadays, traditional knowledge and expertise in this field is becoming more and more attractive for the mainstream academy worldwide. A growing need for international research funding is inevitably connected to establishment of partnerships. However, the challenge is to maintain indigenous integrity and to protect indigenous expertise from misuse and indigenous knowledge from misinterpretation (Porsanger 2004). This dilemma of a small but strong indigenous Sámi language institution might be seen as a kind of internal protectionism, but in the long run the question is about indigenous self-determination, respect for traditional and language knowledge, and Knowledge Reclamation. Sámi allaskuvla has established cooperation with partners in indigenous studies and research in the Arctic and worldwide, as well as with mainstream institutions in Norway and the Nordic region. The legacy of the Nordic Sami Institute has played an important role in the maintaining and widening of research networking.

Sámi allaskuvla regularly organizes and hosts international indigenous research conferences and other academic activities in an array of topics. These events always attract indigenous scholars, as well as the mainstream circles, from Canada, the United States, Aotearoa/New Zealand, Australia, Taiwan, Japan, Russia, and many countries in North and South America. Scholars from Sámi allaskuvla are often invited speakers at various research conferences and international events worldwide. There is still a need to actualize a call for indigenous theory in a Sámi context, to analyze upgrowth and outcomes of transformative indigenous education, to produce new knowledge based on indigenous and Sámi epistemologies and philosophies, and to shorten the gap between research and Sámi communities. Research and education in the local communities might be one of the strategies for achievement of this goal.

Knowledge Reclamation

Knowledge Reclamation is an ongoing struggle of any indigenous institution in the mainstream educational system. For Sámi allaskuvla, many of the following aspects are underlying the future advancement:

1. To retain and maintain knowledge and scholarship
2. To create multiple pathways to knowledge and scholarship
3. To strengthen scholarship acquisition and competences

In the Sámi context, one more aspect is to be added:

4. To strengthen legitimacy of indigenous traditional knowledge and to work in close collaboration with communities to retain, maintain, and protect it

At the present, the use of traditional and local knowledge has become more and more desirable in decision making processes. In Norway, a recently adopted Biodiversity law (*Naturmangfoldloven*) confirms the significance of inclusion of

traditional knowledge in resource management. This trend opens up possibilities for the development of study programs and research activities aimed at documentation and securing of traditional knowledge and skills in Sápmi. Sámi allaskuvla has already started building up a field of traditional knowledge in order to enhance competence and to promote the legitimacy of traditional knowledge and skills. However, there is a need to implement this objective in an appropriate and ethical way, treating traditional knowledge as a legitimate and authoritative source of information in the mainstream system of resource management (Porsanger and Guttorm 2011). This work is part of Knowledge Reclamation. Sámi communities, museums, language centers, schools, and kindergartens all around Sápmi are in a great need of a formalised and deep knowledge about documentation, protection, maintenance, dissemination, teaching, and storage of Sámi traditional knowledge.

Lifting of the academic level and competence is another site of struggle for Knowledge Reclamation, which is manifested in a desire of Sámi allaskuvla to establish doctoral education. The field of Sámi language and literature has been strategically chosen for the first doctoral program, which is grounded in indigenous understandings, epistemology, and competence. The planning work took many years starting from the examination of the first cohort of the master students in this field. The PhD program was accredited by NOKUT in 2015 and started in 2016. The entire process of elaboration and accreditation of this program allowed Sámi allaskuvla to mature substantially as an academic institution.

Although the institution envisioned long-ago the need to develop its own doctoral education in indigenous language, the institutional framework was not in fact prepared for the tremendous amount of work required for the establishment of doctoral education. It was not the doctoral program per se which needed to be designed. Rather, the institution had to build up and approve the whole framework and infrastructure of doctoral education demanding the design of legal, research ethical, administrative and other regulations. Today, this comprehensive and immense work is done and the academic and regulative infrastructure is built. Now Sámi allaskuvla is able to develop doctoral programs in other fields of research, if such priorities are to be set as reasonable in the future. These experiences can serve as the guiding Morning Star for other indigenous institutions.

Along the way to accreditation of the doctoral program, Sámi allaskuvla met an extraordinary obstacle. Being an indigenous institution and serving the needs and interest of an indigenous minority, Sámi allaskuvla was not able to fulfill the quantitative requirements of the Norwegian Ministry of Education and Research regarding quality assurance and quality development. It is required a number of 15 PhD students within the first 5 years, and further there shall be 15 or more students in the program at all times to ensure an efficient learning environment.

Sámi allaskuvla used its entire professional and leadership capacity to reason, argue, present evidence, and get support of the bigger universities and Sámi political authorities, in order to get an exemption from this quantitative requirement. Many influential institutions supported the Sámi argumentation: the Sámi Parliament of Norway and the Sámi Parliamentarian Council, the Norwegian Association of Higher Education Institutions, and such comprehensive universities as the Universities of

Tromsø, Nordland, and Bergen, just to mention some. The international expert committee evaluated the doctoral program and strongly recommended granting an exemption. The Panel of Experts recognized the absolute necessity for research and research infrastructure aimed specifically at Sámi communities, and concurred that Sámi allaskuvla was well prepared for the doctoral education and was able “. . .to serve as a role model also for other indigenous people and research organizations around the world” (Expert report 2015). This struggle was without any doubts part of Knowledge Reclamation.

Renewal

Since the establishment, the institutional aspiration and desire has been to become a specialized Nordic or pan-Sámi indigenous university. The establishment of doctoral education formally allowed Sámi allaskuvla to change the English translation of the name of the institution in 2015 from being *Sámi University College* to become *Sámi University of Applied Sciences*. (The Norwegian Ministry of Education and Research allowed university colleges with the accredited doctoral programs to carry a designation of “a university” in the English translations of their names, in order to communicate internationally the high academic level of their education.) The national mainstream systems have their own accreditation criteria for achieving a formal university status. In the indigenous and minority context, it is usually a mission impossible for any indigenous institution to meet the mainstream criteria. Moreover, the mainstream universities usually monitor and contest indigenous institutions’ endeavors to be called universities (Smith 2015). For Sámi University of Applied Sciences, the university designation is more than just a translation. It is rather a visualization of the aspirations of the institution and justification of the broad and deep character of Sámi indigenous language education on its own terms and rights.

The time has come for Sámi University to critically reflect on its history of struggle, incremental changes, challenges, achievements, shortcomings, and success. There is a need to consider challenges of the present day and the future, to find Sámi ways to advance nationally and internationally for the good of the broadly defined Sámi society of the twenty-first century and for the international indigenous world. Sámi University needs to further build on the successful elements of the advancement of Sámi language education and research. In addition, the institution needs to reposition itself within the emerging spaces of the postcolonial context, which has become a site of contestation in indigenous education and research. There is a need to become more aware of the limits of the institution, and be willing and theoretically and practically informed to challenge these limitations. On the way, inspiration and support can be earned from Sámi communities, as well as from collaboration with other indigenous educational institutions, indigenous universities, tribal colleges, as well as the postcolonial universities. The potential partner institutions need to be open to academic freedom on indigenous terms. They need to be

sites of unconventional thinking and creativity not only within their own university profiles, but also within indigenous education and research.

In the context of the transformative theory, Sámi University has been successful in the implementation of the need to put Sámi language, knowledge, and culture at the center of Sámi education, and in the absolute need to make and lead transformation of education by ourselves. There are at least two essential elements, which will catalyze further development and renewal:

- A need to centralize the need of transforming
- A need to become more literate about new formations of colonization

This implies looking critically in a Sámi way, based on the Sámi theory of knowledge, conception of reality and value system, at the circular praxis of transformation, where a cycle of Conscientization–Transforming–Resistance can be entered from any position (Smith 2015). This kind of analytical and reflexive thinking may be a strategic reinvestment in theoretical tools to assist energetic further development of the institution.

There are several reasons for a need for Sámi allaskuvla to utilize the lived experiences and to move forward, to reconfigure its position in Sápmi and internationally, and to articulate its role in the present and the future. The following list is very much inspired by the praxis and theorizing of the Sami and other indigenous scholars (especially by Keskitalo 1997; Kuokkanen 2008; Smith 2011, 2015; Andreotti et al. 2011):

- A need to have a critical site for understanding how colonization works in its present formation, in order to be able to respond appropriately.
- A need to develop and teach tools that help Sápmi across national borders and indigenous peoples internationally to unpack colonization into resistance and development on their own terms.
- A need to grow in student numbers and become a site that attracts broader range of Sámi students, both with Sámi language skills and especially without such skills, in order to develop a critical mass of linguistic, cultural, and intellectual change-makers.
- A need to always keep in mind that indigenous students are entitled to the best. More attention should be put to ensure equal emphasis and accountability on access, participation, retention, and success of the students.
- A need to focus on the contemporary Sámi means of livelihood and emerging Sámi economy and its associated work force needs, to assist building work opportunities and employment that derives from Sámi ways of livelihood, priorities, and community interests.
- A need to utilize social capital of the Sámi society across national borders, to broaden responsibility to embrace Sámi communities. A need to develop continuous and persistent learning spaces and multiple pathways of learning in the communities and together with the communities. There is therefore a need for establishment of several sites of Sámi education located in the

communities all around Sápmi in order to link effectively to the local needs and expectations.

- A need to utilize modern technologies for online education, which embrace the essential features of indigenous education.
- A need to create a more powerful and collaborative community of scholars, nationally and internationally.
- A need to understand and heal the divide between Sámi communities and the academy, and to find strength in this collaboration.
- A need to advance internationally, to utilize in a greater extend existing and potential international networks with indigenous and nonindigenous institutions of higher education and research.

There is a challenge to keep the Sámi language as a focal point and simultaneously broad and deep in terms of the diversified Sámi and indigenous context. Additionally, an epistemological pluralism in higher education makes the development prospective even more challenging. For the educational purposes, the institution has to deal with “controversy in higher education to improve students’ analysis, promote intellectual freedom and equip students to engage with complexity, diversity and uncertainty” (Andreotti et al. 2011, p. 45). For the research purposes, it is essential to enhance proactive research for transformation in a diversified sociolegal cross-border context of Sápmi.

Conclusion and Future Directions

For almost 30 years, Sámi allaskuvla has been educating Sámi people; formalizing their competences; strengthening their language skills; providing with knowledge of indigenous contexts worldwide; reflecting together with the students on the past, the present, and the future; and giving formal education in the areas that are important for the Sámi culture. In this process, traditional knowledge and the Sámi language have always been the key issue, the means of all activities, the sources of energy, power and inspiration, the sources of knowledge, and theorizing. Capacity building for the Sámi has been the main priority.

In the future, Sámi University shall continue to develop and deliver educational and research programs in closer collaboration with Sámi communities, building a critical mass of linguistic, cultural, and intellectual change-makers all over Sápmi across national borders. International advancement shall be strengthened through an operational and proactive cooperation and networking, which is capable of enriching and inspiring all cooperation bodies, academic staff, and students. As a result, new, internationally oriented and locally necessary educational programs can be created. This will build work opportunities and employment and assist development of Sámi and other indigenous communities with their culture and identity. Further elaboration of Sámi theorizing will contribute to knowledge production, which indigenous communities need and require, and which can enrich both the mainstream academy and the growing body of indigenous research worldwide. This is the way to reach out

the main vision of Sámi allaskuvla to become Sámi and Indigenous University, where Sámi language is used orally and in writing, and where indigenous peoples' values and thinking are at the center of knowledge and capacity building. According to the recent strategic plan for the period 2017–2021, Sámi University envisions further development of Sámi and indigenous communities, means of livelihood, languages, and cultures on their own terms.

Sámi University has shown a great innovative, advanced, progressive, and unprecedented development potential. This institution is able to create a space for the Sámi and other indigenous people, especially the young ones, and the like-minded peers nationally and internationally, to maintain and develop indigenous identity, and to extend self-development and political sovereignty. The institution has both an ability and a renewing potential to continue and to augment its leadership in the Sámi and in indigenous education. There is a space for the institution to reimagine itself as a guiding Morning Star showing directions in a broader Sámi and indigenous context, to deliver liberatory education and research that enables to transform Sámi and indigenous societies for the better. The metaphor of a Sámi *lávvu* and the poles that are chosen in respect to a desirable size and the amount of people to accommodate can inspire a renewed and empowering further advancement.

Abstract

No matter what academic discipline one pursues there is a concept, a theme, a topic, a subject from the history, culture, experiences, and indigenous knowledge systems of the formally colonized that has been excluded from mainstream discourses either because they did not fit in the academic codes and classifications or because they were considered superstitious, irrelevant, and of no use to human development. In this chapter, the authors argue that indigenous-based epistemologies are essential for transformative education. Afrology is presented as an African-centered epistemology, and it is the underlying philosophy of the proposed decolonization process. Nabudere (2006) defines Afrology as: “a philosophical, epistemological and methodological approach that emphasizes that Africa’s achievements are recognized” (p. 7). With this concept, the chapter illustrates possible ways through which every/any education topic in the indigenous learning context can include a research for identities, revitalization

of indigenous cultures as well as an integration of the indigenous epistemologies with other knowledge systems. Emphasis is made on the use of indigenous research frameworks and the use of indigenous cultural values to identify gaps in current mainstream education. The approach presented here facilitates educational transformation for indigenous peoples through research with education as a source of curriculum agenda, content, and teaching strategies. The authors argue that Afrikology should guide a research using the epistemological treasures found in indigenous education art, crafts, music, games, traditional story, and performances as indigenous research data collection and teaching methods.

Introduction: Urgent Need to Research, Decolonize, and Transform Education for Indigenous Peoples

Discords in Current Practices

Rain, rain go away!
 Come again another day.
 Little Tommy wants to play!

In a primary school in the Kalahari (the land of the indigenous San people), children can be heard chanting the rhyme above during their English lesson. In the next session, the teacher may be reading a story which begins like: “It was a nice sunny day when . . .” In the Art and Crafts sessions, it is not uncommon to find on walls of classrooms snowmen, snowflakes out of paper, or a giant Santa Claus.

The country’s currency’s name *Botswana Pula* translates to rain, which signifies the value of this weather condition. It is equally absurd and inapt to instruct children to craft snowmen, snowflakes, and Santa Claus in a country where it never snows. These items and concepts are far removed from the children’s physical experiences, their cultural contexts, and tacit knowledge of the world in which they live. Throughout this chapter, examples are provided as tools for reflexivity, to prompt readers to research their own educational practices some of which may have been adopted blindly from the colonizing forces. By encouraging reflexivity, the authors knock at the educator’s door and hope that he/she joins in the struggle of educational research to find ways through which education can be transformed for inclusivity and suitability for learners in any situation. It is only through reflexivity and willingness to change, that the first steps toward educational transformation and decolonization can be taken.

It has to be acknowledged that many indigenous education practitioners have internalized colonization and have come to equate their cultural heritage to

backwardness. Akena (2014) describes the extent and effects of colonization on the minds of “educated” indigenous peoples, he argues:

. . . European educators demanded that African schoolchildren reject their own “primitive and pagan” customs in order to embrace the new, civilized ways of learning and living. This automatically meant that schoolchildren and anyone who desired the new, civilized way should cut themselves away from the Indigenous influence of families . . . It is the painful colonial legacy in which the seed of inferiority and unassertiveness were implanted into the colonized minds that makes it hard for them to form a united front in the struggle for recognition of their Indigenous values, belief systems, and ways of knowing. (p. 35)

Akena further asserts:

The Westernized African nationalists and bourgeoisie who took over power from former colonial masters have betrayed the cause of decolonization. They have protected the economic interests of the colonial masters, are weak, and lack the financial resources to boost their economy. Many African nationalists and bourgeoisie appear to want to belong to the colonial world, to monopolize commerce and dictate government policy. (p. 83)

In agreement with Akena, the authors of this chapter argue that even where Eurocentric colonialism has been reduced, ethnic oppression still reigns and determines the discourse in education. Africans who went through Western education, mostly members of dominant ethnic groups, bring this colonial mindset into their duties of developing education policies, curricula, text books, and teaching. Education for indigenous people, therefore, tends to function within colonized frameworks. This puts ethnic minorities and indigenous peoples at a great disadvantage as they are exposed to education which is double-laden with colonialism – both Western imperialism and ethnic oppression (Khudu-Petersen 2007). Therefore, if education is to be transformed, activists (researchers and educators included) have to be brave enough to endure official resistance and social ridicule.

Official resistance can be perceived in situations where the use of learners’ mother-tongue is forbidden in class and in some cases even on the whole school premises. According to Badejo (1989), Botswana is one of the Sub-Saharan countries in which the government has the good intentions of providing development programs to all, but excludes a vast majority of the population from this benefit by a condemnation of indigenous languages in public/official spaces:

[The government] . . . publicly declares its intention to involve the entire population in its development programmes, but then forbids the use of indigenous languages in schools allegedly because they cannot express modern scientific concepts. Yet, the vast majority of the population can only function in these ‘condemned’ languages. (p. 51)

Decolonization and transformation of education for the benefit of indigenous peoples and marginalized minority populations should start in the classroom, spearheaded by education practitioners. Colonization is already deeply entrenched in indigenous societies; there are symptoms of rejection of indigenous cultures by indigenous peoples. Therefore, researchers and educators supporting transformation

need to be alert to these facts and find compromises in order to achieve change, while considering realities surround indigenous populations. To illustrate the entrenched social rejection and resistance toward living between the so-called “modern” or the urban life and traditional rural life, a rhyme is cited here:

Mma Tshwene, Mma Tshwene
ka boribanyana, a a ja bogobe ka leswana,
a isa makgabe toropong,
a isa makgabe toropong!

The chant roughly translates to: “Mma Tshwene, the baboon girl, with her ugly face and naivety, eats traditional porridge with a metal spoon and she wears her traditional bead skirt to the city!”

The implication here is for people to let indigenous practices and cultural artifacts remain where they belong; in the traditional “uncivilized” rural places. A metal spoon is too good to use for indigenous food. One should be ashamed for wearing traditional clothes in the city. In the face of this strong resistance, this chapter affirms the practice of educators who have dared to counteract the criticism by applying methodologies which are relevant to the indigenous learners and opening doors to indigenous arts, drama, and music as tools for learning. Chanting this rhyme is most common in rural villages, where it would be expected that indigenous traditions reign. However, with the unconscious, internalized colonization, the children happily and innocently chant rhymes and sing songs such as the above.

Although we are far from defeating colonization, Edwards and Brannely (2017) have identified a decolonization agenda pushed by researchers in colonized countries across the world (e.g., Chilisa 2011; Kovach 2015; Smith 2012). These researchers aim at transforming research and decolonizing education by detaching “. . . what counts as knowledge, its production and how it is used, from imperialism” (Edwards and Brannely 2017, p. 273). Much like the proposition made by the authors of this chapter, which is to reconstruct canonized knowledge so as to accommodate Indigenous Knowledge, the contemporaries of transformative education aim to create a space for different ways of knowing through the use of methods in which indigenous peoples are not subjects, but active collaborators. The implementation of collaborative educational inquiry creates chances to unearth indigenous epistemologies and place them at par with existing knowledge systems.

It is time for education practitioners to push the current education systems and other social structures toward decolonization. This can be best achieved by indigenous peoples themselves. However, according to Battiste (2004), the journey of transformation:

cannot be achieved by Indigenous peoples alone but has to be collective collaborative work as . . . These collaborations should also draw from the rich but neglected knowledge that is already available. This transformation does not come easily, as many Indigenous people recognize the damage that many researchers have inflicted on them and resist research that is appropriative and not beneficial to them. (p. 9)

Strategies for Decolonization and Transformation of Education

Against this background, education practitioners should reflect upon their teaching methods to evaluate whether their work is based on transformative practices that would allow indigenous epistemologies to have significant meanings in education. Considering the first classroom example given at the beginning of this chapter, one sees the works of a colonized mind which prevents the teachers from understanding the sense of the rhyme in order to adapt it to the learner's environment. The rhyming words in the chant are: Rain, again, play, away and day, if the English Language syllabus requires teaching these words, a teacher who is conscious of his/her environment, mindful of the ethnicity of the learners would teach the same words, packed in a relevant context:

Rain, rain . . . comes today!
 And come again another day
 Cool the sand so we can play
 Sun, sun you are going to fail
 Because cool rain will come today!

With the rain rhyme turned around, the teacher reaches the aim of the English lesson, but even more importantly, draws the children's attention to the weather conditions in their land. The content is relevant to dreams of the children, who wish to play in cool and wet sand. Instead of wishing rain away, Kalahari children will now be empowered to chant a rhyme in English from the bottom of their hearts, to pray for rain on a hot summer day! The adults, who understand English, are likely to appreciate the voices of children calling to the ancestors to send some rain! The rhyme as adapted here exemplifies a transformed education practice which is likely to be palatable to indigenous learners and their parents. Such practice has a chance to reduce alienation and garner support from indigenous communities. Alienating and colonizing education has been observed in the Botswana context as harmful and counterproductive, for example, Mokibelo (2016) citing a report by Letshabo (2002) state:

San children's parents do not have equitable opportunity to visit school due to their life style of hunters and gatherers and cattle herding which is also based on subservience. Even when an opportunity is presented parents do not visit the school mainly because school promotes, in the parents view, a culture that is foreign to them. In this respect, parents of San ethnic minority children may not be able to solve problems their children are experiencing at school and again will not create a relationship with school authorities necessary to develop their children. In this regard, early childhood care is not nourished by the school for both the San and BaZezuru. (p. 167)

These disadvantageous conditions necessitate a research of practices to diagnose the holes through which valuable indigenous education slips. It is evident then that adaptation and not adoption should be the *modus operandi*. Blind adoption of Eurocentric content and their means of transmission should be avoided at all costs.

Of course, education practitioners may be skeptical of these thoughts because they feel constrained by the prescribed timeframe, the rigid curriculum as well as the methodologies they are equipped with. Analyzing indigenous wisdom as a contribution toward the transformation of education, educators could justify and “legitimize” it by placing it within the realms of allowing research and experimentation into the classroom. In this mode, learners could be given a chance to use their own knowledge and to some extent learn at their own pace and in learning methods suitable for them. In a modest way, knowing the self, owning knowledge, and determining the methods and pace of learning can be seen as steps toward the decolonization process.

This chapter facilitates the decolonization and transformation of education by urging educators to open their minds and their classroom doors for environmental influences and accommodation of indigenous knowledge. However, in adapting “uncommon” and “informal” methodologies, teachers should not expect to easily sail through without resistance from authorities who are still shackled by rigid methodologies that push indigenous knowledge frames out of education systems. The observation shared in this chapter is that even in the postcolonial period, Sub-Saharan African societies still experience oppressive ideologies in which they are compelled to adopt formal education brought by colonial regimes from European countries.

Formal institutions including school were and still are modeled on Eurocentric patterns: official dress code, classroom arrangement, hierarchical management structures, official language and even sporting games, art and craft, music, and other forms of play. This structure is what is known as “civilization” through formal education. This so-called civilization disparaged and even outlawed a lot of African values and practices. The oppressive structures negatively affected Africans, in their sense of trust and respect for indigenous epistemologies, sense of identity, and pride in their own cultures. These practices may have contributed to the erosion of indigenous knowledge by elevating colonial cultures through education, religion, and historical manifestation over the indigenous values. The same idea was expressed succinctly by Akena (2014) citing Wane (2006):

Certain structures and institutions were required for the social and cultural invasion to effectively materialize in non-European societies. According to Wane (2006), these structures and institutions, like formal schooling, facilitated rewriting the history of the colonized subjects to deny their existence, devaluing Indigenous knowledge, and debasing cultural beliefs and practices. The mechanism that enforced this was the Western system of education, texts, and literature, thereby making the business of education and knowledge production contested terrain. (p. 83)

To go against the imperialistic force (which reigns even in the postcolonial period), educational practitioners should stay vigilant and interrogate the content of the curriculum and the prescribed methods of transmission they are instructed to use. Educators should employ principles of Afroecology, by implementing the accommodating indigenous ways of knowing while they also realize the canonized Western-based educational goals and curriculum materials. An example of such

transformative action can be viewed in the actions of a lecturer who shall be referred to as Dr. Bashaga (not her real name). As an Art Education lecturer, she came across a topic in the primary school syllabus (Creative and Performing Arts CAPA) where learners were instructed to draw their faces and those of their parents and siblings.

Dr. Bashaga reflected upon the frustrating experiences she had whenever she tried to introduce her family to European or American friends; her explanations of the relationships between family members seemed too long and confusing for them. Their confusion about the seemingly complex relations in indigenous cultures would often lead friends to impatiently conclude the conversation with “whatever!” The lecturer realized that this lack of understanding of the complexity of African family structures by people from Western cultures may contribute toward the loss of ethnographical information, which is anchored in indigenous knowledge systems. This depletion of indigenous knowledge particularly in formal setups could have a domino effect through which numerous indigenous cultural practices could be erased, denying indigenous learners the chance to retrace their histories.

Dr. Bashaga, therefore, decided to divert from the textbook and curriculum-prescribed methodology for the art project dealing with the topic “My family.” She made an effort to fight against the loss of valuable indigenous cultural material when she employed African-based routes of teaching a topic in which children were instructed to draw the faces of their nuclear family. In her teacher-education course, Dr. Bashaga challenged her teacher education students to engage in an exercise which would train them to take their learners beyond drawing the faces of their nuclear families, but to instead paint a tree in which the roots represent a generation, and the stem, branches, leaves, and fruits would represent other generations respectfully.

This exercise proved not to be as simple as it may sound because the student-teachers had to examine their own history, and analyze their familial and social relationships in the African context. The paintings that came from this exercise were interesting and were often (even where they were abstract) interpreted by viewers as reflecting unity or harmony and illustrating lineage. A corresponding play on family relations was composed and the whole class played roles of family members. The play clearly demonstrated that African family relations do not end with mum, dad, sister, brother, cousin, uncle, aunt, grandmom, and granddad. With the example of Dr. Bashaga, the authors of this chapter conclude that Art can be an important tool of decolonization and transformation. Albers (1999), cited by Khudu-Petersen (2008) states:

Art offers us something seldom seen in other content areas of the curriculum: an immediate emotional and intellectual response to other perspectives. Unlike the texts in many other content areas which take an abundance of time to read, with art, we stop, we respond, we reflect -often in a matter of a few moments. Art, then, takes on a powerful and pivotal position in the curriculum. (p. 10)

Educators are therefore urged to tap into indigenous arts and use them in the classroom because the arts provide ways through which a nation and ethnic groups can examine their own images, making their identities, their social connections, and

their cultures tangible and realizable. Every culture has its own artistic expressions; indigenous educators should, therefore, take advantage of all art forms as important tools for decolonization and transformation of education, as it was the case in the project described.

From Dr. Bashaga's example, we do not only learn how cultural material can be utilized through art projects, but we also realize that ethnographic research on indigenous histories, beliefs could add value to school projects, and make them relevant for learners. Dr. Bashaga's students learnt some ethnographic facts through their Art research and practical work. The students rediscovered the role of names in indigenous cultures (a reference to Southern Africa). The students learned that in indigenous contexts, names or reference to individuals may change as societal and family roles shift, and that there are distinct and direct references to describe family relations. For example, once a woman or a man marries, she/he is commonly referred to by (her in-law family) as "wife of . . . or husband of" . . . The speaker would illustrate ties to the in-law by qualifying this married person as 'wife of my brother, or husband of my aunt or of my cousin'. In culture abiding families, it is considered disrespectful and a sign of non-acceptance of the in-law relatives if their given/first names are used. Furthermore, as soon as the married couple has a child, reference or naming shifts again, to mark their position as parents. They will now be named "mother and/or father of."

Building these "complex kinships" has ethnographic value in the indigenous cultures where it is practiced. Tracing the narrative of upholding and cherishing expanded family ties, the authors reinforced the importance of the practice in keeping the "clan" closely knit and ensuring mutual support by all members. For instance, there are indigenous cultural structures which make it perfectly normal for someone to have more than one mother. In Botswana for example, children from two cousins will be considered as siblings, a practice that extends the brotherly/sisterly relationship further into new generations at points where it would become blurred. This social arrangement keeps a clan connected over generations contributing to united societies, nurturing grounds for members of the community to exist as "children from one womb" expressed in a conversation by Indigenous Leader, Motsiele (2007) with Khudu-Petersen. Advantages of nurturing extended family were highlighted by Beugré and Offodile (2001) citing other authors stating that:

The extended family also has positive impact on individuals, perhaps more so. It often provides social support in difficult situations such as death in a family, sickness or job loss (Beugré 1998). 'There is a general inclination of people in traditional societies to rely on members of their in-group for emotional as well as socioeconomic support and to feel some distrust for members belonging to an out-group' (Ali and Al-Shakis 1985: 664). Loyalty to family members is key to social acceptance as is also the importance of the group. In a collectivist culture, one assures one's social integration by being loyal to one's group, family or friends. (p. 538)

Readers in indigenous contexts may be aware that unlike in the Western situation, in many indigenous communities there are much longer strings connecting people beyond the nuclear family. It is believed in many African societies that "It takes the

whole village to raise a child” (Knight and Trowler (1999); Palmer and Gasman 2008; Swadener 2000). The art education exercise described above helped learners to examine their own identities and social connections. The extended family described Dr. Bashaga’s example, may be the root of the indigenous philosophy in which education of children is a shared responsibility. In the analysis of colonizing factors, and seeking pathways toward democratized and transformed education for indigenous learners, this chapter draws attention to the phenomenon of loss of relevance in regard to the reference of Africans to their relatives and the naming of their children.

The students in Dr. Bashaga’s class had other eye-opening discoveries in regard to traditional names given to children. They found out that having been born into a family, living in the society, and experiencing positive and negative events affecting the people and their land, many people name their children according to these experiences. Indigenous names are given to children to commemorate sad events that happened to families around their time of birth. If there is famine, a child can be called “Tlala” which translates to “hunger.” The ugliest names were given to children born after one or more siblings had passed away at baby age. There are names like “Matlakala” – Trash, or Maswe – Ugly face. A practice which elders explain to be protection of its bearer because the Gods would not want to call someone who has such an ugly name.

These negative names have often been frowned upon and forbidden by colonial Christian pastors and teachers and were instead replaced with names expressing opposite feelings or Biblical names. Of course, there are also indigenous names marking positive events or phenomenon such as Mmapula (girl of the rain), Kgomotso (comfort after grief), Bonte (beauty), and Khumo (wealth). European names have also been given to replace names that are considered difficult to pronounce, e.g., Kgomotsego (accepting loss and overcoming grief) and Rikeletso (wishes). In one case a girl was named “Chelwana,” which in Shekgalagari means little seed. The name describes the fact that she was born tiny, in a family that had fertility worries. Her name marked the fact that she may have been tiny at birth, but she will grow to blossom and carry on the family/clan’s bloodline. Sadly, when she entered school, her name was changed to Boingotlo (Setswana) meaning obedience. Ashamed of her given name, she would not let anyone call her Chelwana any longer. The knowledge and hope vested in the naming of this girl was forever lost. This phenomenon has been observed and by a number of researchers including, Suzman (1994), Guma (2001), Lesejane (2006), and Neethling (2005).

This so-called civilization disparaged and even outlawed a lot of African values and practices. These oppressive structures negatively affected Africans, in their sense of trust and respect for indigenous epistemologies, and their sense of identity and pride in their own cultures have been diminished. During her PhD, Khudu-Petersen (2007) observed a curriculum unit in which a teacher (Ms. S) accepted the idea of working with indigenous knowledge bearers. She visited the village to find someone she could collaborate with in teaching hand-molding with clay. She was pointed in the direction of one of the village elders (Mrs K). Mrs. K. agreed to get involved in classroom teaching. The two women held a preparatory meeting in

which Mrs. K told the teacher a story, which could possibly be narrated to the children. The teacher asked if it would be alright for the children to be challenged to finish up the story themselves. The storyteller was excited by this idea, which fell fully in traditional storytelling culture where the audience, particularly children, are given a chance to predict the actions of the protagonist before the storyteller goes on to narrate further.

During the storytelling session, the learners were relaxed and free to participate. The usual frontal desk arrangement was exchanged for a circular arrangement and the rigid “only teachers are allowed to talk” rules were overruled. The story was dramatized and illustrated and, according to the teacher, the pictures were more vivid than usual. The story told was highly entertaining, it included songs and rhymes which the children were happy to sing and chant. Dramatization came easy and without any shyness.

The story was of a hunter who during the drought season went out into the bush to find food for his family. A beautiful bird sang a melodious tune as it guided him toward a cave which had big shiny eggs. The bird told the hunter that he was allowed to take only one egg. Therefore, he thought he must choose the biggest of all. The man kept on picking an egg, laying it down only to pick another egg which he thought to be bigger; all the while he murmured a chant that matched his confusion. His friend, the bird tried to warn him as the giant who owned the cave was approaching. The class was tense with suspense! The furious monster arrived at the entrance of his cave. The storyteller paused and looked at the children who expected her to carry on. However, the storyteller asked the teacher to take over. Ms. S. asked the children to go into groups to find how the story could have ended. There was a lot of pushing and bustling around the classroom with some children already blurting out how they thought the story would end. Some children already knew the full story. The children eventually settled down in groups and presented the following possible ending of the story:

1. The giant was mad at the man; he took him, tore him to pieces, and devoured him.
2. The man shivered with fright, he knelt down to beg the giant to save his life. He explained that he had to find food for his starving children. The giant forgave him and let him go.
3. The monster forgave the apologetic man and gave him an egg to take home.
4. The friendly bird asked the giant to pardon his friend, which he did and even gave him an egg to take home.

The learners were eager to hear the “true” end of the story but the facilitator told them that she would postpone the answer to another time when she would tell the same story by the fire. When the children still insisted that they be told how the story really ended, the storyteller gave an answer that was eye-opening toward the nature of indigenous knowledge, which was to say: “You took the story to so many different endings and they were all suitable and therefore they are correct. Even when people embark on the same journey, they may arrive at different destinations!” When the teacher later asked the elderly woman why she did not tell the story as she originally

knows it, she was told that traditional stories are like cookery; every woman has her secret recipe – a little more or less salt makes the food special.

When asked for the moral of the story, there were quite a few interpretations. Some children said the story was a lesson about decision-making. Other children thought the most important message was that one should not take anything without asking the owner. Another message was that one should stay cautious and heed warnings. A few children also said the story was a lesson for people not to be greedy but to appreciate any little bit that they are offered. Education practitioners reading this chapter may realize how the involvement of indigenous facilitators cover a wide-range of topics and turn the pedagogic approach from the compartmentalized style to an interdisciplinary approach. In the storytelling session cited above, there were elements of language learning (listening, comprehension, and self-expression), there were critical thinking and problem-solving, moral education, and art. The children also learned something about the open nature of traditional oral literature.

Up to now, the authors have only cited positive effects of teacher/cultural collaboration. However, there are occasions where such collaborative efforts can fail. One such an occasion was observed by Khudu-Petersen (2007) when the teacher and his facilitator did not meet beforehand to prepare for the class session. The indigenous facilitator was a basket weaver, who had promised to bring samples of materials and some tools to demonstrate the craft to learners. Even though the facilitator appeared on time for class, he hardly had any tools or materials to show. He was slightly drunk and he smelled of snuff. The gentleman asked the teacher for money before he could start teaching. He said a few things in the local language, but the teacher did not understand. The basketry lesson failed to happen. The teacher was disappointed and quite upset. Of course, prejudices were confirmed: “The San do not care for the education of their children . . . they do not know the value of education.” This particular teacher even said he would never invite “them” (referring to community members) into his classroom.

It is situations like the one described above that cause misunderstanding and propagate prejudice and the marginalization of indigenous people. Instead of quick judgments, the education practitioner is challenged to consider that not every member in an indigenous community is willing or even suitable to volunteer services and share skills in a formal set-up. Another reality to face is that alcohol abuse is rampant in indigenous communities (in Botswana) as proclaimed by Molamu and MacDonald (1996); Twyman (2001); Le Roux (2002). Exploring the reasons for alcohol abuse among indigenous people of the Kalahari may need to be further explored, but that process lies beyond the scope of this chapter.

These are some of the challenges that call upon researchers and teachers to explore the causes of issues negatively affecting indigenous peoples’ lives. The research undertakings may provide answers on which to base recommendation for policies that are favorable to indigenous peoples. Even though the indigenous people of Botswana usually reside in remote places, where there is high level of unemployment and poverty, many tend to conform and cooperate with public service providers. The community members often have the spirit of volunteerism and are proud to have a hand in the education of their children.

The authors of this chapter pose a further question to readers: Why should indigenous peoples be “invited” and expected to facilitate lessons and share their knowledge free of charge while public servants and researchers are paid for their work and their skills? This expectation of volunteerism from indigenous people who are often financially underprivileged can be interpreted as indicative of the little value that is awarded to indigenous knowledge and the bearers of it. The ruling elite and the dominant ethnic groups enjoy economic power at the expense of the minority ethnic groups who reside in remote areas. To better understand the circumstance surrounding some of the problems experienced in schools, education practitioners are called to consider these socioeconomic and political issues when working with indigenous communities.

If sustainable transformation in education is to be achieved collaboration between school and indigenous communities is imperative. However, there should be a paradigm shift toward a system which would truly accept and value indigenous people and their knowledge. Through researching and re-researching educational processes, any form of colonization in education should be resisted, whether coming directly as Western imperialism or locally based ethnic dominance and marginalization of indigenous peoples. To gain insight into issues affecting indigenous peoples, storytelling was found to be an important tool to diagnose symptoms of the colonization such as disregard or distortion of names of indigenous locations, often eradicating valuable historical meanings that connect indigenous people to their homeland. When original names are erased, it becomes easy for indigenous people to be denied ownership of the land. An example is the narrative of the origin of the name Leuzwe/Luuzwe which is a Bakgalagari village, retold by Chilisa et al. (2017). According to a sage, there was a group of Bakgalagari people who had settled in dry land and were desperate to find a water source for domestic use and to water their livestock. Besides lack of water, the people had to guard their animals against predators. The duty of guarding livestock included studying the direction of predators, through observation, as many people can tell paw prints of each of the troublesome animals. The community members also studied the direction and times these animals moved. The people of Luuzwe were troubled by a hyena which came at night to steal animals from their stalls. Every morning men would trace the spoor of the hyena, in order to follow it and kill it. The people soon noticed that the animal's prints were obviously wet as it passed by their kraals. The men of Luuzwe found this discovery important because it indicated a possible water source located at the direction from which the hyena came. When the people traced back the animal, they arrived at a salt pan which had natural water holes.

A man was sent down the water hole to taste the water to check whether it was too salty or safe to drink. The explorer went down the well, tasted the water, and passed the gourd back to his people and called out “*Tshola leuzwe!*” Which translates to: take and taste it yourselves. The water turned out to be good to drink. Therefore the community moved from their settlement which had little water, to settle in the place where they had discovered water. They then named their village: Leuzwe or Luuzwe!. The name of this village has now been distorted and turned into Dutlwe, a meaningless name with no evidence of the historical identity it originally had.

In the African context, the names of places and people have important historical and/or cultural backgrounds and practitioners should engage in research to explore their meanings. In order to mitigate against hegemony and shift power relations, giving indigenous people a voice in matters concerning their identity and issues relating to their environment, educators are urged to avoid taking situations, practices, and facts for granted, but rather to engage in research; asking their learners and communities members for stories behind cultural issues, which could include taboos, totems, decorative patterns, architecture, music, and dance.

Community/school collaboration may be one of the ways to give teachers the opportunity to begin to understand their learners, gain insight into methodologies that are relevant for them, and acquire culture relevant examples to use in the classroom. The elders could feel accepted, respected, and recognized and may, as a result, take ownership of education and encourage their children to not only accept school but feel “at home” in the school environment. Collaboration can benefit both parties and strengthen relationships, nurturing ontological security. Following the argument of Khudu-Petersen (2007), teachers who are mostly from the dominant ethnic backgrounds may experience loss of what Giddens (1984, 1990, 1991) called ontology security as they do not feel they “fit” in an “alien” environment where they are not acknowledged by the indigenous communities. Equally indigenous learners, parents and elders in the local communities may have lost ontological security due to feeling alienated in the school environment where the language spoken, the culture, and even the learning environment are different from their own. The discomfort experienced by all stakeholders can be ascribed to loss of ontological security, or the trust people have in their surroundings, both human and nonhuman. This sense of security can only be achieved through mutual recognition and respect. To gain respect, it is necessary for stakeholders to collaborate so that they become familiar with one another, acknowledge the humanness of the other and experience the strengths of each other.

Exploring the possible advantages of collaborative work, Khudu-Petersen (2007) conducted a study in which she initiated collaboration between indigenous knowledge bearers and teachers in order to ease the tension between school and community as well as teachers and learners in Kweneng West district (inhabited by BaKgalari and San people) where a strong culture of underperformance in external examinations such as the Standard Four Attainment Tests and the Primary School Leaving Examination. Researchers have bemoaned the ethnic marginalization in education of learners in the district (Jotia and Pansiri 2013; Mokibelo (2016).

Khudu-Petersen’s study lasted 1 year and participants were two-hundred-and-forty (240) 4th year primary school learners. The study used pre- and post-intervention data collection of evaluation of learners’ self-esteem, level of trust in their community members, and acceptance and respect for their culture. Before the involvement of community members in facilitation, the research used binary questionnaires, interviews, and observations to find out how children valued, trusted, admired their family members as well as finding out how they felt about themselves. One of the data collection exercises was asking children to look in the mirror and describe their faces; free room was given by stepping back, observing without taking any photographs and but, with the consent of the children, voice recording.

The study revealed in the preintervention stage that children generally thought negative of themselves, their families, and their communities. They mostly made negative remarks about their own looks and the looks of their peers prior to the intervention. An intervention was then implemented in which members of the indigenous community were engaged in facilitating in Arts and culture in Creative and Performing Arts (CAPA) lessons and other curriculum disciplines. Storytelling, singing, dancing, and crafting were used to support the formal teaching method and to provide content relevant to learners.

The results of the collaborative cultural intervention revealed that most of the children found themselves beautiful and they expressed their feeling of respect and admiration for their elders. In contrast to the negative responses in the pre-intervention stage, after the intervention, the children responded positively to the statements: “I find myself good looking” and “The people in my home are knowledgeable” and “I admire my family members.” The San children (indigenous people of the Kalahari), who have distinctively different features as compared to the Tswana ethnic groups and have languages that sound exotic to the “Other,” seemed to have benefited most from the intervention. Most of children in this group found themselves beautiful and trustworthy, and they expressed admiration and trust toward their families and the village communities.

Summary

This chapter has described indigenous-based epistemologies, with a focus on Africology, and has articulated their relevance for decolonization and transformative education of indigenous peoples. The negative effects of colonization on indigenous populations were uncovered. The chapter discussed the harmful effects of internalized colonialism, which perpetuates oppressive structures even in the postimperial era. This discussion was important as a means to incite reflexivity in readers to help identify practices which may thwart efforts toward decolonization and transformation of education. Therefore, the readers were urged and guided to research in every discipline and in all topics in their school and tertiary institution curriculum for indigenous identities, indigenous languages, symbols of local environment, and unique cultural practices.

The authors mainly used examples in form of curriculum activities which implemented methodologies based on Afroecology. The chapter aimed to guide education practitioners toward decolonizing and transforming education through interrogation of their own praxis, comparing the conditions and circumstances described in the chapter with situations prevailing in the communities where they work. By offering examples of how indigenous knowledge, research frames and teaching methods could be applied for researching educational praxis, it is hoped that the chapter could contribute toward transformation of education to make it inclusive for all learners. Alongside suggestions to transform education, the authors strived to make readers aware of the resistance and hindrances that they may face when engaging in “new”

teaching methods which could shake up power relations in educational practices where indigenous philosophies and knowledge are undermined.

Conclusion can be drawn that Afrology, which recognizes values and wisdom of indigenous peoples and respects their ways of learning, is a key philosophy in pushing education decolonization and transformation agenda.

Abstract

This chapter examines the relationship between Guy Debord’s notion of spectacle and settler colonialism, exploring the role that spectacle plays in the solidification of the settler state and the consolidation of whiteness. In so doing, it examines contemporary depictions of Native peoples in the mainstream media, with a particular focus on coverage of Indigenous peoples at Standing Rock and the #NoDAPL prayer camps. Ultimately, I argue that the ongoing production of spectacularized “Indians” functions to erase the lived experience of Indigenous peoples and, in so doing, serves as a transit for settler colonial relations.

Keywords

Spectacle · Settler Colonialism · Neoliberalism · Whiteness

#NoDAPL anti-colonial struggle is profoundly anti-capitalist. It is the Frontline. It is the future (Estes 2016)

I used to tell people when I was young who asked, ‘what do you Indians want?’ ‘the right to be left alone to live’ . . . now I don’t see that as an option. Now we must do our best to live and show the rest of the world how to live. (Ladonna Brave Bull 2016)

Water Is Life

This simple but profound refrain became the rallying cry for the #NoDAPL movement (At its height, #NoDAPL was a global movement, drawing Indigenous peoples and allies from across the world; from New Zealand, Canada Australia, Ecuador, Peru, Hawaii, Mexico, and Belize among other nations.). The Lakota peoples and their allies gathered along the Mni Sose (Missouri River) and on the lands of the Oceti Sakowin (The Great Sioux Nation) to defend water and life. Led by Native youth and women, water protectors put their bodies on the frontlines of a 241-year war (and counting) against the ever-encroaching settler state. In this most recent battle, the objective was to block the Dakota Access Pipeline (re)routed by the Energy Transfer corporation to pass under Lake Oahe (the tribes water source) and across the Treaty lands and burial grounds of the Lakota peoples. Indigenous struggles to defend water, land and other relations operate well beyond the left-right continuum of American politics. It’s always been “Indians” vs. settler; regardless of political party (Consider, for example, that under President Obama – often viewed as the #NoDAPL savior – US oil production grew to reach 9.4 million bpd in 2015; the largest domestic oil production increase during any presidency in US history.). This is why the colonialist project is about elimination. Not assimilation. Not incorporation. Not accommodation. It is also why, for Indigenous peoples, the struggle is not grounded in claims for recognition or reconciliation. It is about refusal. Refusal equals life.

Introduction

This chapter examines the relationship between spectacle (Among the various theorizations of spectacle (e.g., Barthes, Crary, McLuhan), this chapter draws heavily upon the work of Foucault and Debord. Specifically, Foucault’s understanding of spectacle in terms of surveillance and Debord’s notion of spectacle as ideological, more broadly linked to capitalism, market consciousness, and a “society of the spectacle” figure prominently.) and settler colonialism. I am particularly interested in the role that spectacle plays in the solidification of the settler state and the consolidation of whiteness, particularly as intensified under neoliberalism. Moreover, while the implications of settler colonialism for Native peoples are or, should be, self-evident, I also consider the implications for the nonindigenous settler subject. As Memmi posits, “the benevolent colonizer (To be clear, Memmi’s notion of the “benevolent colonizer” is a referent to the self-effacing colonizer who refuses the ideology of colonialism but still lives within its confines (Memmi, p. 64). In contemporary parlance, they might be considered white allies.) can never attain the good, for his only choice is not between good and evil, but between evil and uneasiness” (Crary 1989, p. 87). Throughout this chapter, the spectacular portrayal of Indigenous peoples generally and of the #NoDAPL prayer camps more specifically, serves as a site in which to explore the contours of this “uneasiness.”

Writing in the late 1960s, French theorist Guy Debord penned his cautionary text the *Society of the Spectacle* (1967), wherein he laments the displacement of “authentic” social relations with their false representations under advanced capitalism. He writes, “In societies dominated by modern conditions of production, life is presented as an immense accumulation of spectacles. Everything that was directly lived has receded into representation” (#1). Bracketing his modernist discourse, the deeper salience of Debord’s analysis is its marking of the move from life in a market *economy* to life in a market *society* and the shifts that engender the “degradation of being into having” and from having to appearing (#17). He writes:

... (Spectacle) is not a mere decoration added to the real world. It is the very heart of this real society’s unreality. In all of its particular manifestations – news, propaganda, advertising, entertainment – the spectacle represents the dominant model of life. . . In both form and content (it) serves as a total justification of the conditions and goals of the existing system (#6).

Considering that his treatise was written well before the digital age and hyperreality of the twenty-first century, the corpus of Debord’s argument remains remarkably prescient. Under neoliberalism, the speed, scope, and power of spectacle has only intensified, reconfiguring the very character of life as not only conditioned by consumerism and commercialization but largely replaced by, exchanged for, and even rejected in favor of its more spectacular simulations. Think, for example, of the blurring lines between “real” and fake news and “real” and digital lives. Under spectacle-capitalism virtually every institution, every mode of being has been commodified to the point where it isn’t only that *everything* is for sale but that life itself is monetized and only worth living if it is on display (Consider for example the ways in which sex (e.g., Grinder, Tinder), love, and intimacy (e.g., eHarmony, cuddle businesses) and even marriage (e.g., Married at First Sight, the Bachelor) have not only been commodified but also put on display.). As Gamson (Gamson 2011) observes, we have moved beyond the notion that “everyone gets fifteen minutes of fame” into a time when “everyone already is a star” (p. 1068). Consider, for example, the rapid proliferation of social media celebrities (Consider, for example, the phenomena of the YouTube celebrity with personalities such as PewDiePie amassing 54.1 million “followers” and a net worth of \$15 million for being a “foul mouthed” video-game commentator. Such “celebrities” are beginning to surpass the wealth and popularity of “traditional” Hollywood stars. See, for example, <https://www.theguardian.com/technology/2016/feb/03/why-youtube-stars-popular-zoella>) who generate large fandoms, millions of followers and dollars, from simply “sharing” curated and staged slices of their lives.

While life in the infinite public raises a variety of important questions about what it means to be human, my central concern remains with how the culture industry (re) produces exhibitions of self and other that works to consolidate whiteness and secure settler futurity (I understand the motif of “futurity” – with an intellectual genealogy that traces back to John L. O’Sullivan’s, treatise on manifest destiny – as an exclusively settler construct that is incommensurable with Indigeneity.). That is, insofar as spectacle is contingent upon the radical reification of self, an overvaluing

of the present, and rupturing of relationality, it becomes the perfect theater for producing anchorless (neoliberal) subjects whose every desire is increasingly structured by capital. As it forecloses relationality by normalizing disconnection, it effects an erasure of Indigenous peoples who continue to define themselves through relationship – to land, to history, to ancestors, to all our relations.

Consider, for example, how the water protectors at Standing Rock were only rendered visible through spectacle (According to Fairness and Accuracy in Media (FAIR), by September of 2016, of the three major broadcast news networks, only CBS filed a story on Standing Rock. Moreover, that story aired at 4 a.m. and was actually a re-reporting of a 48-word NPR story. FAIR also noted that while NPR's original version featured Amy Goodman's footage of the unprovoked attack on the protectors, CBS chose to exclude it.). That is, until and outside of the widely-circulated images of armored vehicles, riot police, water cannons, war bonnets, teepees and painted ponies, the Lakota peoples hardly existed, virtually erased from public consciousness (It should be noted that the few articles published in the press on this history were written by Native American scholars. For example, see: Nick Estes, "Fighting for Our Lives: #NoDAPL in Historical Context" (The Red Nation 2016) and Julian Brave NoiseCat and Anne Spice, "A History and Future of Resistance" (Jacobin Magazine 2016). Also, while independent media (e.g., Unicorn Riot, Anti-Media, AJ+) provided coverage, they also deployed spectacle as a means of drawing attention. As reported by Anti-Media, "Where the mainstream media failed, the independent media relentlessly covered the protests." Livestream coverage of the spectacular attacks was indeed *relentlessly* posted, often creating confusion about the level of violence at the camps. The nonspectacular reality was that the overwhelming majority of time at the Oceti Sakowin encampment was spent in prayer, cooking, training, eating, laughing, building, teaching, working, washing, cleaning, singing, listening, reading, and tending.). That is, except when needed as stand-ins for the "shame" of America. The reality, however, is that Standing Rock, from the Ghost Dances (1800s) to the occupation of Wounded Knee (1973), has long served as a site of collective, anti-colonialist, anti-capitalist Indigenous resistance and, that time and again, the *Oceti Sakowin* have stood on the front lines, protecting against the forces of US imperialism. Lost to the compressed space of spectacular time is the architecture of settler violence – Red Cloud's War (1866–1868); the War for the Black Hills (1876); the Indian Appropriations Act (1877); Wounded Knee (1890); the Dawes Allotment Act (1887); the Flood Control Act (1944); the Indian Relocation Act (1956) – and the multi-layered history that provides the context for what should have been the one and only #NoDAPL headline – "Unceasing Settler Violence Masquerading as Democracy Continues to Dispossess Native peoples."

Context and Definitions

In an effort to underscore the significance of historical context as an effective fetter against spectacularization, I include in this section, a definition of terms. More specifically, one of the consequences of living in a society where spectacle "inverts

the real” is the loss of coherent narratives and an ability to distinguish between what is “real” and what is simulacra (Baudrillard 1994). This postmodern condition has only been exacerbated by the 24/7 cycle of digital and social media. Danish scholars Vincent Hendricks (Hendricks also coined the term “post-factual democracy” (Hendricks 2013).) and Pelle Hansen (2014) argue that while knowledge production has always been shaped by the social sphere, the “infostorm” wrought by modern technologies has significantly “amplified” the distortion of truth, “making us more vulnerable to err than ever and on a much larger scale” (First posted on December 18, 2013 in “The Conversation” <http://theconversation.com/all-those-likes-and-upvotes-are-bad-news-for-democracy-21547> and then later in his book *Infostorms* (Hendricks and Hansen 2014, p. 2).).

Insofar as the “infostorm” also ushered in a decline in fact-based news reporting, the proliferation of corporate funded “research,” and the overall googlization of society, it stands to reason that a return to “facts” and scholarly research is in order. As such, in the interest of clarity and with recognition of the importance of context, history, and intellectual genealogy, I provide definitions for the following key words as they appear in this text: Native American, American Indian, Indigenous; Settler/Settler Colonialism; Neoliberalism; Whiteness; and, spectacle/spectacular.

Native American, American Indian, and Indigenous Peoples

The terms Native American and Indigenous peoples are used almost interchangeably to refer to all those who “exercised powers of self-governance prior to colonization by and, incorporation into, the modern nation state” (Grande and Nichols 2014). Use of the term “American Indian” is generally reserved for specific references to the current 566 “federally recognized” tribes in the United States (In the United States, tribal sovereignty is the inherent authority of Indigenous nations to govern themselves. As “domestic dependent nations” the United States is also obligated to provide federally recognized tribes necessary services, including the provision of education and health care. Beyond issues of law and treaty rights, there are other forms of sovereignty that Native peoples exercise and demand, which are inextricably connected to each other. For example, in her work on Papua New Guinea, Paige West 2010, 2012 accounts for how the loss of sovereignty over land and biodiversity is connected to the loss of representational sovereignty. See, for example, the work of Scott Lyons (2000) on rhetorical sovereignty and Michelle Raheja (2011) and Mishuana Goeman (2013) on semiotic and representational sovereignty.). In theory, federal recognition grants American Indians political sovereignty (Native American sovereignty – the right of tribes to make their own laws and be governed by them – predates the formation of the United State and is still recognized through treaties that were negotiated on a “government to government” basis.) as well as other treaty rights through their government-to-government relationship with the United States. Thus, unlike other marginalized groups (e.g., African Americans, women, immigrants, LGBTQ), the axis of oppression for American Indians shifts from one of “racist exclusion” to that of “forced incorporation” (Rifkin 2011, p. 342). This

distinction, in turn, gives rise to political projects organized around struggles for autonomy as opposed to demands for inclusion (i.e., enfranchisement, civil rights).

Settlers and Settler Colonialism

As argued by Rachel Flowers, it is important to refer to “non-Indigenous” peoples as “settlers” since it serves to denaturalize and politicize “the presence of non-Indigenous people on Indigenous lands” (Flowers 2015, p. 33). Drawing upon the seminal work of Patrick Wolfe (2006), I distinguish settler colonialism from other forms of colonialism as follows: (1) it is “first and foremost a territorial project” where land (as opposed to natural or human resources) is the precondition; (2) the priority is to eliminate and remove Indigenous peoples in order to expropriate their lands; and, (3) since “settlers come to stay,” strategies of elimination are not simply deployed at the time of invasion but rather serve as a structuring logic. Thus, as noted by Wolfe, settler colonialism is a structure and not an event” (2006, p. 388). Meaning, beyond the initial event of invasion, it “persists as a determinative feature of national territoriality and identity” (Rifkin 2013, p. 324).

Neoliberalism

Neoliberalism is an economic and political project that has unfolded over the past 25 years or so based on the theory that markets and competition, offer the most efficient and democratic means of improving society. In practice, however, neoliberal policies (e.g., deregulation, privatization) have contributed to the highest level of inequality and greatest concentration of wealth and power in the top 1% of the population since the Gilded Age (Bartels 2008). The concentration of economic wealth and political power under neoliberalism was recently confirmed in a study by Gilens and Page (2014), who after conducting a comprehensive analysis of national policy (1981–2002), found that in the United States, elites, and special interest groups drive policy over the will of the “general” people (read: non-elites). As a result, they have concluded that the United States is no longer a functioning democracy.

Whiteness

I use whiteness (as opposed to white supremacy or white privilege) in this chapter as a way to signal a connection to the discourses of whiteness as they emerged through critical race theory (CRT). Within the frameworks of CRT, whiteness is understood as a “socially significant structure that mitigates life chances in American society” (Guess 2006, p. 650). Founding CRT scholar Cheryl Harris (1993) argues that whiteness is best thought of as a form of property that carries material and symbolic privilege (e.g., job security, access to real estate, conceptions of beauty) that is conferred to whites, those passing as white, and “honorary” whites. Harris situates

the origins of “whiteness as property” in the systems of domination (i.e., slavery, colonialist dispossession) that created “racially contingent forms of property and property rights” (p. 1714). As such, she argues that whiteness is codified into law and, thus, remains a defining and enduring characteristic of American democracy.

Spectacle

In general terms, the notion of spectacle invokes images of excess and extravagance. As a construct developed by Debord, it builds upon Marx’s theories of alienation, commodity fetishism, and reification to describe the, “social relationship between people that is mediated by images” (4).

More critically, it is understood as a tool of pacification and depoliticization, “integrally connected to Debord’s formulation of separation” (Best and Kellner 1999, p. 133). That is, it is through the passive consumption of spectacles that one is “separated from actively producing one’s life” (133). Moreover, insofar as spectacle is related to “the business of selling novelty” it has an interest in annihilating historical knowledge, the central means by which novelty can be judged (Crary 1989, p. 106). Crary (2000) examines twenty-first century manifestations of spectacle, particularly as a mode of “contemporary” or non-coercive power. For Crary (and Baudrillard), the emergence of mass media blurs the boundaries between spectacle and spectator, the ubiquity of which begins to desensitize rather than evoke emotionality from the spectator.

The keywords are foundational to the grammar of US empire and as such help to inform and deepen our understanding of the structures and processes of settler colonialism. In the following section, I draw upon this base to explore the more particular relationship between spectacle and whiteness.

Spectacle and the Consolidation of Whiteness

Debord’s central thesis or provocation is that life in a “commodity-saturated, mass-mediated, image-dominated and corporate-constructed world” engenders an increasingly isolated, alienated, and passive citizenry that unwittingly relents to a groupthink of market consciousness disguised as individual agency (Kaplan 2012, p. 458). His analysis illuminates the inherent paradox of spectacle; despite (or because of) its intention to illicit emotion and (re)action, spectacle produces alienation and passivity. Particularly in a mass-mediated, hi-tech society, the sheer volume of content alone can produce a deadening effect. But spectacle is both dialectical and self-perpetuating. Meaning, the resulting (individual and social) ennui searches for relief from the deadening effect and, in so doing, activates the production of ever more spectacular imagery, generating an endless and alienating cycle of (simulated) life in search of the “real.” As the search intensifies, so does the desire for anything perceived as “authentic” – authenticity is the antidote (For early and consistently excellent discussions of the desire for “authentic” nature and culture see the work of Dean MacCannell 1976.).

It is this cycle – the positioning of spectacularity against “authenticity” and authenticity as the antidote to the (post)modernist condition – that compels this analysis, particularly in the wake of #NoDAPL. For as long as “Indians” have been situated as the (authentic) anti-modern subject, “Indian-ness” has perennially served as a favored foil (antidote) for whiteness. While many Indigenous studies scholars have examined the ways in which Native identity is appropriated in the service of white identity formation (e.g., Berkhofer 1987; Deloria 1969, 1998; Huhndorf 2001), my interest is cast more broadly. That is, beyond questions of white identity formation: How does the expressed desire for the imagined Indian serve the propertied interests of whiteness, which is to say settler statecraft? To explore this question, I begin with more mundane expressions of Indian-as-spectacle and move toward their deeper implications.

Currently, there are 20 reality shows in circulation that stage interventions (read: provide antidotes) for the normative hegemony of white-middle-class life by depicting life on the “frontier” or “the wild.” (Among the current shows are: *Survivor*, *Colonial House*, *Alaska Bush People*, *Frontier House*, and *Man vs. Wild*.) Through their ubiquity and popularity, such shows evidence the extent of settler-desire for the imperialist fantasy of “pre-modernist” times at the same time they appease settler supremacy. They refract what McLintock (McClintock and Robertson 1994) refers to as “panoptical time,” (More specifically, McLintock (1994) defines panoptical time as “the image of global history consumed – at a glance – in a single spectacle from the point of privileged invisibility” (p. 128).) a key component of imperialist discourse that situates progress as fundamentally contingent upon on a “shadow other,” which is, of course, the savage (Pardy 2010). Indeed, as noted by Rosaldo (1989) “In this ideologically constructed world of ongoing progressive change, putatively static savage societies become a stable reference point for defining. . .civilized identity” (p. 70). Native peoples are so much “a shadow” that with the exception of one show (*Frontier House*) they are not even present – literally eliminated from settler view. In this sense, progress is the central character, so critical to settler mythology that it drives a deep-seeded need to continually perform the fabled journey from savage to civilized over and over again; settler-subjects playing out fantasies of the colonial encounter as theater.

There was one reality show about Native peoples – *Escaping Alaska* – which, depicted five Alaska Native youth (identified as “Eskimos”) “secretly” plotting to leave their families and homeland in order to experience life in the lower 48. True to Debord’s thesis, the society of the spectacle can only produce grotesque caricatures. In this instance, Inuit youth are depicted as members of a virtual cult that apparently holds their members’ captive and in complete ignorance of the “outside” world. Baloy (2016) theorizes the oscillation between the complete erasure and hyperreality of Indigenous peoples in terms of “spectrality” (i.e., a state of haunting). She deploys the term “holographic Indigeneity” to describe the phenomena of Native peoples hyper-visibility “from some angles” and invisibility from others – always a constant presence even in moments of apparent absence (p. 209).

Lakota scholar Phil Deloria (1999) documents how the oscillation between settler desire and repulsion for Indian-ness has manifested through the long-standing practice

of “playing Indian.” Dating back at least as far as the Boston Tea Party (1773) when the “Sons of Liberty” staged their protest wearing headdresses and war paint, Deloria demonstrates how the spectacle of “playing Indian” has been a persistent feature of the search for “authentic” American identity. The advent of digital technology and social media has only enabled the speed and scope of this cultural spectacle, producing an abundant archive of Indians of the settler imagination. Baloy’s (Baloy 2016) research demonstrates that, indeed, the main source of people’s information on and experience with Indigeneity comes through media. Thus, from Victoria’s Secret models in full headdress to grotesque sports mascots and fans in red-face, settlers play out their “uneasiness” with the violence of the settler project in full, spectacular display.

In theorizing the space between spectacle, cultural politics and neoliberalism, Giroux (2009) draws upon the insights of British media theorist Nick Couldry (2008) who discerns, “every system of cruelty requires its own theatre” (p. 3). As noted by Couldry, while some forms of cruelty depend on secrecy, *systems of cruelty* require legitimation via public and “ritualized performance” (p. 3). Using settler colonialism as an illustrative example, his reasoning would go something like this:

- (a) Settler colonialism is a system of cruelty.
- (b) The “truths” of which are unacceptable to democratic society if stated openly.
- (c) Those truths must be “translated into ritual that enacts, as ‘play’, an acceptable version of the values and compulsions on which that cruelty depends” (p. 3).

Reality television is one example of the “theater of cruelty” wherein the rituals of everyday life under settler colonialism are “enacted as play” in order to “legitimate its norms, values, institutions, and social practices” (Giroux 2008, p. 224).

Though often dismissed as innocent fun, mediated performances that erase or perpetuate gross caricatures of Native peoples have *systemic* impact. Unfortunately, this impact is typically framed in psychological terms, playing out something like this: (1) Offending settlers are called out on their racism; (2) they attest to their good intentions and express desire to honor and respect the lifeways of Native peoples as well as regret for hurt feelings; (3) Native “victims” of said “honoring” (re)register their feelings of offense and outrage, often citing harm to their self-esteem and identity formation; and (4) Rinse. Repeat. While I ultimately urge moving beyond this psychologizing discourse, I want to be clear that research evidencing the latent, direct, and collateral damage of racial stereotyping is both chilling and definitive (see Pewewardy 1991, 2004; Fryberg and Markus 2004; Fryberg et al. 2008). The bullying, harassment, and discrimination that occur as a result of the regular and persistent misrepresentation of Native peoples are an affront to their dignity and to the democratic aspirations of the nation. That said, I argue that an exclusive focus on the psychological is deeply insufficient and perhaps complicit in maintaining imperialist relations and discourses.

The preoccupation with psychological trauma draws attention away from the material conditions of Indigenous peoples and violent strategies of the settler state (i.e., dispossession). The violence of this erasure is captured in Rosaldo’s (1989) notion of “imperialist nostalgia,” which links settler desire for an imagined past to a politics of death and mourning (p. 107). As Rosaldo (1993) writes:

... someone deliberately alters a form of life, and then regrets that things have not remained as they were prior to the intervention. . . people destroy their environment, and then they worship nature. In any of its versions, imperialist nostalgia uses a pose of 'innocent yearning' both to capture people's imaginations and to conceal its complicity with often brutal domination. (pp. 69–70)

As theorized by Baloy (2016), the dialectical relationship between spectacle and imperialist nostalgia provides the conceptual frame through which settlers imagine Native peoples. That is, as mediated, spectacularized versions of "the Indian" dominate the collective consciousness of settler society, it functions to erase the lived experience of Indigenous peoples: hypervisibility = invisibility. In other words, spectacle facilitates "imperialist nostalgia" and the passive consumption of Indigenous performance at the expense of *actual* Indigenous voices and histories.

In terms of Standing Rock, Baloy's work also helps explain the relative invisibility of the Sioux peoples and Indigenous water protectors as well as the hypervisibility of the more spectacular "#NoDAPL warrior." Indeed, from the beginning of the encampment (April 1, 2016) to the moment that the Army Corps of Engineers announced the (temporary) denial of the easement, mainstream media as a whole, essentially covered three (spectacular) events: (1) the police use of water cannons on protectors in subfreezing temperatures (November 21, 2016); (2) the arrival of thousands of veterans (December 2, 2016); and, (3) the "victory" celebrations following the Army Corps of Engineers announcement (December 4, 2016). While spectacle clearly drew their attention, FAIR reports that more often than not, the coverage was "limited, biased, and/or inaccurate" (For example, FAIR condemned the New York Times headline that read, "16 Arrested at North Dakota Pipeline Protest as Tensions Continue," noting that there had been more than 470 arrests. They also called out the framing of events as a "clash" between protesters and police by NPR, CBS, and ABC writing: "This 'clash' framing – also utilized in headlines on CBS (11/20/16) and CNN (11/20/16) – implies a parity between police in military vehicles, employing water cannons, tear gas, pepper spray, rubber-coated bullets, and concussion grenades (one of which may have cost an activist her arm), on the one hand, and basically unarmed civilians on the other (Police say one officer was hit in the head by a thrown rock).") And finally, FAIR took issue with the Washington Post headline (11/21/16) framing the attack from a police perspective: "Police Defend Use of Water Cannons on Dakota Access Protesters in Freezing Weather") Water protectors were consistently misrepresented as protestors (not protectors), agitators, and trespassers engaged in a "clash" with Morton County officials and Energy Transfer Partners; such false equivalences between unarmed peaceful protectors and heavily armed officers and their billionaire corporate backers can only be drawn through erasures of history and power. The gestalt of such coverage serves to perpetuate the myths of the settler project: the vanishing Indian, the benevolent colonizer, justified conquest, and the liberal (settler) state as the epitome of progress.

Spectacle and the Solidification of the Settler State

While Indigenous peoples have long lived the material realities of US imperialism, settlers are only recently beginning to contemplate the impact of authoritarian rule and capitalist accumulation. In the last 5 years alone, there has been an explosion of activism in the United States and across the world. Movements such as #Occupy Wall Street, #BlackLivesMatter, #NoDAPL, and more recently #Antifa have not only brought important issues to light but also changed public discourse. Phrases such as, “We are the 99%,” “I can’t breathe,” and “water is life” have been burned into the collective consciousness of the nation in a way that suggests there is no turning back. The academy followed trend, publishing important research that provided an evidentiary basis for the commonsense claims of activists.

Among the more effective scholarly interventions is the work of French economist Thomas Piketty and author of, *Capital in the Twenty-First Century* (Piketty 2014). In his almost 700-page tome, Piketty examines an impressive array of data to draw inferences about the evolution of inequality and growing concentration of wealth. His main finding is that while inequality is an inherent feature of capitalism (because inherited wealth will always grow faster than earned wealth), it can be effectively mitigated through state intervention. Absent such intervention, however, he predicts that inequality will continue to rise, putting the democratic order at risk. Though Piketty’s work has been met with a fair amount of critique, a recent study by the Stanford Center on Poverty and Inequality (2016) supports his findings, drawing a close relationship between federal economic policy and equitable wealth distribution (For example, the report shows that among Anglophone countries (i.e., the United Kingdom, Canada, Australia, Germany), the United States has the highest rate of inequality.). Considered alongside the Gilens and Page (2014) report that draws a statistically significant relationship between wealth and political power, such findings are foreboding. Indeed, the recent declaration by the Electoral Integrity Project (EIP) that the state of North Carolina is no longer a democracy (According to the report, the state’s overall electoral integrity resembled those in authoritarian states and “pseudo-democracies” such as Cuba, Indonesia, and Sierra Leone.) provides a window to the new age of oligarchy emerging from the structures and policies of neoliberalization enacted over the past 30 years.

Despite the growing public awareness, economist Paul Krugman observes that the average citizen cannot comprehend the depth of the inequality, which is to say the actual distance between the lived experience of the “average citizen” and the ultra-wealthy. I argue that this is due, in part, to the highly mediated and spectacular display of wealth. For example, while it seems as though we have constant and ready access to the “real” lives of the Kardashians or the “Rich Kids of Beverly Hills,” what we actually see is the spectacle of wealth – the lavish parties, ostentatious homes, and exotic vacations – not the lived experience. Their outrageous wealth is both mitigated and normalized through the familiar tropes of social life – family drama, sibling rivalry, romance gone bad, and struggles with addiction. The over-riding but subliminal plotline is that, underneath it all we are the same. Lost to the

veil of spectacle is the understanding that extreme wealth is contingent upon extreme poverty; hidden from view are all the forms of labor and extraction that enable the cruel disparity.

Within this context, it is not surprising that the rise of Trump (As reality TV star turned President, Trump epitomizes Debord's connection between commodity-spectacle and celebrity. He writes, "Media stars are spectacular representations of living human beings, distilling the essence of the spectacle's banality into images of possible roles...government power assumes the personified form of the pseudostar...a star of consumption gets elected as a pseudo-power over the lived" (60).) has also emerged in and through spectacular theater. Of particular note is his penchant for post-election rallies: 18 and counting. While it is not at all unusual for a sitting president to hold such rallies, the general purpose is to "create a new sense of shared national unity, rather than to show a divided country" (As stated by presidential historian Robert Dallek in the Washington Post article, "The Election is Over but the Trump Rallies Continue," https://www.washingtonpost.com/politics/the-election-is-over-but-the-trump-rallies-continue-the-president-elects-fans-turn-out-for-him-in-ohio/2016/12/01/00e25946-b7dd-11e6-959c-172c82123976_story.html?utm_term=.1548a75ad0ea). As examined by public policy expert Robert Reich, Trump's rallies deviate from this norm in the following ways: (1) they are only held them in states where Trump won; (2) rather than deliver a call for unity, their purpose is more to wind up the base and rally "the movement"; (3) rather than "shift from campaigning to governing," they mimic his pre-election rallies; and, (4) rather than use them as a forum to "forgive those who criticized him during the campaign, he employed them to settle scores" (Reich 2016) (See, "Why President Trump Will Continue to Hold Rallies," <http://robertreich.org/post/154643782110>). While such theatrics may indeed lather his base, the spectacle whiteness obfuscates its material realities.

It is precisely because Trump shares little else with his base, that the presentation of his own whiteness has to be so spectacular. It is the theatrics that obfuscate the chasm of inequality that stretches between him and the "average" settler. He is a multi-billionaire who inherited much of his fortune, attended elite, private schools, and never had to work a day in his life. His support for DAPL wrapped in a discourse about jobs, the "American" economy and the "good" people of North Dakota is a thin shroud over his real commitments: oil and profit. The oil dominance of his cabinet – Rex Tillerson, CEO of Exxon/Mobil as secretary of State; Rick Perry, former governor of oil-rich Texas as head of the Department of Energy – and his own holdings in DAPL pipeline builders, Energy Transfer Partners, reveal his actual "base." The drama of the spectacle is necessary to draw attention away from the economic abyss that is the \$20,789 per capita income of households in Bismarck, North Dakota, and Trumps reported \$3.5 billion net worth.

The intensification of cruelty under neoliberalism has brought with it a renewed press to draw the liberal subject (i.e., "benevolent colonizer") into its theater, raising the bar for even more spectacular productions of American exceptionalism, which is to say settler supremacy. As observed by Giroux (2008), "What is often ignored by many theorists who analyze the rise of neoliberalism is that it isn't only a system of economic

power relations, but also a political project of governing and persuasion intent on producing new forms of subjectivity and particular modes of conduct” (p. 224). Indeed, the construction of the settler state has, at every stage, relied on identity and cultural politics for its reconsolidation, requiring and soliciting certain ways of being, desiring, and knowing at the same time it destroys others (Agathangelou 2008; Duggan 2012). Productions in its theater of cruelty rely on spectacle to obscure and “smuggle” past the violent rituals of settler colonialism as normative.

For example, it is not difficult to see how Trump rallies set the stage for the normativization of white supremacy as “alt-right” or even “white nationalism” expressed in slogans such as “Make America Great Again.” The consequences of which gave rise to one of the most brazen, public displays of white supremacy and consolidation in a long time: the “Unite the Right” rally in Charlottesville, North Carolina. Despite the fact that the rally resulted in the death of Heather Heyer and injury of 19 other rally protestors, Trump has continually insisted that there was violence and culpability on “both sides.” Such false equivalences are issued as code to his white supremacist base to draw back and inward, to circle the wagons once again, around who is what counts as white, as superior, as manifest destined colonizer.

Ultimately, however, as Memmi (1991) argues, “colonization can only disfigure the colonizer” (p. 147). As he sees it, the settler subject has only two choices, both of which are equally “disastrous”: the acceptance of “daily injustice” for one’s own benefit on the one hand or a “never consummated self-sacrifice” on the other (pp. 147–148). And, since a life of guilt, shame, and anguish is virtually “unlivable,” Memmi surmises that the colonizer will typically choose to “confirm and defend the colonial system in every way” (p. 147). That said, he also wonders, “but what privileges, what advantages, are worth the loss of his soul?” (p. 148). And therein lies the essence of settler “uneasiness.”

The apparent hopelessness of the settler problem raises important questions about the structure and potential of social movements, coalition building, and the possibility of transformation. Questions asked with even greater urgency as the United States joins the global, right-wing turn toward authoritarian populism.

Indigenous Refusal and the Twenty-First-Century Ghost Dance

As articulated by Indigenous scholars, Julian Brave NoiseCat and Anne Spice, “At Standing Rock, the audacious vision for an indigenous future, handed down from Wounded Knee and global in force, is alive and well.” In order for this “audacious vision” to be fully realized, it is up to all of us to see and work past the glimmer of spectacle, to resist the cult of the immediate, and to do the more deliberative work of history, earnestly connecting past with present. This requires a collective refusal to participate in the theater of cruelty and choose instead to dismantle the settler consciousness that enables it. Such efforts entail working beyond and below the surface, keeping an eye toward the process by which relations of mutuality are either abandoned or eroded by relations of capital – to in effect, decolonize.

Within this struggle, Indigenous nations, peoples, and knowledge are crucial, not because they hold any magic or “ancient wisdom” but because they represent the most enduring and resilient entities that present a competing moral vision to the settler order. Despite myriad struggles, Native peoples have maintained their autonomy and political sovereignty for centuries, confounding the infamous Thatcherism, “There is No Alternative.” And insofar as current patterns of thinking and being have contributed to the existing political, economic, and environmental crises of our time, it is incumbent upon all of us to protect the complex ecologies that sustain Indigenous communities. That said, I want to be clear that by “protect” I do not mean appropriate, mimic, exploit, or put on display. I mean to create and sustain the conditions under which such communities continue to survive and thrive.

Settlers desiring to be accomplices in the decolonial project need to assume the stance of advocate (not spectator) for Indigenous rights and perhaps more importantly, for *whitestream transformation*. Within activist spaces this means demonstrating a willingness to stand on the front lines to help contain the metastasizing neoliberalism. As argued by Glen Coulthard (2014), “For Indigenous nations to live, capitalism must die” (p. 173). This also necessarily demands a prior rejection of liberalism. Particularly now, as pundits and scholars begin to dissect the “success” of #NoDAPL, it is important to register the long-understood failures of liberal politics and belief in reform – of the liberal subject, of capital, of the state – through “peaceful” action and “rational” discourse. Any movement that does not first recognize the irrationality and violence of the settler state and its envoys is by definition anti-Indian.

It means recognizing that “the movement” is not (only) about the present but rather demands both history and a ground(ing) that is both literal and metaphoric. The guiding vision is not human centered or derived but rather comes from land and all that sustains it. The less quoted, second half of Coulthard’s (2014) assertion is, “for capitalism to die, we must actively participate in the construction of Indigenous alternatives to it” (p. 173). The Indigenous project is not defined by liberal or juridical notions of justice. Indeed, liberalism’s reliance on the fantasy of the benevolent state and its refusal to relinquish the idea of a “new social order, built in the shell of the old,” ultimately solidifies the settler state. The so-called progressive movements built on liberal ideas give rise to organizing strategies held captive to the “reign of the perpetual present.” Such politics were epitomized by the Occupy Wall movement – its never-ending process of agenda building, leaderless and lateral structure and non-prescriptive slogan, “What is Our One Demand?” – all suggest an allegiance to the liberal ideal of freedom as individual liberty.

In contrast, Indigenous struggle is built on history and ancestral knowledge. It is informed by original teachings and the responsibility to uphold relations of mutuality. Attention to these teachings requires resistance and refusal of the fast, quick, sleek, and spectacular in favor of the steady, tried, consistent, and intergenerational. It is the replacement of “to each his own” and “may the best man win” with “we are all related.” As Debord observes, the spectacle is “the reigning social organization of a paralyzed history, of a paralyzed memory, of an abandonment of any history founded in historical time” and, thus, “is a false consciousness of time” (158). We must refuse this false consciousness.

In the end, refracting liberal, social justice movements through an Indigenous lens compels us to be attentive to both the larger ontological and epistemic underpinnings of settler colonialism; to discern the relationship between our struggles and others; to disrupt complicity and ignite a refusal of the false promises of capitalism. This level of clarity removes the messy and participatory work of agenda setting that liberal movements insist upon, because, the agenda has already been set – a long time ago. It is about land and defense of land. Land is our collective past, our present, and our future. This is our one demand.

Abstract

Digital education, technology-rich schools, and smart classrooms particularly configured by cloud-computing and blended-learning programs are growing. Participation in education is a key factor affecting the life chances for Indigenous children of the Pacific, yet they have lower rates of participation than non-Indigenous people. Pacific twenty-first-century learning requires new culturally inclusive spaces that do not override Indigenous cultures but draw upon them as a learning foundation on which to build new digital learning. Research on technology and equity as a means of raising school achievement are becoming more attractive in education systems seeking to improve school processes and outcomes. Although international research in this area is extensive, covering about two decades, there are still gaps in its research base specifically on the concept of Culturally Responsive Digital Education for Indigenous peoples. While literature on culturally responsive schooling (CRS) for academic improvement of American Indian and Alaska Natives peoples has emerged, this literature is yet to theorize Indigenous online education and complimentary teacher

pedagogy, especially in the Pacific. This chapter will define culturally responsive digital schooling (CRDS) for Indigenous peoples of the Pacific drawing from robust information communication technology (ICT) research, critical and CRS studies. This chapter first argues the need for CRDS that comprises of three interdependent dimensions of “*benefits*,” “*decolonization*,” and “*cultural responsiveness*.” Understanding these dimensions are necessary before purpose, effects, or impact of CRDS can be understood. Finally, the chapter defines CRDS and proposes a ten-point model as a cultural standard to support CRDS Indigenous schooling in the Pacific.

Introduction

Na marni purrutye marni “Defining Culturally Responsive Digital Education for Classrooms” pepe. Welcome to this chapter “Defining Culturally Responsive Digital Education for Classrooms.” *Ngai narri Lester-Irabinna Kudnuitya Rigney.* My name is Lester-Irabinna (Warrior), Kudnuitya (name of third child if son) Rigney. *Ngai yaitya meyu Narungga, Kaurna, Ngarrindjeri, Buhhiyanaunungho.* I am a man from the Nations of the Narungga, Kaurna, and Ngarrindjeri. *Ngai Taihurtinna Nellie Raminyemmerin Yakkana Ivaritjiburha.* I am a descendant of Nellie Raminyemmerin who is the sister of Ivaritji. *Pangkarra ia, Kaurnako yerta warrabutto pepe.* This is Kaurna country (Adelaide Plains) where I write this chapter.

As is my cultural custom before speaking, it is important to locate myself in Kaurna language protocol that respects the laws of my Narungga, Kaurna, and Ngarrindjeri cultures. Speaking (in this case writing) in Kaurna language before entering into English dialogue acknowledges Kaurna land on which this chapter was written and makes transparent the position from which the author conceptualizes and argues for culturally responsive digital schooling.

Indigenous peoples in the Pacific do not want to be excluded from the economic and political opportunities shaped by technology. We want our governments, schools, and teachers in Oceania to skill our children in the benefits of e-commerce to improve our poverty. We want biotechnologies to protect our land and sea organisms. We need access to technologies to transform our status as oppressed colonial subjects. We recognize that modern information communication technology (ICT) and mobile phones have changed the world and its cultures. Now the foundation of all economic, social, and educational activity, these technologies have become important to society and are regarded as critical to improving quality of life (Radoll 2015). As digital technologies become ever more central to school and work, the disadvantages of not being connected increase. Many across the Pacific, including three million Australians, experience digital exclusion that deepens social, economic, and cultural inequalities. Despite unequal schooling and the widening of achievement gaps, Indigenous peoples of the Pacific are calling for schools to build

essential skills through the enormous resources of the Internet to engage how and when they want and wherever they live (Keegan et al. 2011; Radoll 2015; Rigney 2011a; Smith 2003).

Digital education and ever-increasing access to online learning promise to improve schooling processes and outcomes. Digital education, technology-rich schools, and smart classrooms particularly configured by cloud computing and blended learning programs are increasingly present in education systems. Participation in education is a key factor affecting the life chances for Indigenous children of the Pacific, yet they have lower rates of participation and/or success than non-Indigenous people. Pacific twenty-first century learning requires new culturally inclusive spaces that do not override Indigenous cultures but draw upon them as a source of learning foundation on which to build new digital learning.

Education reformers, researchers, and teachers view the use of ICTs in teaching and learning as a means to enhance teacher competency and thus deliver improvements in student outcomes within disadvantaged schools (Rizvi and Lingard 2009). Specific claims of digital education having power to improve Indigenous learning outcomes through building teacher and school capacities are in their infancy, with empirical studies supporting such claims not well established. Furthermore, although international research on technology and equity is extensive, there remain gaps in its research base, specifically on the concept of culturally responsive digital schooling (CRDS) for Indigenous peoples – especially in the Pacific (Warschauer et al. 2004).

This chapter is informed by three vast literature sets: critical theory; ICT studies; and culturally responsive schooling (CRS). It argues that although the plethora of writing about technology and equity schooling reviewed here is insightful, it has dealt little with Indigenous digital education, teachers work, and the need for online empowerment. Blind spots include a definition of CRDS from an Indigenous Pacific perspective and the theorization of the CRDS concept or construct that privileges Indigenous values, interests, aspirations, and epistemologies (Carlson 2013; Donovan 2007; Keegan et al. 2011; Rigney 2011a; Radoll 2015). This research gap possibly explains why there is no agreed universal definition of CRDS or a model of cultural standard that supports it in schools. This also raises another gap in the research in the lack of theorization on the causality or effects of CRDS on improving Indigenous performance outcomes. Therefore, there is a clear need for more social and empirical theorization to explore the claims made about the effects of online education on student improvement.

Educator Mark Warschauer (2003) stressed that research about new technologies and social inclusion has focused on the oversimplified notion of a “digital divide” that can be overcome by providing equipment to the poor, and must shift to explore how teachers can improve student’s ability to use technologies for greater societal participation. Warschauer (2003) rightly argues that such ability to access, adapt, and create knowledge using ICT is critical to social inclusion. This chapter seeks to extend the notion of “digital divide” in education beyond exploration of the gaps in ICT access, and toward conceptualizing the effective integration of ICTs into Pacific schools in ways which increase Indigenous people’s online ability to engage in meaningful social practices. Beyond the intermediary effects of culturally responsive

digital schooling (CRDS) on Indigenous learning outcomes, there is also a need to look beyond the classroom to the desire and purpose of CRDS from Indigenous perspectives based on three interdependent dimensions: “benefits,” “decolonization,” and “cultural affirmation.” This chapter proposes that these three intimately related dimensions provide important context to understanding Indigenous theorization of CRDS and that understanding these dimensions is necessary before purpose, effects, or impacts of CRDS can be understood.

Literature that has emerged from the United States on culturally responsive schooling (CRS) for academic improvement of American Indian and Alaska Native youth (Castagno and Brayboy 2008) has as its common characteristic and strength a theorization of education that is informed by Indigenous first peoples’ epistemologies ontologies and cosmologies. Yet it lacks theorization of Indigenous online education and complimentary teacher pedagogy especially in the Pacific, an absence which leaves a major research gap in the CRS literature. This chapter will define culturally responsive digital schooling (CRDS) for Indigenous peoples of the Pacific drawn from robust ICT studies, critical social science, and CRS studies. Drawing heavily on the CRS literature, the chapter defines the construct of culturally responsive digital schooling as an epistemological construct. In other words, the effects of cultural responsive digital schooling on student outcomes are affected or moderated by school context and Indigenous epistemological views of how knowledge is constructed and transmitted.

Finally, the chapter outlines the purpose of culturally responsive digital schooling from an Indigenous Pacific/Oceania perspective and discusses its characteristics for future schooling of Indigenous children. Currently, there is no definition of CRDS and we as Indigenous peoples of the Pacific are constrained in our capacity to determine future formations of our digital world act to produce. The primary aim of this chapter is to propose a ten point CRDS model as a cultural standard to transform the way we educate teachers and Indigenous students in Pacific schools. Presenting this theoretical model on CRDS provides a framework based on Indigenous epistemologies to build Indigenous First Nations Oceanian futures. As more interest and investment of resources are directed to technology in schools for improvement, there is an urgent need to develop a research agenda on this kind of CRDS model as a cultural standard capable of supporting the claims of digital improvement in Indigenous education.

Benefits of ICT and the Internet

Converging technologies that exemplify information and communication technologies (ICT) include powerful new tools of the Internet and Web 2.0-capable devices such as computers, tablets, mobile phones, and social media. Although ICT is often considered an extended synonym for information technology (IT), its scope is broader. The Internet is a driver of change. It has mobilized many human endeavors, produced globalized information exchanges, and developed new emerging e-commerce to move goods and services. Studying globalized schooling Rizvi and Lingard (2009: 153) conclude that “educational opportunities are shaped by access to technology.”

Digital literacy skills born from school connect individuals to benefits of the Information Revolution. ICT careers include banking, health-care, software technicians, IT support, and multimedia to name a few. Wagner (2008) argues that the new world of work will require schools to develop skills in problem solving, collaboration, adaptability, entrepreneurialism, communication, analytics, and imagination. The Internet is widely used in school for teaching, news, entertainment, and keeping touch with parents, students, and staff.

Outside of schools, political, economic, and institutional applications have been central to the Internet's history. The United States organization *Partnership for twenty-first Century Skills* indicates that a "growing number of multinational corporations" require as prerequisite skills "abilities to network with people across boundaries from different cultures and languages" (Wagner 2008: 25). Wagner supports the idea that digital entrepreneurialism requires schools to build student core competencies in global awareness of diverse cultures to thrive in the changing nature of collaboration in today's workforce.

Many tribal communities and Indigenous educational leaders, as well as a number of Indigenous scholars in the Pacific, advocate for the benefits of ICT. Keegan et al. (2011) highlight the importance of web-based Maori language dictionaries, resources, and lessons (e.g., Ngai Tahu) for successful Maori language and cultural revitalization. In Australia, Leavy (2014) outlines best practice in ICT to preserve and maintain Aboriginal virtual heritage. Donovan (2007) and Radoll (2006, 2010) consider how teachers can use the connection between Aboriginal Pedagogy and ICT to engage Aboriginal students in an Aboriginal way. Rigney's (2011a, b, c) and Rigney et al. (2013) studies confirm the need for CRDS to promote greater social inclusion and the need to draw on 20,000 years of relevant cultural epistemes.

Carlson (2013) examines the rapid rise of social media among Aboriginal Australians and how it is used to communicate self-representation to other online communities. Podber's (2014) research suggests that the interrelationship of oral tradition and technology has revolutionary potential for social change. Similarly, the Tangentyere Council and Central Land Council (2007) outline mobile phone use among low-income Aboriginal people and how remote Australia seeks to utilize technologies for empowerment. From this research, it is understood that challenges and opportunities for Indigenous education in the twenty-first century abound and are potentially accompanied by benefits across welfare reform, heritage protection, health care, and workforce growth. Indeed, these public policy and schooling contexts and goals must be intentionally considered and pursued for ICTs' potential to "leap frog" economic and social disadvantage is to be realized (Davison et al. 2000).

Liberating Digital Possibilities: Empowerment in Indigenous Oceania

The author of this chapter argues that Indigenous Pacific futures are tied to Indigenous digital entrepreneurialism propagated by innovative schools. Indigenous digital entrepreneurialism is defined here as digital emancipation and empowerment through schooling to nurture Indigenous entrepreneurs who will create online

systems, enterprises, and platforms for Indigenous futures that are new and optimistic. Teachers in modern classrooms engaging young people to build the Indigenous Pacific of the future need to be giving pedagogical tools to honour students' entrepreneurialism. But discourses of entrepreneurialism are rarely used about the Indigenous Pacific.

In Oceania, colonial-inspired derogatory views of Indigenous cultures pervade. For the reader to understand why we in Indigenous Oceania believe that information technology has become fundamental to equity policies, they must first understand that Oceania's Indigenous "digital divide" is inextricably linked to Pacific colonialism by distant European Empires. Equally important for the reader to understand is what we mean by decolonization. For us a decolonized Pacific is one that is secured firmly to an Internet future that is affordable, socially just, liberating, profitable, and a means to mobilize Indigenous Oceania for our self-determination. The goal of decolonization carries the dreams and aspirations of the colonized peoples of the Pacific. An important question is why?

Bevacqua (2010: 80) writes "that amongst the 16 remaining official colonies in the world left today (as recognized by the United Nations) 14 of them are islands in the Pacific, Atlantic or Caribbean." Bevacqua highlights that 2010 ends the "second decade of UN attempts" to eradicate colonialism and notes that this "is failing miserably" (2010: 80). Early European interactions with Indigenous cultures often constructed us as lazy, heathen savages, constructions that have had prolonged and sustained negative impacts on people's views of us and even our own Indigenous views of ourselves.

European Imperial voyages and migrations through the Indigenous Pacific over the past hundreds of years confined Indigenous mobility to fictitious imperial borders, shaped our schools and determined whose knowledge is valid and whose is excluded (Rigney 2006; Connell 2007). Prevailing colonial views of the modern Indigenous Pacific include the language of disadvantage, isolation, and welfare dependency (Moreton-Robinson 2000; Larkin 2014; Arbon 2008). The Pacific was seen as joke, the cause of dangerous isolation, a place where you dump your convict undesirables, and waste land to test nuclear weapons.

The claim that the Indigenous Pacific had no history or literacy stems from Western representations of Pre-colonial Oceania (Smith 1999; Thaman 1988, 1993; Bishop et al. 2007). European colonial expansion replaced Indigenous knowledges and schools with European versions (Moreton-Robinson et al. 2012). As Heugh (2015) points out the emergence of scientific rationalism, nation-state ideologies in the seventeenth and eighteenth centuries, followed by mass education in the nineteenth century, resulted in the marginalization and silencing of minority communities and an invisibilization of their languages, knowledges, and cultures across Europe. This process coinciding with European colonization has been replicated across Africa, the Americas, much of Asia, and the Pacific.

Tongan scholar Epeli Hau'ofa, a prominent thinker in disrupting colonial narratives and Pacific Islander Studies, claims that colonization and its imaginary borders interrupted trading that was otherwise unimpeded across large seas from Australia, United States, Canada, Polynesia, and Micronesia (Hau'ofa 1994). These trade

winds routes promoted interconnection and communication that was practiced by ancestors and is still reinforced today. Languages and cultures in the Pacific interlinked and were woven into epistemology, ontology, and cosmology. Hau'ofa's (1994) seminal essay "Our Sea of Islands" charts a grand regional vision to profoundly reimagine the Pacific to promote Indigenous interests beyond such colonial inscriptions.

His vision includes the decolonization of the Pacific and the rejection of pervasive hegemonic notions of "smallness, isolation and dependency" born from ways others see the Pacific (Hau'ofa 1994: 148). Instead he calls for the re-establishment of order through restoration of Indigenous Pacific collaboration that binds cultures for a common identity to build new and sustainable futures for self-determination. Hau'ofa's view is that we are the minority of the Pacific, but we continue to remain the Majority. For Hau'ofa, the modern project of decolonization must draw on past cultural innovation legacies in order to thrive in the ocean while using technologies to build new economies.

This chapter proposes the need for digital entrepreneurialism in schools that mobilize the Indigenous Pacific collective for transformative action toward fulfilling Hau'ofa's vision. Liberating digital possibilities optimistically seeks empowered change from smallness, isolation, and dependency. Hau'ofa's renewed reformation of Indigenous Pacific identity through technology is not a call to return to pre-European pasts resistant to modernization. Instead, he pursues futurist collaboration with those who are willing to decolonize. Digital revolution for the kind of Indigenous entrepreneurialism argued here delivers power to Indigenous Pacific to control their own futures.

Like Hau'ofa, other Indigenous scholars and thinkers seek counter-narratives to settler-versions of schools that embrace digital inclusion and empowerment. Oceania bounds together numerous writers including: Aboriginal Australians; New Zealand Maori; Indigenous Hawai'ians; First Nation US west coast mainlanders; First Nation west coast Canadian; and Indigenous peoples from the vast "Sea of Islands" across the Pacific (Fredericks et al. 2014; Moreton-Robinson 2000; Smith 1999; Arbon 2008; Martin 2008). These alternative discourses argue that schooling must be culturally responsive to revitalizing and empowering Indigenous communities. Technology and schooling must enable Indigenous First Peoples to de-link from post-colonial habitus toward pluri-versal views of a collective political and economic future.

Digital Divide, Schooling, and Equity

Are Indigenous students of the Pacific ready for a technology-rich world? According to Rizvi and Lingard (2009) in a "knowledge economy, education opportunities are shaped by access to technologies." They outline the digital divide as: "unequal internet access" between industrialized and developing societies; the "social divide" between information rich and poor; and a "democratic divide" between those who can use the Internet and those who cannot (Rizvi and Lingard 2009: 154). Thomson

and de Bortoli's (2007) analysis of OECD 2003 PISA education tests concludes that while all Australian and New Zealand students have access to a computer at school, and most also have computer access at home, fewer Aboriginal and Maori students have access at home. They conclude that students with access to a computer at home frequently achieved at a higher level in mathematics than those students with no such access. OECD member countries continue to invest in ICT to build productive workplaces and as such there is an increasing demand for schools to adapt curriculum to produce technologically literate students (OECD 2012b).

The 2001 and 2006 New Zealand census indicated Maori use of ICTs continues to be low and that a digital divide existed with 25% of Maori households having access to the Internet compared with 45% of other New Zealand households (Keane 2012; Statistics New Zealand 2001). Of the two biggest island nations in the Pacific, OECD (2012a) studies reveal that Maori and Aboriginal Australian households are the least connected due to low income and high cost of technology. The Australian Index of Digital Inclusion (Thomas et al. 2017: 16) highlighted that the gap between Indigenous Australian and non-Indigenous Australian's digital inclusion cannot be explain by low socioeconomic status alone and that "there are important distinctions in how Indigenous Australians access the internet" and as such, even as their "technology adoption increases [...] aspects of digital exclusion may persist" for Aboriginal Australians. This creates what Wolff and MacKinnon (2002) call an "information underclass." Where Indigenous peoples of the Pacific experience higher connectivity at school than at home, schools become crucial sites for effective use of gained knowledge to enact Indigenous digital empowerment and entrepreneurialism. To reduce the "digital divide" and the "information underclass" requires, among other priorities, the development of culturally responsive digital schooling while transforming curriculum and teacher pedagogy.

Research on technology and equity has mainly centered on unequal physical access to computers and the Internet, through lenses of race, income, and education (Warschauer et al. 2004). With the intensification of ICT use over the past decade, technology is now considered important to addressing education inequality. Warschauer et al. (2004: 563) conclude that new technologies are a double-edged sword that has the potential to either alleviate or exacerbate existing inequalities. If ICT is distributed equally and is designed and deployed in well-considered ways, it can contribute to societal inclusion, while unequal access and/or colonial configurations at home and school will widen the digital divide and social exclusion. The Internet and its societal transformations present enormous opportunities and challenges for schools (Selwyn and Facer 2007; Fink and Kenny 2003; Wolff and MacKinnon 2002).

Pacific schools are located within a geographical and political region that has the most heterogeneous levels of ICT development globally (International Telecommunication Union 2016), with international aid for ICT development reducing since the mid 1990s on the presumption of the private sector playing an increasing role in the provision of ICT infrastructure (OECD 2005). Although Australia, New Zealand, and some Pacific Island Nations have made considerable advances to bridge the digital divide, rural villages and Indigenous communities remain the most

underserved sections of society (Organisation for Economic Co-operation and Development 2012a, b).

Indigenous peoples of the Pacific seek more than being consumers of technology but want to be producers, managers, and creators. Digital inclusion that only considers issue of access is not enough. This chapter defines Indigenous digital inclusion as: equal Indigenous ICT access that empowers Indigenous peoples and increases skills and capacities to exercise their fundamental rights and freedoms as first peoples in the Pacific. In the spirit of our ancestors we seek digital self-determination, digital empowerment, digital entrepreneurialism, digital equity, and digital excellence. An effective technology pathway to full empowerment and participation in a digital society is via schools. But a central question is how?

Defining Culturally Responsive Digital Schooling

In seeking to define digital education agenda for the Indigenous Pacific the emerging literature on culturally responsive schooling (CRS) offers valuable insights. Relevant themes include: Indigenous culture based curricula (Demmert and Towner 2003), culturally and epistemologically responsive pedagogy (Ladson-Billings 1995; Villegas and Lucas 2002; Castagno and Brayboy 2008; Klump and McNeir 2005), cultural classrooms (Delpit 1995); American Indian pedagogies (Cajete 2001; Grande 2004; Swisher and Deyhle 1989); Multilingualism and multi-literacies (Dick et al. 1994; McCarty and Watahomigie 2004); Alaskan pedagogy (Swisher and Deyhle 1989; Alaska Native Knowledge Network 1998); and New Zealand Kaupapa Maori (Bishop et al. 2007; Smith 2003, 1991). In Australia and other Pacific areas, this issue has been articulated in a number of key policy texts (Rigney 2011b, c; Taufe'ulungaki 2002; Nabobo 2006; Teairo 2003; Thaman 1988).

This body of research illuminates the important roles curriculum and pedagogy play in improving achievement gaps. The CRS literature suggests they can play even more powerful roles for Indigenous youth if they are enacted within the context of decolonization, Indigenous epistemology, ontology, and cosmology. In previous work on Indigenous Australian epistemologies within the CRS domain, the author argued for three integrated principles that include: knowledges that brings emancipation from the unjust Aboriginal human condition; knowledges that uphold the integrity of Indigenous languages, beliefs, and values; and knowledges that privileges Indigenous voices (Rigney 2006). The key point relevant to CRDS emerging from this work on epistemology is the centrality of Indigenous worlds, ways of knowing, speaking, seeing, and being to all forms of curricula, pedagogy, and teacher–student relationships (Rigney 2001, 2002, 2006).

The conclusion reached was that any education system digital or otherwise that attempts to disrupt or dislodge Indigenous languages, cultures, and epistemes from Pacific schools weakens their cultural fluency repertoire needed to bridge other languages of power (Rigney 2002). This view concurs with Battiste (2002) that not all ascribe to the same Indigenous epistemology and that it is diverse in definition. She defines epistemology as “Indigenous knowledges and technologies”

that “sustained their cultures” and “passed to generations” (Battiste 2002: 2). This diversity is seen within two important examples of culturally responsive schooling that inform the digital entrepreneurialism framework proposed in this chapter.

One of the many alternative versions of culturally responsive pedagogy, Gloria Ladson-Billings (1995) work is focused primarily on improving learning outcomes for African-American children. Her version of culturally responsive pedagogy “rests on three criteria or propositions: students must experience academic success; students must develop and/or maintain cultural competence; and students must develop a critical consciousness through which they challenge the status quo of the current social order” (Ladson-Billings 1995: 160). Villegas and Lucas (2002) propose that to increase classroom cultural and linguistic diversity good teaching must have six characteristics: is socioculturally conscious; has affirming views of students from diverse backgrounds; is capable of bringing about educational change that will make schools more responsive to all students; is capable of promoting learners’ knowledge construction; knows about the lives of his or her students; and uses his or her knowledge about students’ lives to design instruction that builds on what they already know while stretching them beyond the familiar (Villegas and Lucas 2002).

Although the work of Ladson-Billings (1995) and Villegas and Lucas (2002) is relevant for building culturally responsive digital schooling, the author argues for two important points of departure. Firstly, online environments now allow Indigenous children to create their learning, beyond that which is designed by adults, using their cultural funds of knowledge, languages, and epistemologies. The social nature of technology and digital platforms provide the teacher with new opportunities for student self-expression, information gathering about students own cultures, and to create cross-cultural collaborative learning throughout the Pacific. This is the underlying technological basis of the society those in the Pacific now inhabit. Secondly, in ways not imagined by Ladson-Billings, Villegas, and Lucas, using digital classrooms makes achievable the development of local online Indigenous content related to the Pacific context in which parents, local elders, and community stakeholders can be encouraged to participate. Such activities simultaneously expand the languages available on the Internet by prioritizing local Indigenous vocabularies and literacies that predate colonialism in the Pacific by thousands of years.

Given these new and ever-emerging digital possibilities, CRDS must contribute to changes in the dominant educational paradigm in relation to the nature of what it means to know, the role of the teacher in the learning process, and the relationship between the teacher and student. In digital classrooms, the teacher is no longer sole expert or the center of all wisdom, a position that has predominated in the profession for decades. Rather the role of teacher is far more complex as mentor and leader while providing learning experiences for students to achieve creative and personal interdependence through web technologies.

In New Zealand, principles of culturally responsive pedagogy from Kaupapa Maori education scholars reinforce this necessary shift in teacher role as all knower. Kaupapa Maori education sees: power as shared between teacher and student; culture as counting; Maori being Maori as priority; learning as interactive and dialogic; connectedness as fundamental to relations; and a common vision of

excellence for Maori in education (Bishop et al. 2007: 15). Similarly, the Alaskan Native Knowledge Network Culturally Responsive Teacher Standards include: teaching philosophy encompassing multiple worldviews; teacher competency in learning, theory, and practice knowing how students learn; teaching for diversity; content related to local community; instruction and assessment building on student's cultures; learning environments using local sites; family and community involvement as partners; and continuous professional development (Alaska Native Knowledge Network 1998). When grafting this work onto modern technological developments and digital-learning contexts, it is important to note that such pedagogies do not dismiss the specialist knowledge of the teacher, nor their pedagogical expertise and authority. Rather, they compelling see inherent reciprocity in the relationship between teacher and learner for empowerment. The current generation of Web technologies provide opportunity for the nature of such relationships to nurture personal interdependence for students to pursue their own agency.

The field of Indigenous Studies research in Australia also has valuable insights for virtual learning environments that are categorized into four main areas: Indigenous funds of knowledge and epistemologies (Buckskin et al. 2010; Rigney 2006, 2011a,b; Ma Rhea 2015; Perso 2012); community engagement, improving teacher pedagogy, and high student expectation (Ma Rhea et al. 2012; Sarra 2007; Craven et al. 2005); Anti-racism and social justice education (Hattam et al. 2009; Comber 2016); and students at risk strategies (Krakouer 2015; Freebody and Freiberg 2012; Aveling 2012). Although digital literacy is touched upon by a number of these scholars, it is rarely a central theme. What is common in this literature is that teachers' attitude to students and their understanding of students' cultures have shown to improve academic performance. In other words, success requires teachers' knowledge of local cultures, community involvement, and schools that are culturally responsive to, and compatible with, the community environments that surround them.

Synthesizing these CRS research findings makes evident the need for inclusive digital environments for successful learning to adopt a strengths-based approach that privileges Indigenous epistemologies and ways of knowing. The message is clear: any technology-based learning or good culturally responsive digital schooling system should have three purposes:

1. Provide all Indigenous students who want to learn with access to technology
2. Empower all Indigenous students to empower others
3. Connect e-learning to ways that take into account the sovereign status, self-determination, and digital entrepreneurial goals of Indigenous First Nations communities

The ramifications of digital schooling for Indigenous youth are complex. This includes the inherent right of tribal groups peoples to determine the digital nature of schooling for their youth and how best to benefit from technologies and digital platforms now available in the Pacific. At present, there is no Indigenous definition of culturally responsive digital schooling, nor are there articulated conceptual frameworks for greater digital inclusion. Unfortunately, the theory and practice of

culturally responsive digital education in Australia is insufficiently developed, has had no significant peer-evaluated reviews, and currently has only a few productive advocates (e.g., Rigney 2011a, 2013, 2014; Radoll 2010, 2015; Yunkaporta and McGinty 2009). To propel the Indigenous of the Pacific to be ICT-savvy nations there is a need to define digital inclusion and conceptual frameworks for culturally responsive digital schooling.

In this chapter, the author defines culturally responsive digital schooling as:

Schooling that uses dialogical and participatory teacher pedagogies, which authentically connect learning of subject-specific knowledge to the lifeworlds, epistemological experiences, and languages of Indigenous students, for both improving learning outcomes and addressing social inclusion challenges.

This definition recognizes that ICT-access alone, whether in schools or Indigenous homes, is not the solution to Indigenous poverty or inequality in the Pacific. Rather, being digitally literate, a necessary precursor to being able to efficiently contribute to and access benefits from digitally transformed economies and societies, requires enabling school environments accompanied by inclusive ICT infrastructure and policies. For this definition of culturally responsive digital schooling to be realized, it will be necessary for professional learning in which teachers and educators engage to redefine schooling and pedagogy to meet the requirements of twenty-first century Indigenous learners. Teaching in the Pacific will have to undergo pedagogical changes that match the evolution of digital delivery technologies. School and pedagogies continuously evolve. Digital tools, implemented in culturally responsive ways, can help to facilitate, further, and perhaps even improve the outcomes and processes of existing pedagogies.

Thus, culturally responsive digital schooling and its new pedagogies seek to engage diverse learners and connect students to learning communities, knowledge, and experiences beyond the classroom to empower and improve their lives. To underpin these aims, the author proposes ten standards for culturally responsive digital schooling:

1. Ensures teacher qualifications in ICT teaching and student e-learning
2. Provides students and community access to technology to build skills to participate in online environments and economies
3. Engages parents, local elders, and community as partners to develop local Indigenous digital content
4. Provides e-learning that builds on students' cultural epistemologies, ontologies, and cosmologies
5. Advocates a strengths-based approach to Indigenous e-learning by recognizing the skills, funds of knowledge, and world views students bring with them to school
6. Emphasizes web-based financial, social, and individual cyber safety
7. Cultivates twenty-first century workforce skills of problem solving, adaptability, communication, and analytics

8. Expands languages available on Internet by prioritizing local Indigenous languages and cultures
9. Engages three digital learning purposes: (a) Provide all Indigenous students who want to learn with access to technology, (b) Empower all Indigenous students to empower others, and (c) Connect e-learning to ways that take into account the sovereign status, self-determination, and digital entrepreneurial goals of Indigenous First Nations communities and
10. Reconnects traditional Indigenous engagement and communication across the Pacific and builds core competencies in global awareness of other diverse cultures

Indigenous children of Oceania live in a multitasking, multifaceted, technology-driven, diverse, rapidly changing world. Pacific twenty-first century digital learning and information technology requires new spaces that are culturally safe, coherent, and consistent with Indigenous interests and values. They require learning spaces that do not override Indigenous epistemes and cultures but instead draw upon them as a source of learning foundation on which to build new digital learning structures. They need schooling that connects school, home, country, and community learning in successful ways. Further conceptualization, and enacted programs and evaluations of culturally responsive digital schooling as defined here, framed by the ten principles outlined, are now imperative to bridging the digital disconnect in the Pacific and sustaining and transforming Indigenous Pacific futures.

Conclusion

This chapter has outlined a meaningful purpose and definition of “cultural responsive digital schooling” that moves beyond settler-versions to empower Indigenous communities and Pacific futures. Any program to reduce the Indigenous digital divide must involve teachers, schools, and Indigenous communities as partners. How do we prepare Indigenous students of the Pacific for technology-rich worlds, while retaining and sustaining their languages and cultures that are central to their self-determination? Given the fast uptake of Web-based technologies globally we must develop strategies for educators to meet both of these imperatives. Schools are part of the solution to generate digital innovation and sustain socioeconomic well-being of all children including ours in the Pacific.

be used in education to reinforce the notion that Māori students descend from a long lineage of scholars, scientists, philosophers, and the like – negating the powerful effect of stereotype threat (Steele 1997).

The recognition and reactivation of iwi knowledge in one iwi region of Aotearoa, New Zealand was an act of reclamation, remediation, and renaissance, whereby notions of *mana tangata* (student success – expressed as status accrued through one’s leadership talents and respect from others) were reconceptualized by drawing on the richness of iwi genealogy, narratives, and worldview. The Ka Awatea (A new dawn) Project was an iwi case study that examined the qualities of “success” through a quintessentially iwi lens by grounding the research undertakings in iwi protocols and history and linking findings to historical iwi icons. By emphasizing the key qualities of ancestors, we can better understand what enabled them to make outstanding contributions to the society of their era, and their feats can continue to guide the pathways to success of Māori students in contemporary times. To effect educational transformation and reform, local high schools, in conjunction with iwi in the region, then made a conscious and unapologetic call to carve out time and space to affirm this iwi knowledge – legitimizing its dignity, identity, and integrity. Speaking to Māori student success from a distinctly iwi perspective has revitalized cultural pride among Te Arawa students connecting learning to their *mana tangata* – their proud histories, tenacious present, and promising futures.

Introduction

The English-medium classroom does not speak the language of our children. It does not include their Māori ways of knowing in the curriculum, nor does it hold any of their ancestors up as role models of academic excellence. Yet, Māori know vis-à-vis whakapapa (genealogy), pūrākau (moral stories), and our distinguished history of whaikorero (oratory) that they descend from a long line of greatness. The discourses within Māori communities themselves do not focus on academic underachievement and deficit. Instead, the focus is on the strengths, wisdom, and skills our children have developed or need to develop, to flourish in their own community and family contexts as well as wider society. Māori families want their children to learn in schools that teach them that their ancestors were great philosophers, scientists, mathematicians, entrepreneurs, and researchers. Māori parents also want their children to stand tall in the knowledge that they have a rich and distinct heritage of scholarly endeavors; and for this to serve as a solid foundation for transformational learning, positive identity development, academic motivation, innovation, and intellectual and social development (Macfarlane et al. 2014). Our collective Māori futures rely upon it.

There is a strong relationship between Māori identity and the educational outcomes of Māori students (Bishop and Glynn 1999; Durie 2001; Macfarlane 2004; Webber 2008). The underpinning assertion is that a positive sense of Māori identity, experienced as cultural competence, cultural efficacy, and ethnic group pride, can improve the educational outcomes of Māori by ameliorating their negative experiences at school. So, what does a strong and positive Māori identity look like? Generally, positive Māori identity has been defined in terms of positive self-identification as Māori; an understanding of Māori language and culture; involvement in Māori social and cultural activities; and a close attachment to other Māori, for example, familial kinship groups, such as whānau (family), hapū (sub-tribe), and iwi (tribe) (Houkamau and Sibley 2010, 2011; Stevenson 2004). The fundamental building block in early works on Māori identity was the notion of whakapapa and genealogical linkages (Makereti 1986; Hiroa 1949). These linkages clarify one's sense of place and belonging and an individual or personal identity is often considered secondary to the dominant social identity based upon a communal way of life. Walker (1989) has also suggested that Māori identity is a social concept based on descent but also suggests that developing mechanisms by which one may ascertain Māori-ness are problematic because many are too static and/or unable to account for the multiplicity of human behavior. It is clear that Māori identity is a dynamic phenomenon predicated on social belonging and connectedness and many of these factors necessarily manifest differently in different social contexts. Indeed, the need for *social belonging*, for seeing oneself as socially connected, is a basic human motivation (MacDonald and Leary 2005) and a sense of social connectedness predicts favorable outcomes (Stuart and Jose 2014; Webber et al. 2013). A positive sense of Māori identity plays an important role in healthy adjustment and school functioning and can have a significant influence on how Māori students deal with adverse circumstances (Webber 2012).

Māori Enjoying and Achieving Educational Success as Māori

Recent statistics demonstrate that despite improved overall academic results for Māori students, the achievement gap between Māori and non-Māori in English-medium education in New Zealand continues. In 2015, the total number of Māori students leaving secondary school with NCEA (The National Certificate of Educational Achievement (NCEA) is New Zealand's national qualification for senior secondary school students) level two or equivalent was 62.2%, while the top performing ethnic groups (Asian and European) had 90.6% and 83%, respectively (Education Review Office 2016). In addition, the Programme for International Student Assessment New Zealand Summary Report (OECD 2016) continues to highlight the fact that Māori students score below the average score for New Zealand, and the OECD, in all three subjects – literacy, numeracy, and science. (The Programme for International Student Assessment (PISA) is an international study that assesses and compares how well countries are educationally preparing their 15-year-old students to meet real-life opportunities and challenges) Although

New Zealand performs well overall on the PISA, the distribution of student performance in New Zealand shows that we have relatively low equality (equity) in learning outcomes, and there is a wider gap between the top 10% and bottom 10% of our students than in most other OECD countries (Education Review Office 2016).

The success of Māori students at school is a matter of national interest and a number of recent initiatives have been implemented in New Zealand secondary schools to address the educational disparities between Māori and non-Māori. Many of these initiatives have been premised on an influential Māori education strategy called *Ka Hikitia* (2009, 2013). The overall goal of the *Ka Hikitia* strategy is to enable Māori to enjoy and achieve educational success as Māori. The Ministry of Education (MOE) has described this as being when “Māori students have their identity, language, and culture valued and included in teaching and learning in ways that support them to engage and achieve success” and when they “know their potential and feel supported to set goals and take action to enjoy success” (Ministry of Education 2013, p. 13). The MOE further suggests that enabling Māori to succeed as Māori involves: (1) implementing teaching and learning approaches in schools that are engaging, effective, and enjoyable for all Māori students; (2) having appropriately high expectations for all Māori students; (3) tracking and monitoring what works to support excellent Māori educational outcomes, and; (4) developing productive partnerships with *whānau*, *iwi*, and community that are responsive and reciprocal – leading to collective action, outcomes, and solutions (Ministry of Education 2009, 2013). Yet, the Auditor General’s report on Māori education (Controller and Auditor-General 2016) stated that many schools still lack an understanding of what constitutes Māori success. This report recommended that the Ministry of Education work with schools to establish a framework for collecting cultural information (e.g., a Māori student’s ties with their *iwi*) and other information (e.g., a Māori student’s goals and aspirations) to better understand what Māori enjoying educational success as Māori means for their communities.

A number of research and development initiatives have investigated how to improve the educational achievement of Māori students in the mainstream secondary school classrooms. *Te Kotahitanga* was a research and development project that promoted an education in which: (1) power was shared between self-determining individuals within nondominating relations of interdependence; (2) culture counts; (3) learning is interactive, dialogic, and spirals; and (4) participants are connected and committed to one another through the establishment of a common vision about what constitutes educational excellence (Bishop et al. 2014). From their student interviews, Bishop et al. (2009) learned that when Māori students have good relationships with their teachers, they are better able to engage with their learning. Meyer et al. (2010) identified that Māori students who were thriving in *Te Kotahitanga* schools were proud of their Māori culture and identities, could “be Māori” as learners, rather than having to leave their culture outside school in order to succeed.

The *He Kāmano* initiative (University of Waikato and *Te Whare Wānanga o Awanuiāraangi* 2010) was a strategic school-based professional development program with an explicit focus on improving culturally responsive leadership and

teacher practices to ensure Māori learners enjoy educational success as Māori. The premise behind this program was supporting school leaders to champion and enhance the social and cultural conditions necessary to bring about positive change for Māori students. School leaders in the study evaluation reported “enhanced understandings of their own relational positions, values and beliefs towards Māori students and their communities, increased awareness of Māori students and their current achievement levels, and shared responsibility for Māori students and their achievement” (Hynds et al. 2013, p. 29). This evaluation also concluded that despite a number of gains school leaders still needed more practical advice and direct guidance on how to implement evidence-based community partnership models that are highly effective in enabling Māori students to achieve educational success as Māori.

Another project of significance was The Starpath Project, which focused on equitable outcomes for New Zealand students who were underrepresented in tertiary education, particularly Māori and Pacific students from low-decile school contexts from low socioeconomic backgrounds (Yuan et al 2010). A school’s decile rating indicates the extent to which it draws its students from low socioeconomic communities. At a decile one school, most of the students come from low socioeconomic backgrounds, while decile ten schools have the smallest numbers of students from low socioeconomic backgrounds (Ministry of Education 2013.) Starpath findings revealed a marked and persistent difference in the success rates between Māori and Pacific students, and Asian and Pākehā students. Starpath identified a number of structures and processes that limited student academic progress and replaced these with practices that could help them including enhanced data utilization, two- and three-way academic mentoring, target-setting, and ongoing tracking and monitoring of achievement outcomes and opportunities (Santamaria et al. 2014).

More recently, the *Kia Eke Panuku: Building on Success* initiative has aimed to, “give life to Ka Hikitia” (Ministry of Education 2015) by bringing together key findings from five previous programs of research and development: Te Kotahitanga, He Kākano, the Starpath Project for Tertiary Participation and Success, and the Secondary Literacy and Numeracy Projects. *Kia Eke Panuku* placed importance on staff working in their schools to use data and evidence to effect positive change in classroom and school-wide practices, systems, and structures (Ministry of Education 2015). The *Kia Eke Panuku* findings showed that in order to promote conditions for accelerating school reform, three critical factors must be present: deliberate professional acts applied with adaptive expertise; culturally responsive and relational pedagogy/leadership across the school; and powerful home, school, and community collaborations (Berryman and Eley 2017). Berryman and Eley (2017) argue that schools who focus on these dimensions as levers for accelerated school reform can close the gap between Māori and non-Māori participation and achievement. *Kia Eke Panuku* findings have suggested that schools and communities can support Māori students on their journey towards success as Māori by fostering and encouraging six expressions of Māori success: (1) living confidently – with affinity to whakapapa and at ease with a growing cultural competence in language, tikanga, and identity; (2) connected to and in harmony with the people, the environment, and systems

around about them; (3) articulate and confident in expressing thoughts, feelings, and ideas; (4) skilled in building and navigating relational spaces; (5) thinking respectfully and critically about the world and ideas; and (6) achieving qualifications from school and wider life that lead to future options and choice (Berryman and Eley 2017).

Despite the rich information from these national research projects, we still know little about how success as Māori is defined by diverse groups of Māori themselves, across diverse contexts. It is also important to decipher what factors both within school, and outside of school encourage Māori to enjoy success because, what it looks like in one context could be very different from the next. Cockrell et al. (2007) have stated that, “definitions of success, and the criteria used to determine success are likely to be unique to each school, community, and/or culture” (p. 7). This means that a one-size-fits-all approach is not appropriate for all Māori in terms a singular definition of success. There is, however, some common consensus about broad indicators of Māori educational advancement, including Māori living as Māori, participating as citizens of the world, having good health, and a high standard of living (Durie 2001). Specific notions of “success” are necessarily context dependent in that “success ‘as Māori’ means different things for different people. . .some are strongly connected with their Māori heritage, others less strongly connected” (Averill et al. 2014, p. 36). Houkamau and Sibley (2015) have explained that there are many ways of being Māori, and that cultural identity for Māori is defined in different ways such as, whakapapa (genealogy), Māoritanga (Māori way of life), iwitanga (tribal links), hapūtanga (kinship links), and whanaungatanga (family relationships). Durie (2005) has also asserted that Māori experience diverse realities that take shape based on the context within which they are formed.

According to Rata (2012), a school’s cultural environment can enhance, or constrain, Māori identities, which in turn can increase, or decrease, psychological wellbeing and engagement in learning. In mainstream settings, some of school factors which influence Māori identities in either positive or negative ways are, the teachers’ expectations for Māori students, whether or not schools initiate Māori representation in decision making, and whether there is a school-based marae or not (Rata 2012). Rata’s (2012) research implies that how well an institution understands and values te ao Māori (the world of Māori) is perhaps the most important factor determining whether Māori students will achieve success in the mainstream school setting or not. Similarly, Whitinui (2008) has long argued that kapa haka can provide a culturally responsive learning environment where students appear to participate, learn, and achieve more consistently as Māori. The research clearly indicates that schools need to be places where Māori students not only achieve academically but where they are happy and comfortable to be themselves; where they can feel at home, valued, and cherished; where they can realize their potential; and where they are able to be strong in their Māori identity. Schools which can promote this positive cultural environment are more likely to create atmospheres where students are empowered by their experiences and at school and, “develop the ability, confidence, and motivation to succeed academically” (Cummins 1986, p. 23).

Stereotype Threat and Its Impact on Academic Efficacy

Māori wisdoms, distinct iwi knowledge, and local role models matter. Not only are they important to remedying the continuing failures of the mainstream classroom, but they can also be a positive approach to dealing with the threat of academic stereotypes, low academic efficacy, low self-esteem, and poor school engagement among the Māori student population. Māori identities, localized curriculum content, and transformative school cultures matter for Māori students because they influence their perceptions about the relevance of schooling to their lives. These concepts impact Māori students in that they influence their identification with the school context (or not) and subsequently their attendance, engagement, and achievement. In most English-medium schools, Māori identity, our worldview and knowledge, and our own role models are not used effectively to enhance teaching and learning. This is troubling because school culture significantly influences Māori students' social and academic identities and subsequently affects how they respond to opportunities to learn. Māori-centric cultural values, norms, customs, ways of being, ways of knowing, and traditions can provide Māori students with a framework for interpreting reality, making sense of school content and responding to academic challenges. Furthermore, in light of the current academic disparities between Māori students and their non-Māori peers, there is a need to further examine the role Māori identity and culture can have on the attitudes, behaviors, and learning orientations of Māori students.

To increase Māori participation and achievement in education, we must address the persistent negative stereotypes and media misrepresentations that suppress their achievement. Māori student achievement continues to be impacted by negative stereotypes that allege intellectual inferiority (Turner et al. 2015; Webber 2012; Webber et al. 2013) and state-mandated statistics that perpetually portray Māori educational performance as a problem inherent to Māori people themselves (Mahuika 2008; Walker 1985). Given the power of these stereotypes to shape Māori underparticipation and disengagement from education, the depth of Māori estrangement from the compulsory education sector should not be underestimated. The ongoing sense of injustice and the continued disempowerment of Māori people as they progress through English-medium schools remain deeply painful and continue to have a profound impact on the psyche, efficacy, and motivation of Māori students (Bishop et al. 2014).

Steele (1997) has called this phenomenon “stereotype threat” and has stated that these stereotypes impact the performance, motivation, and learning of students who have to contend with them. Steele's writings (1997, 2010) highlight the way in which being the target of a negative group stereotype (even when one does not believe the stereotype) can undermine student confidence, participation, and performance in academic tasks. Steele asserts that the students who are most vulnerable to stereotype threat are those who care the most and who are most deeply invested in high academic performance. This means that the Māori students most likely to disengage from schooling contexts where negative stereotypes about their academic potential remain unchallenged are those with the highest academic potential. In essence, our

highest achieving Māori students are more likely to be negatively impacted by stereotypes that reinforce the idea that “Māori students are not as smart as non-Māori students.”

However, international literature suggests that developing a positive ethnic identity could play a protective role in Indigenous students’ lives (Miller and Kaiser 2001). According to extant research, Indigenous students who identify strongly with their ethnic group are better able to negotiate potentially negative environments, deal with discrimination and prejudice, and have high self-esteem. Other evidence (Bowman and Howard 1985; Oyserman et al. 2007) has shown that positive ethnic socialization is associated with better school efficacy, higher educational aspirations, increased cultural knowledge, and a greater understanding of the racial prejudice (Quintana and Vera 1999). More recently, Altschul et al. (2006) examined three components of ethnic identity that act together to buffer the impact of stereotype threat and strengthen persistence at school. The components are: (1) a positive sense of belonging to one’s ethnic group, (2) a high awareness of racism, and (3) a strong sense of embedded achievement. Embedded achievement is the belief that achievement is an in-group identifier, a part of being a good in-group member, and a belief that the achievement of some in-group members helps other in-group members succeed. Webber et al. (2013) examined the same components of ethnic identity with Māori students in the Aotearoa, New Zealand context and found that a strong and positive Māori identity does indeed help Māori students to buffer the potential impact of stereotypes, and subsequently engage, persist, and succeed at school.

Ka Awatea: An Iwi Case Study of Māori Student Success

Te Arawa people are a confederation of iwi that occupy the Rotorua Lakes district and part of the central Bay of Plenty coastline in Aotearoa, New Zealand. In the Ka Awatea project, a Te Arawa worldview was used to examine the connection between Māori identity and the perceived characteristics of success among a selection of nominated successful Māori high school students from Rotorua, New Zealand. In a time when “Māori enjoying and achieving education success as Māori” (Ministry of Education 2013, p. 5) was the catch phrase of New Zealand educational practice and policy, this study sought to understand the role that various academic, social, interpersonal, and cultural influences have on educational achievement as they foster and demand different understandings and identity enactments among Māori students. This iwi case study took a social-psychological perspective on questions of Māori student success in that it articulated indigenous student achievement as a concept always situated in, and mediated by, social contexts, cultural settings, and social group memberships (Macfarlane et al. 2015).

Using a Kaupapa Māori informed approach, the Ka Awatea project conducted interview/focus groups and a survey over 2 years to examine the conditions for success, and the perceptions of success, from successful senior Māori secondary students ($n = 132$) aged between 15 and 18, their whānau ($n = 58$), and their teachers and principals ($n = 93$). The successful students were nominated by their

school principals for a number of reasons: most notably, high achievement, leadership, and cultural expertise. All but one student could identify their iwi affiliations and 47% of the student participants identified as Te Arawa. All students in the Ka Awatea study attended schools in the Rotorua district. The Ka Awatea Project consequently uncovered the individual, family, school, and community conditions that enabled Māori students to mobilize various types of mana (pride and status) to achieve their educational, social, and cultural goals. It also identified eight personal, academic, and cultural qualities that exemplified successful Māori high school students from this iwi area. As such, the Ka Awatea project developed a measure, model, and definition of Māori success that was iwi specific (Macfarlane et al. 2014).

Mana: The Five Personal, Familial, School, and Community Conditions Required for Māori Student Success

One of the greatest challenges facing Māori participation in education concerns the restoration and experience of cultural pride and efficacy in the lives of Māori students. Māori scholar Te Ahukaramū Charles Royal (2006) has argued that it is *mana* (honor, pride, and esteem) that lies at the heart of Indigenous self-worth and the degree to which we feel empowered and good about ourselves. Royal (2005, p. 68) has also explained that, “. . .mana is a person’s knowledge and sense of knowing – knowing about what to do, what they ought to do and how to do what they should do.” Royal (2005, p. 68) argued,

The purpose of education is to facilitate the flow and experience of mana in the individual and in his/her community. The “fullness” of life was considered to be a function of the degree and quality of mana at play in a person’s life. The outward expression of mana in the life of the individual is evidenced not only in their skills, attributes and talents – expertise and skill was widely celebrated – but finally in their “spiritual authority,” their intuitive and wisdom filled knowledge and insight of knowing what, when, how and why to do something.

As such, the concept of mana is important for Indigenous student participation, engagement, and achievement at school because it relates to their sense of being, motivation, and personal and collective identity. Mana tangata, or secure sense of mana, can influence Indigenous students’ thoughts and behavior, enabling them to act purposefully in the world to achieve their goals and aspirations. In this way, the development of mana is crucial because it is a profoundly powerful social–psychological construct that affirms and advances Indigenous student connectedness and belonging in the school context, undoing the impact of negative societal stereotypes, including “the master narrative” (Carretero and Van Alphen 2014) that speaks of the Indigenous problem in education (McCarty and Lee 2014) and/or the long brown tail of underachievement (Torrance et al. 2015).

Royal (2005) has also argued that the purpose of education is not so much the acquisition of knowledge but rather the growth of mana in the individual. He suggests the following attributes or qualities as essential for the development of

mana in the individual: that he/she does not boast about his/her own prowess or abilities; when faced with an issue or problem, they understand traditional lore and extended discussions as a process, a way of addressing an issue/problem in order to seek an answer, outcome, or direction; they are gentle and humble; they listen to what the spirit is telling him/her; is supported by his/her people; is quick thinker, an alert mind; they adhere to their thoughts and beliefs; they are industrious, knowledgeable, and have a repository of knowledge.

In the Ka Awatea study, five mātauranga (educational) themes concerning the personal, familial, school, and community conditions for success emerged. The five themes, described below, are: Mana Whānau, Mana Motuhake, Mana Tū, Mana Ūkaipo, and Mana Tangatarua. The first concept, Mana whānau, appeared to have no bounds – it appeared with incredible regularity throughout the course of the study rendering it the most important condition of Māori student success.

Mana Whānau: The Students Came from Child-Centric Family Environments

Successful Māori students occupy a central position of importance within their whānau – and this includes the school and community “whānau” as well. The Māori students in this study were nurtured into succeeding by their whānau, teachers, and peers; were consequently socially capable; and had a sense of belonging across a number of contexts. The Māori students knew that their families valued education, and that their school success was important to the whole whānau because it had the potential to be a driver of wider whānau success.

The successful Māori students were held in high regard by their whānau, their peers, teachers, and members of the wider school community. For the main part, most of these students were placed at the heart of the whānau and were nurtured, protected, and guided towards success from an early age. Whānau saw their role as integral to the formation of healthy lifelong attitudes and learning behaviors and viewed this as a serious undertaking if their children were to realize their potential as successful Māori students and emerging adults.

This “tamariki-centric” (child-centered) positioning of Māori students was evident from the comments made by both the students and their parents. Successful students were quick to praise their parents for providing them with a safe and loving environment where encouragement and support for all their endeavors never wavered. This consistent and constant presence of care and concern in their lives made them want to try hard at school and achieve educational success. Students saw educational success as a means of paying back their parents and making them proud for all their unwavering support and the sacrifices they had made. Parents on the other hand were forthcoming about placing their children’s needs first and their own second. They recognized the vulnerability of transitioning from childhood to young adulthood and were committed to ensuring their children were advantaged by having their physical, emotional, spiritual, and cultural needs met. Parents saw this task as their primary responsibility and developed strategies to ensure that they were

equipped to support their children and that they were not disadvantaged by their own limitations. Students who were raised in tamariki-centric home contexts learnt to respond in kind and reciprocate behaviors that were highly valued by others such as respect, humility, thoughtfulness, and compassion. These skills were viewed as crucial in order to become a socially capable and identity secure individual across a range of circumstances and are essential in building towards a successful future (Tahau-Hodges 2010).

Mana Motuhake: A Positive Sense of Māori Identity

Mana motuhake (positive identity) was experienced by the students in this study via their developing sense of cultural efficacy, connection, and belonging. This included their ability and knowledge of how to engage meaningfully with Māori culture. Successful Māori students purported to have a keen sense of belonging and connectedness to others in their whānau, hapu, iwi, school, and community. All participants also agreed that knowledge of one's whakapapa (genealogy) was critical. Kāretu (1990) has described whakapapa as the glue that connects individuals to a certain place or marae, locating them within the broader network of kin relations. According to the participants in this study whakapapa is not simply about having "Māori blood" but knowing about that descent and having a meaningful relationship to it. Knowledge of whakapapa had a major part to play in the resilience of the Māori students and their ability to stay focused, as well as committed to achieving their aspirations at school for the collective benefit of their whānau, hapū, and iwi.

Whānau played the most important role in terms of socializing their children into the Māori world and helping them to develop cultural efficacy. Cultural efficacy is the extent to which an individual feels they have the personal resources to engage appropriately as Māori across a range of contexts (Houkamau and Sibley 2011). The findings of the Ka Awatea study show that the most important developmental asset a parent can imbue in their children is to ensure that they are aware of their collective belonging, cultural connectedness, and responsibilities to others. Many of the successful students in this study asserted that any decisions about themselves were made while recognizing their responsibilities to others – their whānau, hapū, and iwi. Therefore, healthy and supportive whānau are fundamental to positive Māori identity development and for promoting educational advancement.

The shaping of student attitudes towards Māori and more specifically iwi identity, and the associated languages, values, and cultural worldviews need to be a fundamental function of whānau. Constructive and supportive relationships between members of whānau including (importantly) extended whānau are important determinants of Māori student success, and lay the foundations for positive relationships in later life. Modeling whanaungatanga – that is the establishment and maintenance of supportive relationships – is also a critical whānau function that contributes to student success at school.

Moreover, iwi can also play a role in the positive Māori identity development of students. As a consequence of this study, Te Arawa developed a range of iwi-specific

resources and professional learning opportunities for teachers that promoted the inclusion of culturally rich learning opportunities, contributing to the wider goals of whānau, the schools, and the iwi. Many hapū within Te Arawa have also established wānanga where parents and other whānau members can participate in learning programs that will improve their opportunities to participate on marae and in other cultural arenas. For some whānau, these wānanga have strengthened their existing knowledge of language, marae kawa, whakapapa, and tikanga. For other whānau, these wānanga importantly offer a point of entry into te ao Māori and their connectedness to their iwi. Initiatives such as these wānanga contribute to whānau wellbeing and consequently they positively impact on Māori student success.

Mana Tū: A Sense of Courage and Resilience

Successful Māori students develop positive self-efficacy, positive self-concept, resilience, and an internal locus of control to thrive in the school context and, eventually, beyond it. They tended to be aspirational, have high expectations and enjoy overall physical, emotional, and spiritual wellbeing. Whānau need to ensure their children have a healthy home environment that supports this physical, emotional, and spiritual wellbeing. Whānau members need to model practical resilience strategies – for example, work ethic, perseverance, determination, and discipline – because students looked to whānau as their “first teachers” and ultimate “motivation for success.”

Many Māori students today are being exposed to increasingly difficult home, neighborhood, and/or school environments that can significantly obstruct their path to academic success. However, successful Māori students thrive at school despite having to overcome adverse personal and contextual factors. Such students are often labeled as resilient. Resilience largely consists of two components: the presence of significant adversity and the achievement of a positive outcome despite the threat or risk (Masten and Coatsworth 1998). However, resilience can also be thought of as a continuous interaction between the individual and characteristics of his or her environment. In this sense, resilience is context dependent. Māori students who experience themselves as resilient, and are seen by their communities as resilient, are those who successfully navigate their way through adversity, each in his or her own way, and according to the strengths and resources available to the student as well as his or her whānau, community, and/or culture.

Māori students often experience some type of risk or adversity and some are still doing relatively well despite the risk(s). Māori students who were seen as successful in this study revealed a combination of personal and environmental characteristics that enabled them to stay focused in the face of educational adversity. Familial support, enhanced academic and cultural self-efficacy, and an internal locus of control helped the Māori students in this study to thrive in the school context. The concept of resilience was also closely linked to personal attributes such as determination, persistence, confidence, and focus. All of the Māori students who were interviewed demonstrated characteristics of resilience in order to overcome

adversity, and also employed a range of self-regulated learning behaviors in order to direct their own learning and achieve their goals.

Many of the students in this study stood out because of their desire to learn, their generally positive attitude towards school and their motivation to pursue a career that would improve the wellbeing of their whānau. More specifically, the majority of the students:

- Had positive self-concepts, positive academic self-efficacy, were intrinsically motivated, and did homework regularly
- Were described as being resolute and tenacious and said they were confident or were able to encourage or push themselves towards success
- Were goal-oriented and future-focused
- Saw a strong relationship between school and work and had chosen a possible career
- Had received consistent support and guidance from their whānau
- Appreciated extra academic support, both in the classroom and outside it, and valued teacher contact with their parents and teachers who took a personal interest in them as individuals
- Saw choosing “like-minded” friends as crucial to their ability to stay focused at school

The resilient Māori students in this study also had individual characteristics associated with academic success such as cognitive abilities, motivation, and self-efficacy. Although many students may possess these individual characteristics successful Māori students seem to rely on these capabilities to help them overcome adverse circumstances in their environment.

Various protective factors seemed to contribute towards the development of resilience in the Māori students in this study. The development of a strong self-belief was evident in most of the Māori students and was manifested in an understanding about who they were, what they wanted to achieve in life, and the direction they needed to take to realize their goals.

Common personal characteristics demonstrated by the Māori students, in addition to resilience, included tenacity, motivation and inner will, independence, realistic aspirations, and an appreciation of their cultural uniqueness. Protective factors also included support networks that existed within and outside of the school to develop their achievement, including peers, whānau, supportive teachers, and other encouraging adults. This support network is essential to the academic success of Māori students.

Māori students who expressed a strong connection with their Māori identity also tended to utilize their “Māoriness” as a support structure, calling on whānau and their cultural beliefs/traditions when facing adverse circumstances in the environment. Māori identity and the associated sense of connection and belonging served as a buffer to protect them from negative school and/or home difficulties.

This study also found a number of important protective factors contributed to academic engagement including whānau support, school responsiveness, and engagement in te ao Māori. In this study, the link between the school and the

Māori culture of the student, as well as strong whānau support, was shown to be two of the key components that contributed to educational resilience. Development of students' self-esteem and educational resilience is significantly linked to positive familial, cultural, and social supports.

Whānau socialization also played a vital role in empowering Māori students to function successfully in the milieu of the school culture while remaining grounded in their Māori identity and culture. This study showed that whānau need to ensure their child strengthens their resilience by providing a healthy home environment that supports the student's emotional, cultural, physical, and spiritual wellbeing. Many of the participants in this study believed that a sense of accomplishment and interconnectedness led to a state of overall wellbeing.

In order to successfully navigate their worlds, Māori students need to acquire a range of skills and qualities, most importantly a resilient character. However, it is clear from this study that a Māori student's capacity to exhibit resilience depends on more than individual and/or innate ability. Māori students learn the skills and strategies of resilience from their whānau and/or other supportive adults in their immediate worlds.

Mana Ūkaipo: A Sense of Place and Belonging

Successful Māori students sought a synergy between their school-based learning and the unique Rotorua context. They also wanted to see iwi role models of success made visible and prominent in schools. Te Arawa students wanted iwi knowledge to have some resonance with their educational activities, and expected iwi knowledge and history to occupy a position of importance in the school curriculum. They perceived iwi knowledge to be a viable platform for their future aspirations and achievement.

All participants involved in the study were keen to see iwi knowledge underpin relevant educational and recreational activities. Te Arawa icons and special features of the area such as the many lakes, Mokoia Island, geothermal landmarks such as Whakarewarewa and Ohinemutu, and forests and mountains were considered by the majority of students and whānau members as crucial to anchoring a person to their homelands and genealogy.

Such an approach as described by Penetito (2009) is often termed Place Base Learning (PBL). Penetito (2009) argues that this educational model endeavors to provide students with the answers to two essential questions: what is this place and what is our relationship to it? It essentially draws on the strongest features, characteristics, history, and personalities of the land or place where students are born, raised, and educated; thereby creating a synergy between school-based learning and the unique context of the surrounding ecology. It teaches "through" rather than "about" culture and encompasses ecological studies, biodiversity, community education and community relations, local history, and sustainable development (Barnhardt 2005).

Whānau were especially keen to ensure that their children were steeped in iwi knowledge and were informed about their environment as well as the people who

have and continue to influence the changing natural and social landscape of the area. Being familiar with their ancestors and understanding the history over time helps anchor a person to the land, the water, and the sky and develops in them a sensitive awareness of those who they descend from and the potential they hold for the future. The development of a strong cultural identity and affiliation to a place where their ancestors stood was described as security against adversity.

Whānau strongly believed that being possessed of the knowledge of the land, the people, and te reo was a strong foundation upon which to acquire other knowledge, other language, and other ideologies. Advocates of PBL, such as Kawagley and Barnhardt (1999), Penetito (2009), and Kidman et al. (2011), believe such a framework can help alleviate the tension that currently exists between Western education pedagogies and holistic indigenous education models. These authors also assert that PBL can move the curriculum towards a new and exciting place where ownership by students over characteristics and features of classroom-based learning can be given heightened relevance. It should provide new meanings to enquiry and knowledge that draws upon local examples. All participants agreed that PBL was the key to strengthening the relationship between students and their local area. It was also seen as a fundamental tool by which the relationship between Māori and non-Māori people could be enhanced creating greater synergy between all who live in the Rotorua area and beyond.

Whānau who were particularly passionate about the need for their child to identify first as Te Arawa, and then secondly as a citizen of Aotearoa, New Zealand, saw PBL as an approach that enriched and supported their efforts and endeavors to raise a child who was confident, secure, and resilient no matter where they went or settled in the world. Many Māori teachers across a broad range of subjects reported using elements of mātauranga Māori and/or Te Arawatanga in almost all of their classroom activities and school-based curriculum. Students and whānau were supportive of this practice as it helped elevate Māori knowledge to a central position of consideration.

All participants in this study supported the view that iwi role models of success, either living or dead, should be used prominently in local schools as a strategy to promote aspiration, cultural pride, and achievement. Students with a strong identity and historical link to iconic features and people of the land are best placed to draw on this relationship and to emulate the successes of those icons. By isolating the characteristics as representative of success, students were more likely to value PBL, and to use this as emotional leverage towards developing resilience, strengthening their cultural distinctiveness, building upon shared learning, and ultimately achieving a collaborative story of success.

Mana Tangatarua: Navigating Success in Many Worlds

Academic success should not come at the expense of Māori identity – all Ka Awatea participants saw both identities as vital to overall success. However, students need the appropriate “navigational skills” and “role models” and a strong sense of

emotional and spiritual wellbeing to navigate the two (or more) worlds of Aotearoa successfully. Ka Awatea participants indicated that supportive and galvanic relationships were essential to success. Families were primarily responsible for “success as Māori” and often modeled what this should look like. Schools contributed largely to Māori students’ “success in the non-Māori or ‘generalist’ world” because they offered students many opportunities to be innovative and creative, to try new things, to go new places, and to take risks (which many Māori families could not offer them). Therefore, schools were seen to offer students new experiences that “unleashed their potential” to bridge multiple worlds and increase their “range of opportunities” in terms of “possible futures” (Macfarlane et al. 2014, p. 175)

While academic achievement was considered a crucial measure for potential future success, it was considered to be only one feature of a Māori student’s emerging distinctiveness and evolving suite of skills. According to all of the students in this study, their Māori identity lay at the heart of all things important and their educational attainment was considered complimentary to this. Together these two constructs, Māori identity and academic identity, were viewed as fundamental to their personal growth, transformation, and journey from one developmental stage to the next – and from one world to the other. Academic success and cultural fluency were viewed by all participants as requiring a nurturing whānau, a responsive school community and a learning environment which includes the provision of educational and cultural experiences beyond the classroom. As seemingly different as two (or more) worlds can be, the ability to successfully traverse them was dependent on the acquisition of navigational skills such as: the demonstration of determination and motivation, diligence and forbearance; a healthy self-esteem; resilience; and a strong moral compass.

Te Arawa Icons: Footprints of the Past to Inform the Present

How might Māori students be better equipped to thrive personally, culturally, and educationally in today’s diverse world? When the Ka Awatea study looked to the past and recounted some of the deeds of historical Te Arawa icons and ancestors, we were able to see that they were exemplars for those of us who are engaged in the pursuit of success in today’s world. It was evident that our iwi knowledge systems held powerful narratives about the past, present, and future – prioritizing distinct languages, worldviews, teachings, and technologies that have been developed and sustained by generations of iwi members. These narratives emphasized the innovative deeds, qualities, and achievements of ancestors and reinforced the notion that these Māori students descended from a long lineage of scholars, scientists, philosophers, and the like.

The Ka Awatea study used a widely known iwi metaphor “Ngā pumanawa e waru – the eight beating hearts of Te Arawa” and transposed the beating hearts metaphor into the qualities demonstrated by the same number of historical iwi leaders/icons. These icons were nominated as role models by participants in the study. Reflection on outstanding Te Arawa leaders and what underpinned their greatness led to an

analysis of the key values, qualities, and characteristics that shaped their leadership. These qualities were then examined in light of the Ka Awatea participant data to examine whether they persisted and endured in successful Māori students in today's world. The purpose of this task was not to reify traditional notions of success and leadership, but rather to better understand how these qualities might, or might not, manifest in contemporary times. Eight common central qualities were identified (and are listed below) and were linked with the same number of Te Arawa leaders selected from across varied eras of iwi history (there were, of course, other historical and contemporary iwi leaders too numerous to be included here). The researchers found that the application of the following eight key qualities enabled the Māori students in the Ka Awatea study to thrive in education and make outstanding contributions to the society of their era – much like their ancestors did. Recounting the past in this project showed us that personal, cultural, and educational success can be derived from a combination of enduring iwi qualities including: identity, tenacity, relationships, innovation, wellbeing, scholarship, humility, and core values (see Table 1).

By linking back to the past and recounting some of the deeds of Te Arawa icons and/or tūpuna (ancestors), we were able to see that by way of their respective and collective qualities, they offered guiding examples to those engaged in the pursuit of success in the modern world. They pointed not only to how these leading figures made outstanding contributions to the social fabric of their time, but also how they continue to guide Māori students who seek to enjoy and achieve educational success as Māori today. The Ka Awatea study affirmed the importance of distinct iwi groups sustaining their unique worldviews and associated knowledge systems across millennia. This study illustrates that many core values, beliefs, and practices associated with those worldviews have “an adaptive integrity that is as valid today as in the past” (Kawagley and Barnhardt 1999, p. 1).

Iwi-Led Educational Transformation: Te Rangihakahaka and Matakōkiri

The school-community research suggests that when schools cultivate authentic connections with parents, community-based organizations, and other local partners, they can improve their ability to serve indigenous students (Austin 2005; Hall et al. 2015; Miller et al. 2013). In addition, it is increasingly viewed as “common sense” that schools involve their communities in some form of engagement (Anderson 1998, p. 572). The Ka Awatea research findings contribute to the research by emphasizing a different kind of engagement – one where the iwi itself led the charge for school collaboration and transformation.

Shortly after the findings of the Ka Awatea project were shared with the Te Arawa community via a series of presentations and hui (formal meetings), two distinct iwi-led initiatives were launched by a leading iwi educational provider in Rotorua – Te Taumata o Ngāti Whakaue Iho Ake – an iwi-led organization committed to strengthening and empowering whānau through leadership in education, health, identity, language, and culture. The two programs were called Te Rangihakahaka

Table 1 The eight qualities of successful Te Arawa students: Ngā Pūmanawa e Waru

Quality	Indigenous icon	Characteristics – successful Te Arawa students	Application to schoolwork
Identity	Tamatekapua – the commander of the Te Arawa waka, renowned scientist, and celestial navigator	Have a positive sense of Māori identity, a belief in and knowledge of self; strength of character, strength of personality; a strong will; boldness and a tendency to take risks	Positive self-concept Resilient to negative stereotypes Some language knowledge and cultural efficacy
Tenacity	Reverend Frederick Bennett – the first Māori bishop in New Zealand's history	Are diligent and have an internal locus of control, are patient, committed to learning, can overcome difficulties, and maintain a resolute confidence	Disciplined Self-motivated Attentive Focused
Relationship focused	Te Ao Kapurangi – a woman of mana, known for her cunning, fortitude, networks, and courage	Establishes, nurtures, and maintains strong peer, whānau, and teacher relationships premised on manaakitanga	Encouraging Willing to learn from mentor and others Aware of own strengths and weaknesses
Innovation	Ihenga – an intrepid explorer known for his extensive travels around Aotearoa	Are curious and innovative, have an enquiring mind, and an exploratory orientation that is exploited in social and academic activities	Creative Courageous Competitive Curious
Wellbeing	Dorothy Huhana Mihinui – a health and education advocate	Pays attention to their overall wellbeing – including physical, spiritual, and mental health needs	Fit Healthy Resourceful Balanced
Scholarship	Makereti Papakura – a scholar, the first Māori woman to attain a Master's degree from Oxford University	Is committed to advancing their own knowledge, has an aptitude for things scholarly and a commitment to excellence. Displays an intrinsic desire to learn and an innate curiosity	Can apply themselves Driven Purposeful Aspirational
Humility	Te Hiko o te Rangi Hohepa – a tohunga (high priest) and whakapapa specialist	Understands the important role of humility, service to others, and generosity of spirit	Puts others before self Accepts criticism Team player

(continued)

Table 1 (continued)

Quality	Indigenous icon	Characteristics – successful Te Arawa students	Application to schoolwork
Core Māori values	Wihapi Winiata – a paramount chief of Te Arawa loved by many and multiply skilled	Understands the role and purpose of key Māori values portrayed by way of unbridled care, inclusion, a keen moral compass and sense of social justice, and spirituality	Honors others Displays mana Connected Respectful

(Aspiring to Lofty Heights) and Matakōkiri (Light up the Sky). The programs are named after well-known Te Arawa aphorisms and all of Te Taumata o Ngāti Whakaue Iho Ake's associated school materials cite the findings of the Ka Awatea project as critical to the development of their programs.

Te Rangihakahaka is an iwi-driven professional development initiative underpinned by the history and whakapapa of Ngāti Whakaue (one of eight Te Arawa iwi). The program is designed to ensure that all Rotorua schools, community, whānau, and students have a strong knowledge base of Ngāti Whakaue (Ngāti Whakaue's distinct worldview), that all learners understand what it means to be Ngāti Whakaue, and that teachers and leaders see Ngāti Whakaue as integral to all teaching and learning. To this end, Te Rangihakahaka has four core objectives:

1. To deepen teachers' knowledge of Ngāti Whakaue identity, language, and culture through engaging in korero (discussion) about whakapapa (genealogy), tikanga (protocols), and whenua (land)
2. To develop resources that best support teachers in the teaching and learning of Ngāti Whakaue
3. To identify strategies and approaches for involving whānau and the local community in education
4. To contribute to the development of a learning framework that reflects Ngāti Whakaue and aligns to the learning expectations of (all) Rotorua schools

Te Taumata o Ngāti Whakaue Iho Ake have stated that the Ka Awatea research forms part of the theoretical framework for the program – particularly the importance of successful Te Arawa students developing cultural flexibility, resilience and leadership, core Māori values, academic self-efficacy, and motivation. The documentation also cites Ka Awatea in that they aspire for Te Arawa students to be goal driven and self-managing (Te Taumata o Ngāti Whakaue Iho Ake 2017). The full program is delivered to teachers via three full-day wānanga (seminars). Over 3 years, Te Rangihakahaka has seen an increase in the numbers of teachers and other educators participating in the program; from 50 participants in 2014 to 342 participants in 2016. In total, 595 educators from Rotorua schools have participated in the Te Rangihakahaka program in the last 3.5 years. The iwi cites a number of positive outcomes from the Te Rangihakahaka program including: one school receiving a

new Māori name, one school renaming all of their house groups after the six Koromatua (chiefs) of Ngāti Whakaue, most schools implementing elements of Te Rangihakahaka into their arts, reading, writing, social studies and science programs, and many more invitations from schools for Ngāti Whakaue to either advise or be active participants in school curriculum design and teacher professional development.

The Matakōkiri program is a school holiday science program developed by the iwi for Māori students and their whānau. The program provides opportunities for the participants to experience science and innovation that is grounded in place-based learning and iwi knowledge. Te Taumata o Ngāti Whakaue Iho Ake have completed eleven science-focused week-long wānanga with attendance rates between 95% and 100%. They have implemented the program with a total of 492 Maori students, over 240 whānau members, and have collaborated with over 100 science and technology experts and professional organizations (Te Taumata o Ngāti Whakaue Iho Ake 2017). The Matakōkiri program has five key principles:

1. Each wānanga (program of learning) is based on Ngāti Whakaue narratives.
2. Each wānanga uses local iwi experts as well as local scientists.
3. It is compulsory for whānau to attend the program with their child.
4. The science is contextualized and relevant.
5. The science is hands-on.

The Te Rangihakahaka and Matakōkiri programs have prioritized an education that links Māori students learning to the physical and cultural environment in which students and schools are situated. These place-based educational practices and programs have integrated scientific, historical, and cultural knowledge associated with local environments as a critical ingredient for developing what Cajete (2000) terms an interdisciplinary pedagogy of place. The ways of constructing, organizing, using, and communicating knowledge that has been practiced by Te Arawa for centuries has come to be recognized as a form of science with its own integrity and validity. By giving emphasis to the integrity of iwi cultural knowledge and skills, Te Arawa have utilized the findings of the Ka Awatea project and engaged in an act of reclamation, remediation, and renaissance, whereby notions of *mana tangata* have been iwi determined.

Mana Tangata: Celebrating the Proud Histories, Tenacious Present, and Promising Futures of Māori Students

While the development of a strong Māori identity is largely dependent on an individual, whānau or iwi, it is crucial for schools, teachers, and other educators to recognize, acknowledge, and support the process. The acquisition of positive Māori identity is fundamental to a student's potential for success because it can act as a protective factor when Māori students are confronted with deficit messages about their academic potential (Webber 2008, 2012). The educative process must include

strategies that strengthen Māori students' ethnic identity, cultural connections, cultural competence, and iwi continuity and all members of their community can play a role in supporting, shaping, and preparing a student to this end.

Māori students must learn to accommodate and manage the tensions and conflict that arise from different worldviews (cultural and academic). They must also learn how to navigate successful pathways that enable them to remain firmly anchored to their cultural roots and belief systems, while at the same time experiencing the freedom to navigate the broader context of their expanding worlds. Many of the students in the Ka Awatea study identified strong role models, humility, and emotional, physical, and spiritual wellbeing as critical to their educational success.

Success was considered a collective responsibility in their families, rather than a singular pursuit, and students were encouraged to observe and draw upon the inspiration of others to support their own developing aspirations. Role models were considered by all participants in this study to be an extremely influential feature of students' school, home, and community lives. Exposure to local mentors, ancestral stories, and role models, who were known for and/or demonstrated particular characteristics of success, were considered by all of the participants to be immensely helpful to student motivation for learning. The Māori students themselves were highly influenced by people they interacted with in their daily lives – their immediate and extended family members, their teachers, and members of the wider community.

Effective role models were perceived to offer helpful advice including early career guidance and information about travel and cultural experiences outside of their local context. Seeing and/or hearing about the world and/or travel experiences were considered by the participants to be part of the necessary grounding or foundation upon which success is built. Access to these experiences was seen to prepare the Māori students for the development of global citizenship and future employment. According to Wyn (2007, 2009), indigenous students need these kinds of experiences in order to develop skills to navigate a way forward in an increasingly diverse world. It is also critical for them to manage the values and expectations of the competing cultures they find themselves in. To overcome adversity and the constant threat of negative academic stereotypes, Māori students need their home, school, and community contexts to actively engage in helping them to develop positive Māori identities and *mana tangata*.

As a concept *mana tangata* implies that the strength of a person or collective is drawn from the depth and breadth of their social relationships. According to Tomlins-Jahnke (2011, p. 1), the “philosophies that underpin the concept of *mana tangata* are long-standing and reinforced in customary traditions, socially founded values, ideals and norms.” However, as stipulated by Roskrug (2011), the concept of *mana tangata* is not rooted solely in the past but also reflects our relationship to the current world and to new generations with quite different expectations. Roskrug states:

These new generations live in various parts of the world, among many cultures and ideologies, and as such they seek ways of providing for those around them from a myriad of resources. . . To this new generation of young Māori, *mana tangata* will be an expression of personal identity and uniqueness. (p. 256)

In Ka Awatea, mana tangata was related to a Māori student's ability to engage meaningfully and successfully in the school context, as well as to make profound connections with Māori culture, peoples, and contexts. Māori students in the Ka Awatea study exhibited mana tangata as a developing sense of cultural connectedness, academic and social self-efficacy, and leadership. Overall, mana tangata was related to the contribution of an individual to the community and the wellbeing of the collective.

Conclusion

Commenting on the social conditions necessary for positive Māori identity development, Durie (2003) has noted that “Cultural identity depends not only on access to culture and heritage but also on the opportunity for cultural expression and cultural endorsement within society's institutions” (p. 68). The engagement of Te Taumata o Ngāti Whakauae Iho Ake with schools across Rotorua illustrates the ways schools might work alongside iwi to ensure Māori students' cultural engagement and identities are enriched by their experiences at school. Māori student engagement and success needs to be an integrated, community-wide responsibility rather than the responsibility of one or two teachers who “go the extra mile.” Durie (2001) has also emphasized the role of schools in affirming Māori students' identities by asserting that if formal education does little to help prepare Māori students to interact within their own communities, then no matter what has been learned their education would have been incomplete. Like Penetito (2010), the findings of Ka Awatea show that there are two main ways that schools can help Māori students to thrive: “firstly if it holds up a mirror to them and they can see themselves growing and developing in a way that is personally meaningful for them; and secondly, if it helps them to project themselves into the immediate world around them as well as into the world at large” (p. 35). The findings of the Ka Awatea project indicate that when whānau, iwi, and the wider community are invested in education, positive school behaviors and a Māori student commitment to school completion and success improves. Whānau play the most important role in terms of socializing their children into the Māori world and helping them to develop cultural efficacy and healthy and supportive whānau connections are fundamental to positive Māori identity development and for promoting educational advancement. The most important developmental asset a parent can imbue in their children is to ensure that they are aware of their mana tangata – their unique leadership potential, collective belonging, cultural connectedness, and responsibilities to others.

Abstract

This chapter addresses the strategies for decolonizing, transforming, and creating meaningful spaces for Indigenous Peoples within the structures and practices of the academy and the principal institutions through which the academy works.

It draws on insights and kaupapa Māori understandings of the academy and the work to transform these contradictory and challenging spaces. We argue for decolonizing the academy and developing a theory of transformation to conceptualize, initiate, and implement multilayered change. Ultimately, the chapter sees the academy as a space of possibility because it has a powerful role in the control over knowledge. We conclude with a framework and some strategies for thinking about and implementing a model of change.

Keywords

Decolonizing · Transforming · Indigenous theory · Kaupapa Māori

Preamble

Many years ago, at a First Nations Language Conference in Squamish Territory, British Columbia, we listened to an elder describe his spiritual and cultural responsibilities as just going about doing his everyday work. He shared the thought that we, as Indigenous people, all needed to work harder and apply ourselves more seriously. Such work, in his view, was not simply about practicing our cultural ways of being; he stressed the point that our Indigenous integrity and futures are inextricably linked to the work of protecting the survival of our languages, knowledge, and culture.

It is with this idea in mind that we use the term, Indigenous work, to somehow capture the challenges and responsibilities of decolonizing and transforming the academy. Our concept of Indigenous work is that it involves praxis, an integration of Indigenous theory, action, and reflexing. This form of work should be regarded as an honorable responsibility, rather than a burden. It is work of, about, for, and with Indigenous Peoples, communities, and families. The elder's challenge to us and our colleagues was to get on with it. We bring to the chapter a distillation of insights gained through our careers in education working across different institutional and jurisdictional contexts as educationists, as teachers and researchers, as high level administrators, and as academic leaders. We have had parallel careers working in different institutional contexts to make space for Indigenous aspirations, ways of knowing, and being. We have been grounded in, and learned from, political struggles in our own Indigenous community context, especially around the recognition of the Treaty of Waitangi and the establishment of alternative schooling based on Māori philosophies, curricula, and pedagogies. These practical experiences have informed our broader work, the ways we understand the challenges, and how we can respond with innovative and transforming strategies that create new or different possibilities, spaces, and opportunities both within and outside the academy.

Introduction

This chapter addresses the potential of creating critical and meaningful spaces for Indigenous Peoples within the structures and practices of the academy and the principal agencies through which the academy works. These sites of higher

education, public and private, mostly universities, degree granting entities, and research agencies often reflect and reproduce the existing societal relations of dominance and subordination by legitimatizing themselves through mechanisms such as the control over what counts as important knowledge. This social, economic, and cultural control is in turn supported by hegemonic claims to universality of knowledge, the building of knowledge hierarchies, and by operating culturally bound institutional practices. What is often overlooked is that the colonial academy is deeply implicated in both historical and contemporary practices that have systematically excluded and undermined the presence and the validity of Indigenous Peoples, their knowledge, culture, and values. In this contemporary, ostensibly more “enlightened” and “informed” age, colonization has not gone away, it has simply changed shape and is coming at us in new formations (Smith, G. 2009). More recently, we have seen an emerging trend in the diminishment of education as a public good responsibility. Institutions of higher education have become politically captured and narrowed as instruments of state ideologies and politically motivated forms of selected knowledge, and institutions reformed to be more privatized, neoliberal corporate entities (Giroux 2002). Critical flash-points have opened up within the neo-liberal university that are of deep concern for Indigenous engagement in higher education. Some of these flash-points surface in issues related to the rise in managerialism, the commodification of knowledge, the rise of techno-rationalism, selected forms of public accountability, and within level-playing field gate-keeping policies and practices (Ball 2012). At the same time, new opportunities for Indigenous engagement, reconciliation, and indigenization have also emerged within the Neoliberal academy (Durie 2009). In summary, the Academy and the institutions through which the Academy exists is a contradictory site in that it has enormous potential to facilitate the positive transformation of Indigenous life and aspirations, equally it can also be a major influence in the continued colonization and oppression of Indigenous Peoples, their knowledge, language, and culture.

The chapter acknowledges the need to struggle for the transforming potential that resides in all institutions and the need to “make more authentic space” for Indigenous development and advancement at the highest levels of education. We think that it is important to address the critical question of what is to be done, given the continuing masking and marginalization of Indigenous access, participation, retention, success, and transforming outcomes that are experienced across different Indigenous jurisdictions. To hold our “public” education institutions to account in respect of serving all their constituents more equitably and fairly, we argue the need to critically interrogate academic institutions at two levels: firstly, the academy as a broader institution of knowledge (Said 1978) and secondly, the academy as a single institution, located on lands that have histories that are context specific.

In the New Zealand context, we have come to understand the overlapping strategies of institutional transformation inside a broader theory of change that we refer to as “Kaupapa Māori.” The need for Māori and other Indigenous Peoples to develop their own theories of transformative action is critical, the importance of which Paulo Freire noted within the following comment

This work deals with a very obvious truth: just as the oppressor, in order to oppress, needs a theory of oppressive action, so the oppressed, in order to become free, also need a theory of action. Freire 1972:150

While we draw on “Kaupapa Māori” as a theory of transforming praxis that serves the Māori context, the implications of this “idea” potentially have a wider resonance, for other jurisdictions building their own Indigenous theories and strategies of transforming (Brayboy 2014; Rigney 2017; Tuck 2009). We argue that Kaupapa Māori has not just critically and more accurately problematized the Academy from an Indigenous Māori perspective, but that it has also enabled the development of innovative and positive strategies to make space within institutions and across education systems and in turn to enable transforming outcomes that reflect Indigenous aspirations. Although we know that in some contexts, where it may have a negative connotation, we use the term “intervention,” as a deliberate and radical disruption to status quo approaches. It is important that we, as Indigenous communities, take over the responsibilities for naming, defining, and intervening in the crises, which fundamentally, are not of our making, but in which we have been situated and which have had on-going and enormous negative impacts on our language, culture, collectives, and families.

In this work, there are different catalysts for change. Faculty and staff may be one source for initiating institutional change, another source can be disaffected Indigenous communities. Another catalyst for challenge and change is often derived from Indigenous students themselves who do the important advocacy and mobilizing work that draws the attention of the institutional hierarchy to the need to address Indigenous concerns. We reiterate that it is important to have an Indigenous theory of change to underpin and give coherence to any strategies for transforming the academy. In this regard, a theory of transforming, which we discuss later in the chapter, can provide a broader agenda that moves the change from simply being a disjointed set of “one off” projects that make good public relation stories to being more institutionally coherent, sustainable, and transformative.

It is important to have a nuanced, theorized, and accurate understanding of what has gone wrong in order to develop more effective transforming responses. We begin this chapter by addressing why the academy needs to be a focus for decolonizing and transforming efforts and explores some of the complexity and competing notions at work when trying to introduce Indigenous change discourse and do meaningful Indigenous work. We conclude with some frameworks and strategies that we have found useful in our work and suggest some ways to sustain a reflexive approach that stays connected to Indigenous aspirations.

Why Does the Academy Need to Change?

It would not be an exaggeration to say that the academy, namely, institutions of higher education, have been woefully neglectful, dismissive, and hostile to the participation of Indigenous Peoples (Deloria 1988). The Academy has historically

produced scholarship that legitimated dominant hegemony about Indigenous Peoples as justification for vilifying their culture, excluding their people while often benefitting from their lands (Nakata 2007). Theories of intelligence, race, human development, eugenics, nature, and early foundations of many disciplines were formed in or from colonial ideologies (Smith, L. 1998). Many institutions were built on the confiscated and stolen lands of Indigenous nations. The Academy, including newly formed academic institutions, often claim a tradition of higher learning and advanced knowledge that is deeply steeped in colonial and imperial paradigms (Said 1978). The power of the academy lies in its symbolic self-representation of advanced, civilized, and human accomplishment. It is reinforced through its hegemonic role of (re)producing “real”/legitimate knowledge, and in its actual social and cultural relations of dominance embedded in the very systems, structures, and practices of disciplinary-based knowledge cultures and the assembling of these ideas and resources into a unique institutional force.

It would not be an exaggeration to claim that the colonial academy sits at the top of a hierarchy of a public education system that has deliberately and systematically excluded Indigenous Peoples and their interests and, moreover, continues to actively attempt to colonize them. It is also argued that many colonial educational systems designed specific schooling strategies for Indigenous Peoples that have proven to be so abusive; they have inflicted inter-generational trauma on families, students, communities, and as well as on languages and culture (Adams 1995; Report of The Indian Residential Schools Truth and Reconciliation Commission 2009; Simon and Smith 2001). What this means in the twenty-first century is a historic educational crisis that continues to have inter-generational impacts on Indigenous Peoples, nations, and communities. The crisis has a significant and negative impact in nullifying Indigenous Peoples, Nations, and communities social, cultural, and economic well-being as well as their ability to pursue their own aspirations. The right to an education is considered a fundamental Human Right and a Right for Indigenous Peoples under the United Nations Declaration of the Rights of Indigenous Peoples (Battiste 2013). The critical question however is what counts as an education and what mechanisms ensure that this “Right” can be realized.

Indigenous people are increasingly seeking to engage in higher education and aspire to see their knowledges and languages and cultural preferences available as genuine options within the academy (Behrendt et al. 2012). More recently, there have been increased calls from communities for more Indigenous control and self-determining forms of higher education provision. The motivation for this trend is that Indigenous interest groups are tired of arguing against the “mainstream” to create space in contexts of struggle over minimal resources within institutional environments. They argue that their case is not necessarily against other existing options in the academy, but that they would want space and viable options that reflect their aspirations, needs, and “rights.” Arguments about the reproduction of “inequalities,” “disparities,” “injustice,” and “unfairness” are often manifest in visible ways and form an important part of the case for appropriate inclusion in the academy. Some Indigenous communities are now seeking high level constitutional relationships, between Indigenous nations and institutions, and in the form of Memoranda

of Understanding with public institutions. They expect institutions to provide for Indigenous knowledge and language. In this regard, they are seeking more meaningful expressions of reconciliation and decolonization.

Another factor contributing to what is a cumulative cycle of Indigenous underdevelopment is that many Indigenous populations are “hidden” within developed populations of first world countries, for example, the Aborigines and Torres Strait Islanders in Australia, Māori in New Zealand, First Nations, Metis and Aborigines in Canada and Native Americans, Hawaiians, and Native Alaskans in the United States. The plight and needs of these Indigenous populations are often submerged and concealed beneath the veil of middle class and elite interests of dominant colonial populations. How they are defined by legislation designed to destroy them determines how they may even be counted in current statistics. In this sense, Indigenous aspirations, needs, and interests are likely to be deliberately obfuscated by these countries wishing to maintain their developed status and reputations within the OECD “developed countries” rankings, World Bank economic ratings, International Monetary Fund credit ratings, and World Trade Organization trading consortiums such as APEC, the Asia Pacific Economic Consortium, and an emerging array of Free Trade Agreements (Breidlid 2013; Mead and Ratuva 2006; Smith, G. 1990b).

Quite often the Indigenous populations within these countries are (mis-)categorized as “developed” by virtue of the overall country’s economic development status despite numerous reports that identify (in some instances) their “fourth world” status (Manuel 1974). Many of these Indigenous populations tend to fall outside of the immediate gaze and concern of the specific groups and funding organizations designed to assist the underdeveloped world and populations. Furthermore, the politics of these developed countries ought to be critically understood in terms of the colonizing impulses of political domestication, social control, and the reproduction of cultural dominance. In these First World countries, colonization has changed shape and is being sustained in different ways from historic colonization of past centuries. Many of these new formations can be critically linked to neo-liberal economic intentions that are developed at the intersection of economic exploitation and cultural oppression (Smith, G. 2009). Thus, from the point of view of the Indigenous populations trapped in these conditions, and who encounter a different reality, these conditions are experienced as “more of the same” outcomes, ongoing conditions that are linked to colonization, oppression, and exploitation.

In many jurisdictions, the academy has been a bastion of colonial privilege protected from having to change and be more inclusive of Indigenous Peoples by the social, cultural, economic, and political superiority of a dominant colonizing population. It is not that higher education institutions have not changed at all, but that they have barely changed, when it comes to the genuine inclusion of Indigenous Peoples aspirations and interests. Since the end of World War II, there has been some movement towards greater democratization of public universities and an opening up of wider professional and curriculum qualifications and opportunities. This gave rise to the notion of public institutions serving more of the general public rather than just elite groups. Over time there has been a retrenchment from this position because of the rise in neo-liberal economic ideology. In this shift, public institutions have

become less about a liberal education for the “public good” and more about an instrumental functionality to serve the state’s need to embed the hegemony of the neo-liberal economic vision (Ball 2012). Academic institutions have become more specialized, and many publicly funded institutions have represented themselves as serving their “privatized” interest groups or, in more corporate speak, their stakeholders and markets. In the 1970s, the feminist movement was somewhat effective in influencing institutional practices, but their success has not translated across to impact for Indigenous Peoples. The work of antisexism, gender inclusion, anti-racism, and multiculturalism are still on-going projects albeit within the framework of neoliberalism (Hale 2005). Indigenous Studies began as an academic subject during this time in some parts of the world (Hokowhitu et al. 2011). There have also been many attempts over the decades by Indigenous Peoples to enter into Universities as students and on graduating then trying to use their education to support their communities and advance Indigenous aspirations. These forays into higher education have not required the academy to change; rather, they have required Indigenous individuals to change themselves to “fit in.” “Fitting in” is a classic requirement of cultural assimilation.

Since the 1990s there have been a range of strategies employed to create more autonomous space for Indigenous Peoples and their knowledges and languages and to grow greater Indigenous intellectual capital through providing both curriculum and pedagogical spaces that fostered academic success and developed Indigenous capacity (Kirkness and Barnhart 1991; Smith, G. 1990b). The story of the development of Māori education at the University of Auckland in New Zealand is one such example, and it is where we began our own academic work. Our formal entry into the academy was as a joint appointment to one position that meant we were each half time, but it also meant there were two of us, supported by Faculty allies, to plan and strategize. From that position, we created a curriculum that was inserted into core courses as well as a specialist curriculum at advanced level. We co-wrote a foundational text with our non-Indigenous colleagues to support our teaching and set about writing and publishing as much research as possible (Jones et al. 1990; Smith, L. 1986).

We identified, recruited, and developed a strong cohort of Indigenous students to study as graduate and postgraduates. We created a group of academic staff called Te Aratiatia that included Māori academics who have gone on to have their own influential careers, such as Kuni Jenkins, Patricia Johnston, Margie Hohepa, Leonie Pihama, and allies to provide the collective and strategic platform to enact change. We identified educational theory and research as a critical Māori project and co-designed the core curriculum of the education major, and with our colleagues we developed Kaupapa Māori theories and methodologies that connected Māori positioning, aspirations, and strengths to a theory of critical institutional and social change (Smith, G. 1990b; Smith, L. 1998). We argued the case to develop Māori-focused courses which were aimed at the needs of Māori students first and foremost. Moreover, we gave support to other courses by contributing Indigenous content, but we were also clear that we did not want to be co-opted to this kind of teaching, and our participation was an “interim” measure while these staff accessed other resources

to give them support. We had considerable support from colleagues but were also very purposeful in our agenda to develop a Māori education department, graduate program, and research institute which we ultimately achieved.

Education is one of the ways in which Indigenous peoples can work themselves, politically and intellectually, out of the trauma of colonization. To believe in education as an answer is to believe that society is educable and that change is possible. It is also to believe that we, as Indigenous peoples, can educate ourselves and can think ourselves into new visions for our Peoples and Nations. As Graham (Smith, G. 1999a) has argued, the importance of education to Indigenous transformation is so crucial that we will not have a sustainable social, economic and cultural revolution in our Indigenous communities without a prior or simultaneous education and learning revolution.

Decolonizing the Neoliberal Academy

Indigenous people know from firsthand experience that the academy is not a neutral or objective site, although many academic staff genuinely believe this to be so and accept the hegemony that the academy is the home of freedom of thought and speech even though it also allows the perpetuation of racist rhetoric (Squire 2017; Thornton 2009). It is important to understand that the old liberal and the neoliberal version of the Academy are both manifestly implicated in imperialism and colonialism and the critical task of decolonizing the Academy is necessary and goes hand in hand with any efforts to create space for Indigenous Peoples and Indigenous Knowledge (Smith, L. 2018). Furthermore, we contend that colonization has not ended but continues through new formations that we need to understand and resist (Smith, G. 2009). The new formations of colonization are currently driven by conservative, neo-liberal, and moral retrenchment politics (Smith, L. 2008).

The shift to a neoliberal reframing of the academy is reinforced by moves that we have witnessed firsthand in New Zealand in the commodification of education and its development as an export commodity (Smith, L. 2007). In these circumstances, Indigenous interests are made even more vulnerable as institutions develop their international student markets (Wright and Peters 2017). As an example, qualifications and programs are marketed abroad using very generic curricula that diminishes the unique and Indigenous elements of a New Zealand curriculum. The “international” curriculum is heavily Anglo-American in the way it is framed. The Indigenous elements are reduced to providing an exotic experience, while the students study the really important official knowledge of qualifications, for example, in engineering and computer science. Professional qualifications that teach to the New Zealand context such as law and teacher education are somewhat immune from this because they are expected to practice in New Zealand. There have been some attempts to incorporate uniquely New Zealand, and some Māori, understandings in under-graduate qualifications marketed abroad and thankfully, many international students actively seek Indigenous knowledge as well as experiences.

International education has become important especially in highly developed countries where international students, often from developing countries and their former colonies, as well as emerging economic powers such as China are recruited (Dale and Robertson 2009). International education is partly an exercise in making money from education like a business, but is equally important, and has been historically important, in creating cultural hegemony, a way to influence the hearts and minds of the people who return to their own countries. It also facilitates the state withdrawing from paying for public education and passing costs down to individual students and institutions. This reconstitution of the role of education and by extension institutions generally is signaled in the catch cries of the “Knowledge Economy,” the “Knowledge University,” the “Research-led University,” and “Knowledge Enterprise” (Ball 2012). The particularities of these metamorphoses of the University as a “research informed teaching sites” into the “research-led University” are informed by an overtly economic agenda. These are further seen in a range of performative activities such as knowledge prospecting, controlling intellectual and cultural property rights, and the subsequent emphasis on research performance and productivity as major income streams for universities. It is also seen in the competitive race between universities to attract the “best and brightest” students; in the increased emphasis on innovation and patenting; in the formation of global multinational university conglomerates; in the institutional and credential hierarchies that put accent on research competencies; in the development and emphasis of university research careers as opposed to “research informed” teaching; in the graduate student emphasis that is focused on research; and in the hegemonic participation and in the public spectacle of league tables and performance indicators and university ranking systems.

The consequences of these trends (at least in NZ) are seen in the diminishment of humanities and liberal arts courses and a correlating rise in the status, funding, and support afforded science and technology courses, a corresponding rise in emphasis on the relationship between education and work exemplified in emphases on “training” and “professional” programs, the reconstruction of equity provision within a “level-playing field” ideology and the undermining of affirmative action and compensatory equity programs, the “massification” of undergraduate teaching, increased competition between institutions for the available research dollars, higher fees, and so on (Guri-Rosenblit et al. 2007). Over and above the reshaping of the University as a new “market place,” the impediments that have traditionally militated against the access, participation, retention, and success of Indigenous students remain and in some instances, have been deepened and made more complex.

Strategies for decolonizing the academy are often subverted or co-opted by other reform agenda that may seek, as examples, greater efficiencies, more innovation, or international education. They can also be subverted by the beliefs, actions, and purposeful inactions of individual colleagues, in the Faculty and in the administration, in what Tuck and Yang (2012) have referred to as “settler evasions” and “settler moves to innocence.” The unhelpful attitudes and actions of colleagues have also been referred to as “epistemologies of ignorance” (Sullivan and Tuana 2007; Jahnke 2016). Graham refers to them as a politics of distraction because these colleagues

deploy strategies and discourses that distract us from the goals we are trying to achieve that can shift the agenda towards appeasing others and forcing early compromises (Smith, G. 2009). These strategies are often deployed by colleagues some of whom may see themselves as allies setting their own parameters about what is possible and as interpreters of what “indigenous people really want.” The educational crisis that disproportionately impacts Indigenous Peoples can be co-opted as a rationale for enabling the academy to reform itself to better deploy its intellectual power and institutional resources to reinforce the privilege of existing dominant group interests. Indigenous peoples are frequently forced to argue for their place in the reform agenda and use instruments such as the UN Declaration of the Rights of Indigenous Peoples and Treaties, if they have them, to get a seat at the table or a voice into the process of reform.

In most democratic jurisdictions, the public funded education system has a public good responsibility to deliver improved outcomes for society including groups such as Indigenous Peoples, First Nations, or in our case, Māori. These and other equity rationale can be used as arguments for more dedicated resourcing, to enable some changes to curriculum, to management, to governance, and for wider system change. In general, one or two more positions for the provision of Indigenous oriented curriculum, encouraging more Indigenous teaching and research, are often surface, cosmetic changes that mask the need for more substantial change. Such change must challenge multiple sites of resistance and gate-keeping that are (re) produced by the dominant structures entrenched in the system. At a more fundamental level, the decolonizing work must begin with the academy being able to critically self-reflect on how dominant non-Indigenous interests, power, and control over selected knowledge is structurally and culturally perpetuated within the taken for granted status quo conditions (Apple 2003). In some instances, where institutions are located within large Indigenous populations, institutions may need to redefine their identity, their very sense of being, their relationships to the lands on which the institution is situated, and with the peoples whose lives have been, and continue to be colonized by Western dominant cultural systems and intellectual traditions. In this sense, the academy might be likened to a “Trojan horse” with hidden dangers for Indigenous Peoples (Smith, L. 1986).

There is urgency in overthrowing the existing circumstances of marginal access, participation, retention, and success by bringing more focus on transformative outcomes and more evidence of its impact on the well-being and flourishing of Indigenous and other socially excluded communities and wider society. Getting more meaningful change requires careful monitoring of the propensity of institutions to reproduce existing inequalities. Such attention may require structural change that engages at the level of economics, ideology and power. The issue of “transforming” itself needs to be addressed specifically and urgently, particularly around the following types of critical questions.

- What counts as transforming outcomes?
- Transforming in whose interests?
- What is meaningful transforming?
- How do we know when we have real transforming?

- Whose responsibility?
- Who is accountable?

A key development in the New Zealand context has been a move, by the Government to pay more attention to the issue of transforming outcomes of education and to hold institutions more accountable for their results. This contrasts with most equality of opportunity approaches that focus on the opportunity to gain access and to participate with little or no accountability on institutions to ensure success (Bowen et al. 2009).

Indigenous Work Is More than Equality of Opportunity

Indigenous work, however, is more than just a broadening of equality of opportunity strategies to be more inclusive of Indigenous people. In the context of the academy, Indigenous work refers to the agenda, strategies, tactics, policies, relationship building, actions, and programs designed and implemented to improve access, expand visibility and participation, improve outcomes, and reflect Indigenous cultural, linguistic, historical understandings, and strengths inside academic institutions. It is work that engages horizontal and vertical institutional transformations, building both Indigenous and institutional capability and securing the full participation and engagement of Indigenous Peoples, their nations, and communities, ensuring successful outcomes for Indigenous students and the inclusion of teaching and research of Indigenous knowledge/s, languages, and cultures. It is also work conducted at the interface of institution, community, and society. Indigenous work is inherently political and is overtly pro-Indigenous. This is because it is focused on changing the status quo and challenging unequal social and power relations between dominant non-Indigenous interests and subordinated Indigenous interests. Indigenous work raises critical questions about how power and control are mediated and given effect by State, institutional, and public structures and practices. It seeks to expose how power works to exclude and include in explicit, complicit, and implicit ways. Indigenous work in the academy is an important part of the process of decolonization because the academy plays such a significant role in the production and legitimation of knowledge.

Indigenous work is often framed by institutions and public policy within the broader agenda of equal opportunities and social equity that, for example, might include gender, disabilities, race, ethnic and religious minorities, nonspeakers of the dominant language, or groups that live in specified regions. Sometimes it is homogenized under the title of “affirmative action,” a term which is dominated by the public policies and legal frameworks of the United States (Bowen et al. 1998). Generic labels can translate into practices that further the marginalization of marginalized groups and reinforce the privilege of the dominant group. This approach is often manifested in practices such as a singular administrative champion with no influence on academic decisions, staff from diverse, mostly black or brown, diversity groups all being on a committee chaired by either a white man or white

woman, a hierarchy of competing interests managed and refereed by a mid-level official, a high level official with minimal resource support trying to make a difference for multiple groups, and as institutional rhetoric that constantly emphasizes the need for students to try harder to “fit in” and be “the same” when it is clear they cannot fit in or be the same.

Common Objectives in Equality of Opportunity Programs

There are different definitions of equality of educational opportunity and equity and therefore different approaches to addressing issues inside institutions (Bowen et al. 1998; Dworkin 2002). Equality of opportunity programs is variously defined, depending on jurisdiction and context, as ones that seek to;

- Remove barriers that exclude and discriminate against designated groups
- Ensure fairness and equality of opportunity
- Ensure equal access to the University for disadvantaged groups
- Address social disadvantage
- Focus on and attempt to bridge the gaps in access, achievement, and participation by using the dominant population as the norm or standard
- Ensure equitable treatment of individuals regardless of gender, race, disability, sexual orientation, age, and religion
- Provide targeted tutorial and support systems for students
- Meet human rights and other legislative obligations
- Address under-representation of designated groups

There are many different approaches to meeting these aims; some are much more active than others. These approaches are often manifested in particular types of programs, such as ones aimed at preparing students for academic study, providing extra tutorial support, building strong pastoral support programs, providing staff with professional development opportunities, and helping students become successful in the system (Craven and Mooney 2013). Level playing field approaches tend to focus on “trying harder” to attract participants from designated groups, removing obvious barriers to access and practicing more transparent processes of “fairness.” More active approaches try to incorporate diversity into their systems so that people from designated groups can engage and participate fully without losing their identities and having to conform to a dominant cultural view of what is normative. Many equity frameworks are defined by legislative requirements and policies that identify specific designated groups. Most designated groups are also designated as “minorities” or ethnic minorities except for women.

Here we are focusing more on the challenges of doing Indigenous work rather than on covering the broad spectrum of work in the multiculturalism, diversity, or inclusion arena. There is naturally some overlap and intersection with these other equity approaches; however, there are quite different historical contexts, visions, moral arguments, cultural values, and practices that differentiate Indigenous work

from other kinds of equity work (Brayboy 2014; Rigney 2017). It is the kind of work that requires a special kind of Indigenous leadership (Katene 2015; Kenny and Fraser 2012). In the Indigenous area there are, by definition, different constitutional, governance, legislative, or historical frameworks and imperatives that are drivers of policy and institutional change (Durie 2009). In New Zealand, for example, the Treaty of Waitangi 1840 between Māori and the British Crown has framed relationships, expectations, and protocols for working together, which impact on Indigenous work in significant ways. The “Treaty” relationship, for example, is sometimes reflected in governance arrangements with Māori representation, and in support for Māori language and culture that is backed up by other legislative and policy frameworks (Hutchings and Lee-Morgan 2016). Māori people are also citizens of New Zealand and have rights as individuals to participate fully in society and to receive the full benefits of society.

Potential Objectives in an Indigenous Work Program

In addition to the points made in relation to equality of opportunity objectives, Indigenous work seeks different kinds of recognition, relationships, and outcomes. Indigenous work may also engage in the following objectives:

- Addressing constitutional and governance relationships between Indigenous Nations and the Nation State
- Implementing Treaty obligations, where there are Treaties, and formalizing agreements between nations and the institution
- Responding to a reconciliation agenda
- Being informed by, and including, Indigenous language, knowledge, and culture in core curriculum and research as well as in official documents, ceremonies, and signage
- Removing anti-Indigenous references, statues, mascots, and other symbols of racism and colonialism that are literally written into the bricks and mortar of an institution
- Recognizing the land and place as an Indigenous Territory and as having an Indigenous history
- Forming and honoring relationships with Indigenous Nations and communities. This may also involve an Apology for past actions or inactions
- Supporting Indigenous community and nation building development efforts and contributing to Indigenous capacity
- Having dedicated spaces and holding events that support Indigenous identities, build community for Indigenous students, and welcome the participation of elders and community people
- Including Indigenous concepts and stories in architectural design, landscaping, academic ceremonies, and university signage

An example that may illustrate the difference between an equality of opportunity approach and an Indigenous approach is from an institution situated on Indigenous

lands that are mostly desert, with a bloody history of conquest and Indigenous removal that has created a built environment reflecting a very European notion of a university. The lawns are watered and the gardens are designed to reflect a philosophy of human control over nature and planted with introduced species that require regular watering. An Indigenous garden seems not only to be a great idea but one that would be sustainable in the desert conditions. At a common-sense level, it seems like a great initiative, but Indigenous initiatives are not always viewed as “common sense.” The Indigenous garden which would once have been the entire environment prior to colonization is seen almost as a concession. It does not fit the landscaping, but the garden is eventually agreed to, named and becomes a source of pride for everyone. As an initiative of equality of opportunity, it works and the institution feels good and it has not ruined the manicured and well-watered gardens that dominate the campus. This initiative says that Indigenous landscapes, plants and gardens, have been given an opportunity to be revitalized but with permission and within defined parameters so as not but to upset the dominant design of the campus gardens, that is, the status quo. An approach, from an Indigenous perspective, might be, firstly, to conduct ceremonies to heal the land and let the land speak again. This may be followed by letting the natural environment re-emerge and by re-establishing relationships between Indigenous people, the community, and the land. That may be followed by discussions and consultations on how best to take care of the landscapes and gardens in ways that nourish the peoples’ well-being. The restorative process could also co-create and name a special “European Garden” that requires watering, somewhere on campus.

Theorizing Transforming Approaches to Change

Recently, Māori have developed some distinctive transformative strategies to various crises that they have faced (Smith, G. 1999a, 2009, 2015). Of interest has been the implementation of a range of innovative strategies for the re-development of Indigenous/Māori education and schooling in New Zealand. Given the depth and breadth of the changes that have occurred at all levels in the education and schooling of Māori in New Zealand, it may be of potential benefit to inform other Indigenous situations. A central focus of Māori (and acknowledging that every Indigenous context has its own individual nuances) has been a deliberate emphasis on shifting away from being reactive to what the dominant non-Māori population think, want, and propose for them, to being more assertive about what they themselves want. In this sense, Māori have become more proactive and engaged in making decisions and changes for themselves. In this way, Māori have moved to initiate, for themselves, the necessary actions to begin transforming themselves rather than inheriting initiatives for change based on other peoples’ decisions and thinking. In seeking to exercise greater control over their own lives (and subsequently more self-determination in their thinking and actions), Māori have become more interested in the academy and the place of theory, drawing on Indigenous knowledge as

well as disciplinary-based knowledge, and have theorized their own Indigenous transformation.

Māori have challenged the social and cultural construction of the academy and the central role of theory in perpetuating the status quo of Eurocentric dominance and Indigenous marginal positioning (Pihama 2015). Māori resistance has emerged on two fronts. They have systematically and critically challenged the colonial construction of the academy, and they have proactively advanced the case for the validity and legitimacy of Māori/Indigenous knowledge, language, culture, curriculum, scholarship, staffing, and theory among many sites of struggle (Penetito 2010; Walker 1999).

A key part of the general struggle over theory has been the need for Māori to theorize their own experiences, histories, and efforts at transformation (Penetito 2010; Pihama 2015; Smith, G. 1990b; Smith, L. 1999b). This has informed much of the work we have been engaged in and through education. There is a continuing need to develop transforming ideas that are portable and can be applied across many sites, that are tested through practice and enactment, that are critically informed and responsive, and that are ultimately transforming of our conditions of social, cultural, and economic underdevelopment. This work related to theory building is also important in legitimating our own spaces within the academy – to create and build our own knowledge spaces connected to our own Indigenous theorizing (Henry and Pene 2001; Smith, L. 1998; Pihama 2015). This advance by Māori into theorizing is beginning to produce a more coherent and methodical approach to intervening in educational crises. It has also produced a set of intervention elements (Smith, G. 2009) that are now being successfully applied to develop change within and outside of education. These intervention elements, also referred to as principles of praxis, are

- The principle of self-determination or relative autonomy
- The principle of validating and legitimating cultural aspirations and identity
- The principle of incorporating culturally preferred pedagogy
- The principle of mediating socioeconomic and family difficulties
- The principle of incorporating cultural structures which emphasize the collective rather than the individual
- The principle of shared and collective vision/philosophy (Smith, G. 2009:25–26)

We see five discernible and important outcomes of this new “change” context.

First, it has centralized the need to focus on decolonization and transformation, of society and education systems in particular, as key structural issues (Hutchings and Lee-Morgan 2016). This is based on the reality that for most Māori the status quo of policy intervention being developed from the outside, over the top of Māori, has had minimal positive impact with respect to making the necessary changes. Transforming society has several elements within it that include constitutional, governance, policy, curriculum, and pedagogical interventions. This focus also requires the state to develop the capacity to work with Māori, to engage, partner, co-design, and mature alongside Māori communities.

Second, there has been a need to build our own intellectual capacity and capabilities of scholars and community workers connected to Indigenous communities who can act as critical agents of change and advocacy (Smith, L. 2018). Our Indigenous strength is in our ability to mobilize our cultural ways of collectively organizing and supporting a larger vision for our communities and Peoples rather than as competitive individuals, engaging in privatized acts of academic achievement. The new capacity for Indigenous theorizing may not just be clustered inside academic institutions or in the professions but within a broader collective network of intellectual capital that spans Indigenous communities, institutions and interest groups (Smith, L. 2018). Intellectual capacity for new theorizing is produced both organically – out of Indigenous community struggle – and formally through traditional education and learning. This enhanced networking of intellectual capacity will potentially design and create new thinking, theorizing and practices that better respond to the needs and aspirations of Indigenous communities.

Third, there is an urgency to work simultaneously in our own communities to heal intergenerational trauma and to support the self-development efforts of our own collectives (Pihama et al. 2014). Communities are facing multiple crises in health and well-being, in economic participation, and in basic survival that requires our collective effort and imagination to address. The decolonizing and transforming elements of Kaupapa Māori begin with whānau, the collective entities that need to flourish if Māori society is to flourish. Academic achievements have traditionally been a ticket to cultural assimilation. The Kaupapa Māori approach has been to prepare students to return to communities and work across a range of contexts while remaining deeply connected and committed to the advancement and development of Indigenous nationhood.

Fourth, Māori theorizing (Kaupapa Māori) has embedded within it several key transformational elements that can be potentially applied across other Indigenous contexts as a more general “theory of transformation” (Smith, G. 2017). These elements in the academic context have saliency because the academy as a set of knowledge institutions is international and draws from the same Anglo-European traditions of the university. Kaupapa Māori provides a way to position our struggles for institutional change in a wider collective struggle faced by all Indigenous Peoples. One example of this is in relation to supporting Indigenous students through their doctoral qualifications. The MAI Doctoral program which originally sought to graduate 500 Māori with PhDs has inspired similar programs in other contexts (Smith 2016). The SAGE program (Supporting Aboriginal Graduate Enhancement) in Canada and support programs in many institutions are focusing on assisting Indigenous students through their entire educational experience while at the same time creating powerful networks that will serve them throughout their lives.

Māori people have also been wary, even hostile, to some of the activities engaged in by academics, researchers, and institutions. This antagonism has often been for good reason as Māori communities have felt exploited by researchers, academics, and institutions. A further cause for resentment among some Māori resides in the continued limited access and participation in higher education particularly within universities. This has contributed to the exclusion of Māori from the important

domain related to the production and reproduction of legitimate knowledge. In general universities have been somewhat reluctant to include Indigenous knowledge in the curriculum, employ Indigenous academic staff to teach Indigenous knowledge and to systematically attending to the issues of access, participation, retention, and success of Indigenous students. Many university institutions have become well practiced in the excuses that are essentially designed to preserve the status quo access and participation in higher education.

Understanding Why Strategies and Interventions Have Failed

Many of the strategies and policies that were originally intended to make change for Indigenous contexts and that have failed to work show some common faults. It is important to learn why interventions even when based on good intentions have failed and to understand how success has often been seized from the jaws of defeat. Decades of policies and programed interventions have been constructed predominantly by non-Indigenous policy-makers who stay constrained within policy frameworks and sets of interests that are essentially hostile or in conflict with Indigenous perspectives and aspirations. These policies and interventions are often referred to as deficit-based programs that focus on fixing up perceived deficits within indigenous students, families, communities, and cultures and their entire race (Bishop and Berryman 2006). Such failure is often embedded within the hidden agenda of cultural assimilation, economic exploitation, racism, and sexism. Almost inevitably there is an underpinning assumption of the superiority of western language, knowledge, and culture. These culturally presumptuous views and practices are often embedded in “taken for granted” ways within the theories, selected curriculums, examination systems, pedagogical practices, and physical structures of the academy that in turn give authority, legitimacy, and authenticity to “what should be counted” and accepted in that society as the prevailing conventional academic wisdom and knowledge. What is problematic here is that Indigenous communities have little influence in the academy.

In the recent initiatives related to “theorizing for themselves,” Indigenous people are questioning the role of the academy and their complicity in the control over the production and reproduction of elite knowledge. What is interesting is that rather than spending inordinate amounts of time trying to convince non-Indigenous academics of the validity of Indigenous knowledge, many Indigenous Peoples are simply announcing what they are going to do, with or without dominant societal support. They are refusing to be side tracked or constrained by the politics of distraction which is exhibited in the mono-cultural, defensive views of non-Indigenous academics (Pihama and Harry 2017). In this sense, Indigenous academics are proactively assuming their own intellectual spaces in the academy – they are also building their own institutions. This marks a radical shift from the previous stances adopted by Māori of either not engaging at all or engaging hegemonically and capitulating to the prevailing norms, values, knowledge, expectations, and aspirations of the academy. What is being confronted here is the very

essence of the “taken for granted” academy that organizes around ideals of “academic freedom” and “public good” as central values and the contradiction of these ideals presented by the selected exclusion of Indigenous languages, cultures, and knowledge. The effect of maintaining the “status quo” situation of policy inertia is to maintain the existing unequal power and social relations of dominant non-Indigenous control and subordinated Indigenous domesticity. The reproduction of the “status quo,” put bluntly, is about the reproduction and maintenance of “white privilege,” power, and control. Indigenous communities must act to free themselves from the hegemonies that effectively hold these inequalities in place (Moreton-Robinson 2016).

In most countries, the ongoing and deepening crises related to the educational and schooling under-development of Indigenous students is simply not improving. So-called “mainstream” Education and schooling sites in these countries have typically tended to be dominated by “white: mono-cultural” educators and academics. Most of them are likely to have been defined, informed, and ultimately constrained by their “euro-centric” and deficit thinking which often has limited relevance in understanding and dealing with the issues confronting Indigenous students and their communities (Bishop and Berryman 2006). Typically, their aspirations for Indigenous students is to make the students look exactly like the non-Indigenous students as fast as possible. Dominant white society tends to equate outcomes of what counts as a “good education” as someone who thinks, acts, and conforms to a norm that is defined by the dominant social order. Indigenous communities are often thinking of the need for skills in “world knowledge” and skills that fit them for their “cultural existence.” Thus, for Māori, there has been a contradiction in the reproduction of white dominance (and subsequently brown marginalization) within the academy and within education more broadly (Milne 2016). This reproduction of colonization through hegemony takes a particularly abhorrent form when “white” thinking is reproduced within and through “Indigenous” individuals and groups (Moreton-Robinson 2016). This speaks to the reality of assimilation, colonization, and oppression faced by many Indigenous students who are trapped in a mono-cultural, white dominated education system and need indigenous tools to make sense of their experiences (Brayboy et al. 2014).

The line of argument being pursued here is not against western knowledge(s), theories, and practices per se; rather, it is an argument about trying to add to the range of knowledge(s) already at our disposal within the academy (and by extension within schooling and education). That is, to develop a range of knowledge(s) and theoretical tools with which Indigenous students might more appropriately engage with their own cultural world(s). The argument here is the need to add new knowledge(s), skills, and expertise (currently missing to any great depth in most Universities) to improve the relevance and usefulness of the academy for Indigenous. The interface of Indigenous wisdom, thinking, and knowledge with other knowledge(s) also provides enormous potential for new, fresh opportunities and innovative ideas that can potentially be more effective transformation of the Indigenous crises.

Twenty Ideas to Strategize and Action a Change Agenda

We now turn to identify some ideas that Indigenous workers might find useful in creating space for enhancing Indigenous learning opportunities. We group these suggestions into four larger areas for consideration; Firstly, personal skill development, secondly, critical understanding and transforming institutional structures and practices, thirdly, building innovative and transforming initiatives, and fourthly, building community support and interface.

A. Personal Skill Development

Personal skill development is important because, and as noted elsewhere, you cannot expect to change others if you do not model and commit to the expected changes yourself. It is not enough to simply be an Indigenous person, with an Indigenous genealogy as if this work comes innately and does not require knowledge, experience, commitment, and some nuanced understandings of Indigenous and colonial history, knowledge, and cultural practices. Indigenous workers should

1. Have an overt and positive consciousness about being Indigenous and the collective responsibility (and courage) associated with this.
2. Work at developing and maintaining cultural and academic credibility with Indigenous, peers, students, and community.
3. Have a good critical, informed, and pro Indigenous overview of the institutional environment and practices. It is important to understand accurately, using theory, policy, and data, what is not working to assist you to design solutions that solve problems at the systemic levels.
4. Understand the institutional pressures to become a “privatized” (self-interested) academic, often at the expense of our cultural responsibilities to work collaboratively and collectively to improve existing conditions of high and disproportionate levels of inequity and marginalization.
5. Actively support Indigenous student access, participation, retention, support, and success
6. Critically understand and challenge policy and practices that marginalize and undermine the legitimacy of Indigenous language, knowledge, and culture.

B. Critically Understanding Transforming Institutional Structures, Systems, and Practices

1. Be clear what you are struggling for, what the goal of change is. It may involve different strategies and practices at different times, for example,
 - Struggle for inclusion, for equal access and participation in the dominant societal culture and structures
 - Struggle to make space for difference, for recognition of the validity of cultural difference – Indigenous knowledge, culture, and practice, make space for indigenous self-development.
 - Struggle to develop bicultural elements, for the development of bicultural outcomes (the best of both).
2. Understand that public institutions reflect dominant societal interests and often have systems and practices that maintain and reproduce this situation

and the privileges infused within it. Indigenous and other minority groups' interests often struggle for the fundamental rights of recognition, inclusion, and legitimacy.

3. It is important to see that institutional structures and practices were created by human beings with interests, as such systems can reflect dominant group interests through selection, validation, and other mechanisms. These are often problematic and contribute to Indigenous underdevelopment rather than accepting hegemonic deficit explanations. Change needs to be targeted at the system as much as changing Indigenous learners.
4. Systems that select students before they enter the front door and that determine the curriculum and pedagogies are often using sophisticated data and arguments that are fundamentally about exclusion rather than selection. These selection systems and the data used to make decisions need to be interrogated. This also applies to the ways in which scholarships are awarded with arguments used that continue to privilege students from specific backgrounds who have had specific educational opportunities and developed specific educational profiles.
5. There is often much to be done in transforming conservative institutional policies which tend to reproduce the status quo circumstances of unequal access, participation, retention, and success. It is important to engage with the Institution's Strategic Vision, planning processes and institutional or corporate rhetoric to identify opportunities, influence discourse, and create an environment for change. There is also a need to monitor "well-meaning" rhetoric that ostensibly is responding to Indigenous needs to ensure that the intended outcomes are in fact realized.
6. Some areas that are constantly being challenged by Indigenous workers are the need for more Indigenous academic staff, more Indigenous focused courses that respond to Indigenous interests, developing more research that has applied and beneficial outcomes for Indigenous communities, developing more meaningful accountabilities for "underperformance" in the institutional environment in respect of Indigenous populations, and developing more positive and proactive recruitment strategies to encourage Indigenous students.

C. Building Innovative and Transformative Strategies

1. Significant work must be developed around academic courses and programs to ensure there is curriculum space for Indigenous knowledge, thinking, and engagement with communities.
2. Build a distinctive section in the Institutional plan that creates policy, practice, and outcome targets for Indigenous change including student outcomes, staff and faculty outcomes, meaningful engagement with communities, and respectful relationship and research outcomes.
3. Build horizontal (institutional wide) strategies as well as vertical (Department, Program & Faculty) strategies. For example, there is often need to build a critical mass of Indigenous Professors that can participate at Senate and Institutional wide level as well as more Indigenous staff to teach in

Faculties and Departments. More generally there is a need for Indigenous staff to be spread across the whole of the institution at all levels.

4. Build on existing Indigenous success as much as target areas that are underdeveloped; where appropriate set targets and timelines.
5. Understand the Institutional context – what it is charged to do as a public institution and build Indigenous responses that align with and perhaps stretch these policy frames. For example, if you are in a Polytechnic institution then you might seek trade training programs of Indigenous excellence; if you are in a “Research-led” institutional environment, you might build Indigenous PhD programs or Indigenous Research programs and so on.
6. Encourage the respectful and careful co-designed use of Indigenous culture. Make it visible and positive within the institution, including the use of local and appropriate in a secular and institutional context, Indigenous language, elders, ceremony, art and performance, buildings, and landscapes.

D. Building Community Support and Interface

1. It is important to raise the consciousness of institutions in respect of the colonization of the Indigenous populations and how that has had an impact on local and regional and national Indigenous communities. It is also important to raise awareness about how public institutions are complicit in the ongoing colonization of Indigenous communities and what might be done to counter this situation.
2. A significant aspect of Indigenous struggle in the academy is to ensure its relevance to Indigenous communities of interest. It is often important for individuals to have the support and sometimes formal “consent” of community as it is “easy” for institutions and others to minimize your critical work by positioning you as only an “individual” voice and therefore of little substance.
3. There is often some suspicion of the academy and researchers by Indigenous communities whose experience has not been positive. As such there is a need to work on building individual credibility to communities of interest as much as there is a need to build institutional trust and credibility.
4. An important strategy is to build community participation with the institution – the use of elders and wisdom holders, leaders, and cultural/ceremonial events. These elements need to be more than tokenistic, decorative participation at university ceremonies such as graduations.
5. There is often need to struggle to have indigenous work with community recognized and “counted” as legitimate academic work, research, and service.

Critical Reflection as the Transforming Work Unfolds

While these are just a few of the strategies that one might adopt as an Indigenous worker in the academy, how we do this work and how we evaluate its effectiveness improve Indigenous outcomes. There is also need to continually critically evaluate

the effectiveness of our transformative work. The following framework – which Graham has called the “Five tests for the veracity of a Kaupapa Māori/Indigenous transforming approach” is an example of a self-reflecting model from the New Zealand context – again this is an idea that others might build on and adapt in their cultural and academic contexts.

Positionality

Where one speaks from is important; there is need to locate ourselves in time and space. There is a need to clarify why one is speaking. We should be clear about our own capacities and limitations. What is the transforming record of achievement that lends legitimacy to your work? What is your experience, what are your stories that support the validity of your commentary? There is a need to understand, who the audience is? How am I connected to the topic and to the audience? Other important questions here include What and whose interests are served by my work? How do I engage with Indigenous frameworks and theorizing?

Where we speak from and how we speak is important. As a matter of practice, deconstructing one’s own positioning all the time is an important element of an Indigenous approach. The principle of relationality or relationships is a dynamic concept that supports positionality. We often ask our students to write a preamble to their thesis and position themselves and their story into the thesis – this allows students to introduce themselves culturally and establish the basis for their work. It is an important pedagogical practice among many Indigenous groups. In this sense, it is important to introduce oneself and to appropriately connect and identify with the topic being undertaken. Other critical questions include What are your credentials for doing this work? Where are you speaking from? Do you have particular interests (overt or undisclosed) which impact the work that really should be declared/problematised? Understand what you are for rather than just what you are against.

Criticality

There is a need to have a good understanding of the historical, social, cultural, economic, and political relations of inequality, privilege, and colonialism and an understanding of how these relations are produced and reproduced. A fundamental understanding here relates to how power is exercised and manipulated by dominant interest groups to maintain power and control over other minority groups and colonized populations.

Do your transforming intentions adequately account for the politics of our existence?

Are you able to use critical understandings and tools? More importantly, do you understand how colonization is continuously formed and reformed over the top of

us? Do you have the critical understandings and knowledge to argue for the theoretical space for the validity of Indigenous language, knowledge, and culture interests? If you are unable to read the world critically, your efforts at transformations and interventions may come up short.

Do you have an appropriate level of critical appreciation to be able to accurately contextualize the politics of the work that may extend to such issues as understanding the impact of

- Unequal power relations?
- Neo-liberal economic context?
- Production and reproduction of inequities?
- Social construction of knowledge?
- Racism, sexism, homophobia, able-ism
- Knowledge hierarchies and the marginalization of Indigenous knowledge?
- Race, gender, and class politics?
- Hegemonic thinking, internal and self-colonization?

Structuralist and Culturalist Considerations

There is need to work at both culturalist and structuralist change. By culturalist change we mean those changes which people can influence, human agency, and specifically, human behaviors, attitudes and discourses. However, it is not just about changing people as this can become deficit oriented as an approach. We must also challenge the dominant structural impediments that constrain Indigenous cultural, social, and economic interests. Structuralist thinking argues the influence of societal structures over human agency as being inevitable, that is, that our struggle is not one struggle, but many struggles often in multiple sites, in multiple shapes and often simultaneously.

Praxicality

Praxis is an important element in a Kaupapa Māori/transforming approach. An important element underpinning transforming is the relationality of theory and practice, that is, what we do and the rationale for doing it. A further element implied here is the notion of constant reflection and adjustment, a dynamic cycle of review in order to maintain momentum. What are the practical and theoretical elements involved? Praxis requires us to constantly reflect on what we are doing (usually with our communities of interest) and to be responsive to the actions and reactions as they occur. A critical component is the necessity to continually evaluate our transforming intentions with the communities of interest for whom the change is intended. Praxis involves a continuous cycle of action, theory and reflection and reaction. There is a need to test our theorizing against our practical enactments and test our practice

against our theory. Praxicality is a day to day way of thinking and going about indigenous work.

Transformability

Given existing and disproportionate levels of Indigenous crisis, there is a need to accent transforming outcomes. The critical question that surfaces is “What changes as a result of what we are doing?” We need to be not just intentional but accountable for practical and tangible outcomes. Graham refers to this elsewhere as the need for Indigenous workers to get blisters on the hands (Smith, G. 2017). Importantly, what positive changes are there for Māori as a result of your engagement? Maintaining the status quo is often insufficient as it maintains the existing situation of unequal power and social relations. It is important to focus on projects that do not simply describe our pathology but move to enact the transforming of our condition. There is a need to move beyond the reproduction of the status quo and develop meaningful transformative outcomes.

In Conclusion

There are many Indigenous workers and allies across different jurisdictions, who, over many decades, have argued for Indigenous people, Indigenous knowledge, and Indigenous rights in the academy. They have also established pockets of support and respite for Indigenous people who, despite many obstacles, have attended and graduated from universities. There is another story in there about how they achieved success which this chapter has not addressed. Many of that first generation have had to do their work with little community understanding of what is at stake in the struggle for space in the academy. We were fortunate to have had the support of several well-known New Zealand scholars who had hidden their Māori identities and were reluctant to reveal themselves either in the Māori context or the university context. What they did for us was to open doors and quietly support with their votes, their words, and their experience.

The recognition of Indigenous Peoples in the international context of the United Nations has also been a long game. The international work and the local work within a specific institution are part of the wider struggle for Indigenous recognition and the survival of Indigenous knowledges, languages, and cultures. The academy is one powerful site in which this work needs to be done, but it not the only site. As we have both said in many different contexts, our struggles are multiple, layered, and nuanced and require simultaneous actions. Some of our colleagues may see this work as daunting, a burden and ultimately undermining of a “normal” academic career. In contrast, we see the work as “our normal” of what it means to take on indigenous work in the academy. In reflecting on the work of Indigenous workers, there is a need for all of us to appreciate that what may seem a utopian vision is worth striving for

and maybe won through a series of small and incremental gains rather than singular and spectacular actions.

Part VI

Case Studies

Sharon Nelson-Barber and Zanette Johnson

Sharon Nelson-Barber and Zanette Johnson

Abstract

Looking deeply into our own community histories and learning from one another's experiences provides us with new paths into the future. By becoming aware of the patterns in community processes for cultural self-determination, and by sharing stories across communities, we can build on our strategies and our understandings of one another's solutions to create realities that reflect our local Indigenous values and practices. Similar community-transforming strategies may lead to very different outcomes, due to the profound diversity across Indigenous cultural settings. Indigenous communities that invest in taking risks to try new things and search for effective solutions to persistent issues will continue to grow the circle of beneficial innovation as they document and share their experiences. Understanding the successes of different Indigenous groups and learning how to make appropriate and responsive adjustments are important steps to accelerating cross-community diffusion of powerful, values-aligned approaches.

sharing stories across communities, we can build on our strategies and one another's solutions to create realities that reflect our local Indigenous values and practices. Similar community-transforming strategies may lead to very different outcomes, due to the profound diversity across Indigenous cultural settings. Indigenous communities that invest in taking risks to try new things and search for effective solutions for persistent issues will continue to grow the circle of beneficial innovation as they document and share their experiences. Both understanding the successes of different Indigenous groups and learning how to make appropriate and responsive adjustments are important steps in accelerating cross-community diffusion of powerful, values-aligned approaches.

The chapters in this section examine Indigenous experiences across formal and informal learning contexts, and each one is written to highlight case studies and case examples that provide nuanced detail about where they are situated. The accounts structured in this form offer a broader descriptive bandwidth than quantitative studies. The use of cases can help readers imagine and expand the potential adaptability of each vignette. Some of the authors have used case research methods to engage in deep internal observation, for example, to examine the challenges of moving away from practices that are widely accepted outside Indigenous contexts. Other authors included here have been influenced by the successes of distant Indigenous communities and adapted promising ideas for use in their own settings. An emergent theme across all of these quests is the search for patterns: understanding the patterns in our own process that help us to align with our shared values and seeing which patterns to carry forward that may help us continue to thrive.

There is a profound diversity that characterizes us as First Nations and Indigenous communities, and yet we have faced many types of parallel challenges, such as the effects of land loss, colonization, aggressive assimilation, and navigating collective and personal journeys through cultural trauma. We each have found our ways of discerning when to yield and when to resist the paradigms and practices of the dominant Western culture. In today's historical moment, we strategize to address the immanent changes brought by climate instability, looking to the past for ideas about how to adapt rapidly and survive as peoples. In recent decades, we have seen how our collective efforts can inspire one another to creative solution-building that brings about positive changes.

Step by step, we are returning to cultivating our own languages across generations, reclaiming our cultural lifeways, and starting to resolve some of the contradictions that have become pervasive in daily life. We step back to assess our efforts and wonder: Are our efforts getting results that matter? Are we doing things in ways that reflect our values deeply? Are we relating to one another in the ways our ancestors would have understood and respected? Are our children becoming a next generation who we can trust to carry our cultures forward?

The cases in this section recount in depth how First Nations and Indigenous communities are responding to questions like these, and others. They examine the patterns in their own processes – and account for the diverse perspectives that have influenced them; they dig deeper into the realm of reflection, to see how their

community initiatives are, and are not, rising to meet the challenges of modern local/global Indigenous life.

The case written by Jo-ann Archibald Q'um Q'um Xiiem entitled ► [Chap. 56, "Raven's Story About Indigenous Teacher Education"](#) uses storywork methodology to offer a rich example of how the Native Indian Teacher Education Program (NITEP) at the University of British Columbia (UBC) in Canada continues its over 40-year history of offering an Indigenous-based K-12 teacher education program. The NITEP includes partnerships with many Indigenous communities/organizations and has a rich history of Indigenous leadership that has shaped its purpose, philosophy, and structure including four key principles: a cohort-based family approach; community-based relationships; incorporating Indigenous Knowledge Systems in teacher learning; and high-quality preparation of teachers that spans different types of standards. These components derive from the character of Indigenous trickster, Raven, and they guide NITEP's vision of systemic change to ensure that Indigenous people have a better life within and through education. Working together to create the NITEP, Indigenous educators have constructed a culture-based model of teacher learning that looks deep within and stands as an example for how this type of innovation can be seeded and sustained.

Contrasting cultural perspectives appear side-by-side in the work of O. Ripeka Mercier, a Māori scholar, and Beth Leonard, a Dene'/Athabaskan scholar who co-teach a class for diverse Indigenous and non-Indigenous university students on Western science and Indigenous knowledge. In ► [Chap. 60, "Indigenous Knowledge\(s\) and the Sciences in Global Contexts: Bringing Worlds Together,"](#) the authors wonder together about the role of Indigenous knowledge in society during our time of cultural and climactic change. Mercier and Leonard consider with their students what makes Indigenous knowledge "Indigenous" and distinctly valuable, in a time when there is so much pressure to engage with decontextualized, colonized narratives about valid knowledge. In this research case carried out over the past 10 years, Mercier and Leonard describe how they structure a "shared space" within the course for students from two universities spanning the Pacific that allows all points of view to be heard. They invite frank discussion of how some scholars view science as a subset of Indigenous knowledge, and how others dismiss Indigenous knowledge as nonscientific. This discourse around Indigenous knowledge in science furthers their objective of providing science education support for marginalized groups, including the Māori, Alaska Native, and non-Indigenous students who they bring into conversation together across the distance. This case illustrates the type and quality of transformative learning interaction that can take place when an open, curious community of people is carefully brought together from diverse backgrounds, with varied perspectives, to build meaningful relationships, and consider urgent issues affecting the global human experience.

In ► [Chap. 61, "Mā te Rourou: Māori Education and Innovation Through the Visual Arts in Aotearoa New Zealand,"](#) Robert H.G. Jahnke and Huia Tomlins Jahnke provide a descriptive look at the evolution of the tukutuku form of lattice work lashing as it has spread from its original context embellishing the walls of tribal

houses on marae, to settings far beyond, including schools, galleries, institutions, and even the global forum of the United Nations. The diffusion and transformation of the tukutuku art form by artists in the twentieth century has been driven by increased interest and understanding of Māori visual arts traditions; it has both inspired and grown along with emergent educational approaches that are culturally rooted and innovative. The use of tukutuku lattice work patterns outside the marae has renewed interest in the traditional visual patterns and revived participation at schools and universities that encourage culture-based education and integrative pedagogies. Bringing together students, sense of place, and this traditional art form, along with new contexts for display and interaction, tukutuku has preserved its place in the Māori canon, and also evolved and gained a new standing in contemporary art. The journey of tukutuku shared in this case stands as a valuable model of how traditional techniques can be carried forward as deeply connected cultural templates for the creativity and viability of future generations.

► [Chapter 57, “We Voyage for the Earth: Cultural Advantage as a Global Education Framework,”](#) authored by Shawn M. Kana‘iaupuni, directs us to acknowledge the power of the Mālama Honua Worldwide Voyage as a landmark achievement that represents what becomes possible when communities take control over their educational systems. As the fruit of many years of culture-based education at many Hawaiian-focused charter schools, the global voyage of the Hawaiian canoe Hokule‘a was accomplished as the result of an educational movement that recognized Indigenous students’ fundamental cultural advantage. Unlike Western schools that falsely “prove” these students are underachieving on standardized test measures and then set habitually low expectations, culture-based education initiatives emphasize Indigenous learners’ cultural assets and build on those strengths and the resilience within their cultural identity to help them grow. Kana‘iaupuni argues that one cannot underestimate the value of community-based research and leadership that embraces the cultural advantages of students who have diverse experiences of resilience, spirituality, and strength, on the one hand, along with racism, poverty, cultural trauma, and oppression on the other. Using theories, methods, and approaches that highlight the assets found in Indigenous knowledge, values, and stories as models of vitality and empowerment for all, culture-based education is an innovation worth researching and sharing. As the result of a nationwide Hawaiian movement toward culture-based education with diverse approaches to culturally vibrant and identity-affirming learning environments, Mālama Honua Worldwide Voyage reveals that Indigenous communities have the power to reach across space and time to connect and inspire one another.

Rooted in a Māori worldview, the case described by Mere Berryman, Katie Pennicot, and Stan Tiatia follows a new leadership team in one Aotearoa New Zealand primary school who successfully disrupt the status quo expectation that, from entry at age 5, the gap in achievement between Indigenous and non-Indigenous students would only continue to grow. ► [Chapter 62, “Te puna wai ora, e tu atu nei e: Stand Up, Stand Strong, and Be Proud”](#) tells the story of 6 years of change efforts, aimed at encouraging Māori contexts for learning in the schools and the development of school leaders’ beliefs and practices in alignment

with Māori principles. Eventually, the school was recognized as a finalist for the Prime Minister's Excellence Awards in Education, and perhaps more importantly, a cohort of Māori students were spared the pathologizing "deficit" model in favor of a culturally coherent priority on whānau (extended family), relationships, and core values which formed the foundation for academic and interpersonal success. The school pioneered the practice of listening to iwi (tribal group) perspectives about the direction of English-medium education for Māori learners, and in turn placed greater value on intergenerational Māori learning. Challenging the historical educational assumption that Māori and Pākehā children were being prepared for different life trajectories, the transformational leadership of the team at Invercargill Middle School showed undeniably how the development of Mauri Ora (life force) for Māori students is beneficial for academic success, and that it may also be of benefit for non-Māori students.

Jean-Paul Restoule's piece, ► [Chap. 63, "Where Indigenous Knowledge Lives: Bringing Indigenous Perspectives to Online Learning Environments,"](#) highlights two cases that show the opportunities, challenges, and limitations of designing Massive Open Online Course (MOOC) materials focused on the topic of Indigenous worldviews. Restoule designed and researched the course, which was meant for principals in First Nations schools across Canada; his aim was to invite learners of diverse backgrounds and worldviews to engage with Indigenous knowledge traditions in respectful and perspective-expanding ways. Going deeper than the surface-level features of Indigenous knowledge that typically find their way into online learning, Restoule sought to create meaningful exchange between participants while maintaining a culturally appropriate tone for all in the decontextualized online space. Elements of land-based, community-first, and relationship-driven learning were incorporated, as well as an expectation of whole-person engagement that called for openness to spiritual, emotional, intellectual, and physical dimensions of narrative experience. One goal of the courses was to challenge divisive colonialist legacies by rising above historical divisions – to connect through a sense of shared struggle and to honor personal narratives and community stories of cultural resurgence. In this work, Restoule calls upon us to know the limitations of the digital medium and also to see its potential: to awaken participants to the power of coming together across lines of difference to inhabit the dual role of learner and teacher through interpersonal experiential learning.

The reciprocal and simultaneous role of ako, to learn and to teach, is at the heart of Sandra L. Morrison's chapter on Indigenous education in the adult workplace – ► [Chap. 58, "Ako ki he nofo 'a Kāinga: A Case Study of Pastoral Care Between Wakatū/Kono and Recognised Seasonal Employment Workers".](#) In this chapter, Morrison describes the kinds of essential supports needed by those entering a new country as labor migrants, so that they can healthfully adjust to their new workplace and home. Within a strongly capitalistic society where human labor is treated as a commodity, respect for different cultures must be negotiated; some employers offer only the minimum transition services, while others adopt a more caring "family" model of structural support. Morrison describes in detail the case of a Māori employer and their interactions with immigrant Tongan Recognized Seasonal Employment workers who participated in a successful pastoral care model based on ako (to learn

and to teach) and *kāinga* (kin, village, place) – a model that strengthened their formal business relationship through mutual respect for shared values, including genealogy (*whakapapa*). The intentional application of Māori values and worldviews allowed room for the Tongan workers to contribute their cultural capital to the interaction, demonstrating the kinds of positive outcomes that can emerge when consideration is given to common values such as kinship across culture, space, time, and generations.

Set within an Aboriginal Australian context, Daryle Rigney, Steve Hemming, and Simone Bignall chronicle a community journey in ► [Chap. 59, “Ngarrindjeri *Yannarumi*: Educating for Transformation and Indigenous Nation \(Re\)building.”](#) The term *Yannarumi* refers to a Ngarrindjeri concept meaning “to act or speak lawfully as a country” and is fundamentally connected to understandings of peaceful relations and well-being. Since the early 1970s, the Ngarrindjeri people have built an active, resistive, and transformational educational program designed to produce the conditions for community thriving and self-determination – one that is based on Ngarrindjeri knowledges, experience, language, and philosophy. *Yannarumi*, in association with the broader nation building and governance strategies currently practiced by the Ngarrindjeri, is presented as a case study in educating for resistance and transformation. Ngarrindjeri leaders have consistently exercised and asserted their right to “speak as a country” in establishing a peaceful, healthy, and just way of life. The community aspiration is to establish a state of “ex-colonialism,” and while the setting and terminology are unique, the steps of their journey may inspire other communities of Indigenous people who are seeking their own methods to transform the colonial legacy and establish a new equilibrium in educational systems that are self-governing and culturally sustaining.

In ► [Chap. 64, “Whāia te Ara Whetu: Navigating Change in Mainstream Secondary Schooling for Indigenous Students,”](#) researchers Elizabeth McKinley and Melinda Webber describe the design and implementation of a long-term secondary school research intervention called the Starpath Project for Tertiary Participation and Success. Aiming to remedy long-standing issues in some of Aotearoa New Zealand’s most underserved communities, the Starpath Project sought to increase Māori students’ university entrance by changing school pedagogy and improving opportunities for learners. Special learning support was provided for school leaders along with direct assistance to enhance school quality, while students received counseling support and guidance in academic target setting. Starpath encountered a number of challenges, including changes to policy that made their key metric of university entrance even more difficult for students to attain. Analysis of data showed that the results of the intervention were mixed, due at least in part to unexpected policy changes and to the lifetime of unequal access to educational resources that most students had experienced. Māori students in mainstream schools who do not have access to culture-based learning may require additional levels of support in pursuit of academic success. This case illustrates how Indigenous communities seeking to correct long-standing educational inequities may want to reflect deeply on their implicit assumptions about how positive changes take root in their context, and consider as well adopting extended timelines for longitudinal interventions so that sufficient time can be devoted to changing student experiences and the institutions that shape them.

When a group of Diné (Navajo) culture and language teachers identified their priorities for systemic educational change, Zanette Johnson and Sharon Nelson-Barber noticed they frequently mentioned the constraints of adhering to “best practices” as a significant barrier standing in the way of meaningful innovation. Observing and inquiring more deeply about this phenomenon with the teachers led Johnson and Nelson-Barber to report their findings in ► [Chap. 65, “Always Alert, Always Agile: The Importance of Locally Researching Innovations and Interventions in Indigenous Learning Communities.”](#) A case example from Diné school contexts points out how the research-based “best practice” of Comprehensive School Reform (CSR) limits the range of learning for Diné students and teachers. A contrasting case example based in Hawai‘i presents another school’s quest to go beyond generalized research and enact locally tested strategies that were culturally compatible. The authors argue that within Indigenous community settings, scientific research is being overgeneralized and misapplied, because it is unreasonable to assume that interventions that work for the general population are appropriate for communities with unique historical factors and cultural contours. As seen in the case examples, the unexamined use of research-based intervention can lead to limited results for Indigenous learners and may be actively counterproductive by inhibiting achievement and discouraging deeper learning experiences. Indigenous-serving educational institutions are poised to strengthen learning in their communities. They must enact a standard of iterative and empirical research that uses varied methods of assessment and a range of vantage points to locally confirm results and to adapt strategies in response to the distinctive populations they serve.

Abstract

In 2017, the Native Indian Teacher Education Program (NITEP) at the University of British Columbia (UBC), Canada, continues its 43rd year of offering an Indigenous-based teacher education program (kindergarten to grade 12) that includes partnerships with Indigenous communities/organizations and other post-secondary institutes throughout British Columbia, Canada. NITEP is a Bachelor of Education (BED) degree program option for people of Indigenous ancestry, within the UBC Faculty of Education. This program has a rich history of Indigenous leadership that has shaped NITEP's purpose, philosophy, and structure. Four values have also guided NITEP's development and program revision

J.-a. Archibald Q'um Q'um Xiiem (✉)
Faculty of Education, University of British Columbia, Vancouver, BC, Canada
e-mail: jo-ann.archibald@ubc.ca

over a 40-plus-year time period: (1) a sense of community/family within the student body and faculty/staff, (2) community-based relationships, (3) the importance of Indigenous knowledge systems for teacher preparation, and (4) good quality teacher preparation.

These values have become the core identity of NITEP. Throughout the years, the practices, program delivery, and program requirements have changed, but the core values/identity of this program has become even stronger. Another steadfast part of NITEP is the Indigenous trickster, Raven. The NITEP founders who were mainly Indigenous teachers chose a traditional story of the Raven and Sun to guide NITEP's vision and purpose. This chapter is based on Indigenous Storywork principles of respect, responsibility, reverence, reciprocity, holism, interrelatedness, and synergy. Both traditional and life experience stories show how NITEP enacts the four values and its successes and challenges throughout its rich history.

Introduction

This chapter will explore the history, philosophy, epistemology, and pedagogical practices of one Indigenous Teacher Education Program at the Faculty of Education, University of British Columbia (UBC), Canada: the Native Indian Teacher Education Program (NITEP) which is a Bachelor of Education (BEd) degree program for people of Indigenous ancestry. This program is presented as a combined case study and “case story” based primarily on the lived experiences of the author, Jo-ann Archibald, also known as Q'um Q'um Xiiem, of the Stó:lō and Xaxli'p First Nations of British Columbia, Canada. I have worked for NITEP for 19 years as an instructor, a course developer, a coordinator of a NITEP field center, and a director of the program, even though my NITEP work spanned the years from 1981 to 2016. At times, I left the program to work in other areas of UBC, but I returned to NITEP a few years at a time, just like a family member may leave home but returns for sustenance and to help out as needed.

I live on the west coast of British Columbia, Canada, where the Pacific Ocean greets the traditional and unceded land of the Musqueam First Nation every day. Ravens and eagles watch over this land. I write from the perspective of a First Nation woman scholar who has worked at the University of British Columbia for over three decades. In this chapter, I use first person, which is becoming an Indigenous convention in scholarly writing (Absolon 2011; Kovach 2009; Wilson 2008). I also use terms such as Indigenous and Aboriginal interchangeably, for variety, as those terms are commonly used in Canada today. Indigenous is used more frequently; however, the use of Aboriginal emphasizes legal rights in the Canadian Constitution for First

Nations/Indian, Inuit, and Métis peoples. Other times, I use terms such as Indian and First Nation to either denote the time period in which the term was used or to signal the context in which the term is used. As I write about Indigenous teacher education, many memories and stories come to my mind and to my heart. These memories and stories are about those who created solid Indigenous educational pathways at UBC and those who traveled on them for work and study. This chapter presents stories of lived experience with and about the NITEP at the Faculty of Education, University of British Columbia. These stories use an Indigenous Storywork theoretical and methodological framework that I developed years ago (Archibald 2008).

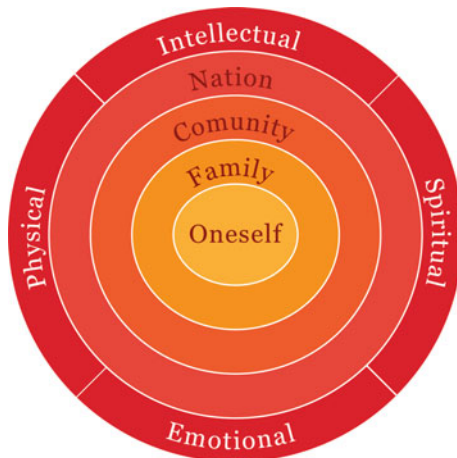

Theory and Methodology

The Indigenous Storywork framework (Archibald 2008), which is both theoretical and methodological in nature, encompasses seven Indigenous-based principles/values of respect, responsibility, reverence, reciprocity, holism, interrelatedness, and synergy. I built upon the 4Rs of respect, responsibility, relevance, and reciprocity first articulated by Verna J. Kirkness and Ray Barnhardt (1991) in reference to making higher education more successful for Indigenous learners. They advocate that the university context needs to have programs and student services that demonstrate respect toward Indigenous learners, that programs are relevant to the needs and cultures of these learners and their communities, that students and the university enact their responsibilities to improve Indigenous higher education, and that a reciprocal relationship exists between Indigenous people, their communities, and the university. With the 4Rs, Kirkness and Barnhardt (1991) imply that the university needs to change and develop its policies and programs in order to be more successful with Indigenous learners. NITEP, as a university program, exemplifies university responsibility and responsiveness to Indigenous learners and Indigenous communities, which will be elaborated upon in this chapter.

The theoretical component of Indigenous Storywork includes the principles of respect, responsibility, reverence, and reciprocity, which relate to ethical ways of working with people and with Indigenous knowledges. The remaining principles of holism, interrelatedness, and synergy relate to how Indigenous knowledges and Indigenous traditional and life experience stories are used in the research process. The term storywork is coined from a Stó:lō–Coast Salish cultural way of focusing attention on learning or “working” with stories. In our cultural gatherings, a spokesperson tells the people gathered, “My dear ones, the work will begin.” When we hear these words, we pay attention to what we hear, what we see, and what we feel because the culturally based work is important to individuals, families, communities, and the larger Indigenous nation in that moment and for the future.

Respect is focused on the cultural knowledge embedded in the traditional and life experience stories and for the people who tell their stories. Taking the time necessary to develop respectful research and educational relationships and to learn cultural protocols is an important ethical responsibility. Reverence is a deep respect for the spiritual nature of humans, nature/land, and for this part of Indigenous knowledges.

Fig. 1 Holism for Indigenous Storywork

Prayerful thoughts and words, time spent in nature, engagement in ceremony, stories, and songs are some examples of reverential actions. Reciprocity becomes a circular action of receiving knowledge through respectful, responsible, and reverential approaches and “giving back” to the people or community with whom one has worked so that Indigenous knowledges are sustained in ways that are beneficial to the Indigenous people and their communities.

Indigenous knowledges and stories often have a holistic nature where they contribute to human spiritual, emotional, physical, and intellectual development (Archibald 2008; Battiste 2000; Brant Castellano 2000; Cajete 1994, 1999; Sarris 1993; Silko 1981; Sioui 1992). An Indigenous concept of an inclusive holistic circle places these four components in quadrants as indicated in Fig. 1. The principle of interrelatedness creates the possibilities of relationships among the holistic components as well as among oneself, family, community, and nation. When stories are shared and when people use them to conduct serious cultural, educational, and research “work” using the principles as described, a wonderful synergy happens that can have a transformational effect.

The principles of holism, interrelatedness, and synergy also create space for meaningful interaction among participants engaged in the storywork setting who listen to life experience and traditional stories (gather data), make meaning from them through critical reflection and discussion (analysis), and develop new knowledge and understandings based upon their learning experiences and interactions (identify findings).

NITEP’s Storywork

NITEP’s storywork in this chapter is based on the teachings derived from a traditional story and my reflective stories working with NITEP from 1981 to 2016. My roles with NITEP included being a sessional lecturer developing and teaching

Indigenous education courses at the NITEP regional field centers. Then I became a full-time 12-month lecturer, located at the Chilliwack NITEP field center, for 2 years and subsequently became the NITEP director in 1985, which, at that time, meant I left my home in Chilliwack and moved to Vancouver. I also returned to NITEP in the role of director for two different terms between 2005 and 2016. My years of experience working within NITEP have enabled me to work with many people and to lead a program that keeps evolving in its Indigenous foundations. My NITEP experiences and understandings facilitate the enactment of Indigenous Storywork principles to create NITEP-related stories and to develop understandings about these lived stories. I begin with a letter that I wrote in 2007. At that time, I was reflecting on my work with NITEP for another paper that I did not finish writing. This reflection was written as a letter to my grandfather, Francis Kelly, who had passed from the physical world into the spiritual realm, many years before. I chose to write the letter to him because he had been an important teacher to me and his mentorship shaped my subsequent work in education, in particular Indigenous teacher education. This letter also introduces some important NITEP values such as family and culture and issues about intergenerational trauma as a result of Indian residential schools.

Letter to my Grandfather, 2007

Dear Grandpa,

I have been thinking about my work and about telling others, especially Indigenous people, who may want to teach and work at a university what it has been and is like. In the circle of Elders who have surrounded me with good stories and teachings, I imagine them telling me to 'think back' and as educators say today, 'reflect.' Doing this 'thinking back' reminds me of the way that you and other Elders tell us your life experience stories to help us, the listeners, learn from them. So what is it that I can share with others that may be of some use? Why do I think that what I have experienced is of any value? Or can I tell a good story? Can I call on Raven or Coyote to help me?

As I think back on my work life at UBC, it is hard to believe that I have been there for over 25 years (as of 2007). Imagine that! When I started to teach there in 1981, it really did not feel like I was teaching at a university because I traveled to BC communities such as Williams Lake and Kamloops to the former Indian residential schools to teach students in the Native Indian Teacher Education Program (NITEP) courses about Indian education history, policy, and other such matters. At that time, the residential schools no longer operated as schools that denied Aboriginal languages, cultures, and values and instead tried to instill Christian or now we say, Western knowledge and values.

What a turn around, imagine Aboriginal people learning to become teachers with an Aboriginal heart and mind, learning to become teachers, qualified to teach in any school, and doing their learning in buildings that not that long ago tried to take the 'Indian out of the child.' Maybe this is the story that I can tell. A story that shows how Aboriginal people resist being colonized in learning institutions, even though, colonization happens in many forms, and it is a constant struggle to maintain and strengthen an Indigenous heart and mind in academe. It is possible, but it is hard.

During my teaching at one the NITEP field centres, some students who were in the course had said that they had attended the particular residential school in which we were learning. It was hard for them to be in such a classroom where they remembered it being a dormitory where either they or their family members slept and all the terrible memories of loneliness, physical, sexual, and emotional abuse that they recalled. But the NITEP students were determined to be teachers who would make a difference in the lives of the children whom they taught. That commitment kept them going and kept them coming back each year until they completed their Bachelor of Education. The program offered Elders' guidance and other counselling options as well as a safe space in which to share these difficult memories. Often during the Indian Studies courses, the NITEP students experienced a conscientization of the impact of colonialism, sometimes getting mad because of the policies that forbade their Indigenous languages to be used or feeling despair because of the realization of the intergeneration effects of years of schooling that took away their Indian identity and family closeness and then seeing how colonization continued in their communities and schools today. I recall seeing NITEP students coming into the program at first not knowing anything about their culture and not thinking it was that important, to moving to anger about the impact of colonization, to eventually finding a way to understand what happened to their parents and grandparents during this dark time of their history, to leaving with a strong sense of who they were as an Aboriginal person, proud to be called, their First Nations names, and proud to be associated with the NITEP family network. NITEP provided a holistic space for its students to learn, to vent and experience their emotions, to soothe and strengthen their inner spirit, and to develop pedagogical plans for their future teaching.

Even though this reflective letter was written 10 years prior to writing this chapter, I felt that it captured some key values and issues that confronted NITEP students and those who led the program at that time and which are still prevalent today, not only in NITEP but in other Indigenous teacher education programs in Canada (Beynon 2008; Martineau et al. 2015) and elsewhere (in the USA, see Castagno et al. 2015). The struggles with understanding and dealing with the intergenerational impact of Indian residential schools and the transformational potential of a university teacher education program are prime examples. At the same time, I felt that what have endured throughout NITEP's 40-plus-year history are its values, which will be the focus of this chapter. The chapter will continue with the historical background of NITEP and a basic programmatic description, followed by a presentation of NITEP values and how those values are embedded in its programmatic structure, and then Raven gets a turn to tell its perspectives and encourages an identification of challenges before returning for one more word or two.

NITEP History

The Native Indian Teacher Education Program (NITEP) was established in 1974 as a Bachelor of Education degree program at the University of British Columbia's Faculty of Education. Students may specialize in elementary, middle, and high

school levels. This BEd degree is of a concurrent nature, where students of Indigenous ancestry from Canada take university arts/science courses along with education courses throughout their program. The university arts/science courses are taken at the local college/university. The education courses are offered by the UBC Faculty of Education (Vancouver campus).

In the early to mid-1970s, the term “Indian” was commonly used in Canada. NITEP students complete 2–3 years at a field center located in various areas in British Columbia before moving to the UBC Vancouver campus to complete the remaining 3–4 years of their BEd degree. The funds for operating a field center are provided by NITEP/UBC Faculty of Education.

The NITEP founding group members were mainly Indigenous educators who worked with a non-Indigenous faculty ally and dean of the Education Faculty to establish the first Indigenous teacher education program in British Columbia, Canada (More 2015). When NITEP began, it was estimated that there were 26 Indigenous teachers in the province of British Columbia out of an overall teacher population of 26,000 (Faculty of Education Proposal 1974). This very dismal number of Indigenous teachers was one of the key reasons for establishing a new program instead of trying to fix or adapt the mainstream program that was not relevant to or would not change to meet the needs of Indigenous people interested in becoming certified teachers. It is important to present some information about the political and educational context in Canada in order to understand the educational decisions that the NITEP founding group made.

Major research and educational reports began documenting the significant failure of schools to provide an adequate education for Indian/Aboriginal children, starting with the national Hawthorn Report (1967) that noted that 96% of Aboriginal students did not complete high school. I was among the 4% who completed grade 12. I certainly remember that many of the Indian students with whom I started elementary and high school with left school before grade 12. Across Canada, Aboriginal people felt that “enough was enough.” A national political movement to address the crisis in Indian education resulted in the development of the 1972 *Indian Control of Indian Education (ICIE) policy* by the National Indian Brotherhood (now Assembly of First Nations). The ICIE policy was based upon fundamental principles of local control of education, parental engagement, and embedding Indian values, culture, and language in the curriculum. This policy also advocated for more Indian teachers and to increase the cultural sensitivity of non-Indian teachers (Kirkness 1986). The founding NITEP group was coincidentally developing a proposal for an Indian teacher education program that included the principles of the ICIE policy.

The founding group chose the program logo of Raven holding the sun in its beak to symbolize a traditional Indigenous story that provides guidance and vision to the work of NITEP (Fig. 2). Raven is an Indigenous trickster character that often gets into trouble because it does not follow good cultural teachings, but sometimes Raven does something to help others. In the NITEP story:

Raven pitied the people who were living in darkness and had heard about the Sun that could light up the world. Raven decided that he/she would find the sun for them, so that they would

Fig. 2 The NITEP logo

have a better life. Raven went on a journey and after lots of effort and trickery, he/she found a hole in the sky, and captured the sun. Raven brought it back to the people of the earth.

NITEP is like the sun in Raven's beak. This important story, told from oral tradition, reminds the faculty, students, and community members associated with NITEP to find ways to ensure that it as a university-credentialed teacher education program meets the learning needs of all learners in the K-12 schools and in other educational contexts but, especially, the learning needs of Indigenous learners so that through education, they will have a better life. The NITEP story also challenges its graduates to use their "Indigenous heart and mind" values to transform Indigenous education.

NITEP Values

Foundational values of NITEP include (1) a sense of community/family within the student body and faculty/staff, (2) its community-based relationships, (3) the importance of Indigenous knowledge systems for teacher preparation, and (4) good quality teacher preparation. This section will present the meaning of these values and show how they are embedded in the programmatic structure of NITEP.

Sense of Community/Family

Indigenous people admitted to NITEP often enter the field centers as strangers to each other, or they may know each other because they live in the same community. A cohort structure has been a defining feature of NITEP since it started. However, NITEP students, faculty, and staff use the term "family" not "cohort" to describe their relationships toward each other while they are at the field centers. Another term

of “extended family” is used to characterize the network of NITEP groups at the field centers and at the UBC Vancouver campus.

Over its 43 years of operation, NITEP has had 20 field centers located in both rural and urban centers in British Columbia, although usually 3–4 centers are offered each year. In 2017, there are four NITEP field centers located at Williams Lake, Lillooet, Agassiz, and the UBC Vancouver campus. Field centers are established when the Faculty of Education has funds to operate one and Aboriginal communities/organizations indicate that they want to work cooperatively to host a field center and that potential student interest exists. Approximately 12–18 students, on average, attend each field center.

During the first 2 years, each NITEP cohort develops an interactive learning community where they learn from each other, pose critical questions of each other, and work both individually and cooperatively on learning projects. A NITEP coordinator, who is usually Indigenous, teaches the NITEP courses, recruits and mentors students, arranges student support services as needed, and maintains community relationships. Many coordinators are NITEP alumni and have teaching experience in public and First Nation schools. The NITEP coordinators' roles are essential for the success of the NITEP Centre and for facilitating students' holistic development as a future teacher. Because many of the NITEP coordinators have experienced the challenges and joys of completing a Bachelor of Education degree, they understand NITEP students' fears, issues, and opportunities, which they can address in courses and programmatic experiences.

The NITEP courses provide the opportunities for developing a caring professional learning community. When the field center is located in a smaller rural community, the students often form a closer bond because they take both arts/science and education courses together, whereas in a larger community, they have more choice in the arts/science courses or concentrations offered by the post-secondary institute in their region. NITEP provides two-three of its courses per year, except for the last year of the program; these courses also provide bonding opportunities.

In the senior years at the UBC Vancouver campus, NITEP students are fortunate to have the First Nations Longhouse that becomes their “home away from home” until they graduate (Kirkness and Archibald 2001). The 2,043 square meter Longhouse, opened in 1993, resembles a Musqueam traditional architectural style that includes space for individual and group culture/ceremony, study, social, learning, and meeting purposes. The NITEP on campus and main office is located in the Longhouse. NITEP students meet other Indigenous students enrolled in various faculties, fields of study, and undergraduate/graduate studies. Through the various student services offered by the First Nations House of Learning and on-campus programs, NITEP students may develop an extended family spirit to their studies.

NITEP also sponsors an annual NITEP student gathering at the beginning of the new academic year where those enrolled in a regional field center come to the Vancouver campus for a 1-day learning experience. The notion of extended family is emphasized so that each group/cohort gets to meet and learn from each other. This annual gathering serves as an introduction to the large university campus so that

students become acquainted with the location of UBC offices by walking on the land and visiting key offices that they will use once they are on campus.

Community-Based Relationships

As noted above, an Aboriginal community/organization is a necessary partner for a NITEP field center. It is these local community-based relationships that provide access to potential students wanting to become teachers; enhance students' learning through sharing its cultural, land-based, and other community services; and participate in policy and programmatic decision-making regarding the field center and overall program. NITEP students are also encouraged to maintain their community connections and relationships through course projects and educational placements.

An Aboriginal community may be a specific First Nation that is located on a First Nation reserve/Indian Band. An Aboriginal organization may be an Indigenous post-secondary institute sponsored by one or more First Nations or a partnership of Aboriginal groups that provide leadership to a public school district. There have been many different forms of NITEP/Aboriginal community partnerships over the years. Sometimes a formal agreement was established that identified the roles and responsibilities of the community partner and NITEP; at times a working relationship was established without a formal agreement. More will be said later about the difficulties and changes to these community-based relationships.

Each field center works with local Aboriginal community groups and engages community resource people such as Elders and cultural knowledge holders to mentor the NITEP students through cultural learning activities, talking to groups of students, and being available speak to individual students. A part-time Elders in Residence Program is offered at each field center. The Elders may be associated with or from the community partner(s), or they may be identified by students and staff. Examples of learning activities include leading plant/medicine walks, ceremonies such as the sweat lodge, cedar bark weaving, drum-making, telling stories, giving talks to classes, and attending the NITEP classes. NITEP provides honoraria and workshop/learning expenses for material and food.

Another important role for community-based involvement is through NITEP's First Nations Education Council (FNEC) that guides NITEP's program and curriculum policy and other pertinent program matters. Community representatives from the field centers; a Musqueam Elder; alumni; professional educational associations; the UBC Faculty of Education, Teacher Education Office; and First Nations House of Learning comprise the FNEC, along with student representatives from the field centers and on-campus groups. The community partner determines its representative. The NITEP student representatives have decision-making roles on this Council, and they provide field center reports at each FNEC meeting. The students' reports highlight center activities, successes, and challenges. The challenges are opportunities to review aspects of the program that may need improvement.

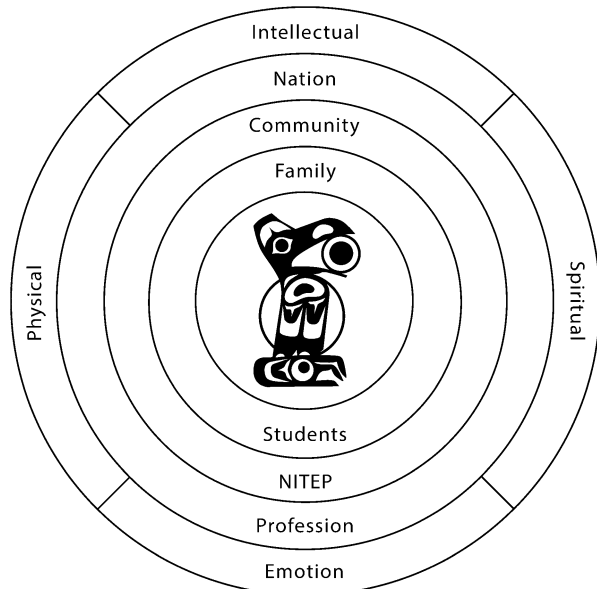

Throughout the years, the relationships with Aboriginal communities/organizations have waned at times, where student enrollment has diminished to the point

where a field center had to close. Those holding leadership positions in Aboriginal communities may change, or they may have other pressing priorities that need their attention, leaving a community leadership void for NITEP. In 2015 and 2016, two centers that had been at a location for 40 and 22 years, respectively, closed due to low student enrollment. It is very difficult, emotionally, to close a field center. Those working with the program are most affected because their appointments are terminated. The program leadership subsequently developed new criteria for the field centers where they would be established in a community for a 4-year period, after which time, it would close and open elsewhere. This decision changed the process where a field center remained open in a region until limited student enrollment or other major limitations such as reduced access to university arts/science courses necessitated closing a center. However, the critical criterion or value for opening a 4-year field center was reinforced: a partnership with an Aboriginal community or Aboriginal organization. Community spirit and community partnerships contribute immensely to knowing and understanding Indigenous knowledge systems.

Indigenous Knowledge Shapes Learning

Besides the NITEP logo and story, an Indigenous holistic learning model is another guiding framework for NITEP (Fig. 3). Indigenous holistic learning involves developing the spiritual, emotional, physical, and intellectual aspects of our human development. Because Indigenous knowledge is often relational and interdependent, the aforementioned four realms are distinct entities, yet they often influence each

Fig. 3 NITEP holistic model

other. The principle of interrelatedness extends to the circles of responsibility and interaction that embrace one self, one's family, one's community, and the wider world (Archibald 2008). Specific examples of how NITEP exemplifies this holistic model will be pointed out below.

Two or three Indigenous education courses are taken in each year of the NITEP degree program, which form an Indigenous education specialization. This specialization could constitute the intellectual realm, and it could also address the spiritual, emotional, and physical realms. NITEP instructors need to understand this dynamic and interrelated nature of the holistic framework. NITEP has control over the course content and selection of Indigenous faculty to teach its courses, thereby ensuring the cultural responsiveness of the holistic learning model. These courses include introductory courses about the history and current issues of Aboriginal people in Canada and British Columbia, Indigenous knowledge and pedagogy, Aboriginal educational history and policy, Aboriginal curriculum, and an advanced examination of current critical issues in Aboriginal education. NITEP also offers educational seminars in years 1, 2, and 3 in which Aboriginal educational approaches and community relationships are addressed. During these educational seminars, students learn to understand the dimensions of the model, and they are encouraged to apply it to their everyday living and to use it for their future learning and teaching. Student projects demonstrate these holistic understandings.

Indigenous people teach the Indigenous education courses, which is another fundamental principle of NITEP. It is a critical aspect of professional modeling and mentoring for NITEP students to learn from Indigenous educators who have completed their BEd degrees and, most importantly, to learn from faculty members that have a critical consciousness about the impact of colonization and the need to embrace transformative educational philosophies and practices. Many of these instructors have been NITEP alumni, so they provide added relevance and authenticity to the topics.

During these courses, NITEP students, as a caring cohort, have opportunities to explore and develop their cultural identities (spiritual), to heal from the intergenerational trauma caused by the impact of residential schooling and assimilation of the public system (emotional), and to develop educational understandings/competencies and concrete educational resources that are based on Indigenous knowledges (physical). This holistic approach is a critical foundation for good quality teacher preparation.

Good Quality Teacher Preparation

One of the key values and principles that the NITEP founding group developed was that this program would be of high quality; therefore, at minimum, it had to be a degree program, for which the university was responsible for offering annually. Two other requirements were that NITEP build upon Indigenous students' cultural heritage and knowledge and that Indigenous people have decision-making authority. Together, these requirements constitute the basis of the value about good quality

teacher preparation. One of the founders, the late Robert Sterling, a highly respected educational leader gave a keynote speech in 1983 and related NITEP's success to these values:

Programs in which Native people have been actively involved in the planning and throughout the developmental phases have shown the greatest success. Among these, our Native Indian Teacher Education Program, NITEP, stands at the forefront of our successes. The program is an Indian idea, is Indian-controlled and its philosophy is Indian, although the program falls under the jurisdiction of the University of British Columbia. (cited in Archibald 1986, p. 33)

Being under the jurisdiction of UBC has created both opportunities and challenges for being a good quality teacher education program. One major challenge related to the degree requirement process will be discussed next.

NITEP ensures that the core degree requirements are met, which means that required courses and practica are offered to its students. In order to have space for the Indigenous education concentration, elective course space is used for this purpose. If needed, negotiations are carried out with the Faculty's Teacher Education Office for accepting some NITEP courses in lieu of some teacher education requirements.

Two major programmatic shifts have occurred to the UBC Faculty of Education's BEd degree requirements that resulted in substantial changes to some of the NITEP courses and program requirements. In 1987, an equivalent of 1 year of arts and science courses was added to the degree requirement, which meant that NITEP moved from being a 4-year to a 5-year degree program. This was a very difficult change because it meant that students had to spend an additional year at the university creating extra financial difficulties for them. NITEP also had to strengthen its relationships with regional post-secondary institutes so that students could access and take these courses at local colleges and universities. In remote rural areas, students often had to take online courses unless an Indigenous educational post-secondary institute was able to offer some of these courses. In 2012, another major change reduced the number of required arts/science and education courses, introduced an inquiry approach throughout the teacher education program, and required that all teacher education students complete an Aboriginal education course. NITEP returned to a 4-year (plus one term) program. The course reduction also reduced the number of Indigenous courses that NITEP could offer. Substantial revisions were made to all of NITEP courses. Even though revisions to these courses occur fairly regularly, these revised degree requirements meant that NITEP lost one of its courses, reduced the total hours for the educational seminars, and restructured some of its Indigenous education courses and educational placements.

Ensuring that NITEP students connect to, learn from, and contribute to Aboriginal communities and organizations is part of the value of good quality teacher preparation. An additional way for these community connections to be realized is through the educational placements/practica that students complete at the field centers. In each of the 3 years, 10 days of educational placements is completed in settings that may be a school but can also be an early childhood education program, Aboriginal cultural center, language program, Aboriginal Friendship Centre, or

Aboriginal youth program. NITEP students learn about the various dimensions of education and being a professional educator as well as establishing community relationships. NITEP students complete 13 weeks of school practica in their final year.

Discussion: Raven's Turn

The enactment of the following *Indigenous values* is a vital part of the history, ethos, epistemology, pedagogy, and structure of NITEP: (1) a sense of community/family within the student body and faculty/staff, (2) its community-based relationships, (3) the importance of Indigenous knowledge systems for teacher preparation, and (4) good quality teacher preparation. The descriptions of the values and the ways that they formed the identity and actions of those involved with NITEP as leaders, students, faculty, staff, and community partners were briefly presented above. Elders' teachings and Indigenous stories, such as the Raven and the Sun, are additional ways that values continue to guide learning and interactions in NITEP. Raven has been too patient for much of the chapter, thus far, and believes that it is time for Raven's perspectives.

Well, it has been very hard for me to wait until now to speak... imagine me sharing the spotlight with the NITEP Sun! Jo-ann's letter to her grandfather mentioned Coyote, but there is definitely no room for Coyote on these pages. I think it is time that those working and studying in NITEP become the Raven or at least think about what they do as Raven-work. I have to admire the vision and foresight of the NITEP founders for setting up a whole degree program for Indigenous people wanting to become teachers. They worked very hard to ensure that the program was different- they challenged the 'status quo' as I have often heard Maori scholar, Graham Smith say and they developed a program that was Indigenous. I like what that fella, Robert Sterling said earlier, 'NITEP was an Indian idea and Indian-controlled' (Archibald 1986). He also said that it fell under the jurisdiction of the university so that the university Senate had to approve it at a time in the 1970s when university programs aimed to assimilate Indigenous people to mainstream thinking and doing. The dean at that time used his leadership role, influence, and stubbornness to ensure that NITEP was officially approved (read More 2015 for more). What I admire most is that I, the Raven was chosen as the central figure for the NITEP logo, with me holding the Sun in my beak. It was not easy bringing the sun to the people who were living in darkness, but it was worth all my effort.

In my travels throughout British Columbia over the years, I have kept watch on the various NITEP field centres. I fly over the sites and admire those where Indigenous community members are helping to find future NITEPers, giving substantial feedback about the program, and providing community support for the students. Once in a while I spot a centre where the relationships between the community and NITEP don't seem to be active, so I figure it is time to change that or find another location, after all, if the centres are not thriving with students and not developing the community spirit, then my role is in question. I didn't like the change

of only having centres in communities for four years, but now, I think it is ok. I remember when that change happened and NITEP sent out a call for proposals for a new centre throughout the province and the demand was amazing. It perked me up and showed that my popularity had not waned. But now, I have to keep travelling around the province to find potential sites and community partners.

My favourite way of spending time is going to the various NITEP gatherings at the field centres and the UBC Vancouver campus. There is always lots of good food, laughing, songs/drumming, stories being told, people talking to one another, and of course they always mention the Raven and how I brought them the Sun. They always talk about family, extended family, community, caring, and sharing. I know that the students value these types of family and community gatherings. I wonder how some students continue in the program with tragic experiences such as deaths in their families, surviving house fires, having their funding greatly reduced or eliminated, or experiencing forms of racism from instructors or other non-Indigenous students. Maybe it is the caring love that they receive from each other, the advocacy and support from NITEP coordinators/faculty and staff, and others that keep them coming back. Sometimes, students will leave the program to work on their personal and other issues. But they often return to complete their program. They are lucky to have Indigenous Elders and those who know about culture guide them through their studies and their development of a sense of community- it means less work for me.

Speaking about Indigenous knowledge, I am sure glad that the NITEP leadership keep finding ways to strengthen the ways that IK shapes students' learning, identity, and keeps challenging them to make their teaching more Indigenous, even though they also must learn whatever a teacher needs to know. After all, I, the Raven and stories about me are a central part of IK systems. One thing I have noticed is that more of the younger NITEP students seem to know little or nothing about their Indigeneity, which is different from earlier times when more NITEP students entered the program who spoke their Indigenous language and who knew their culture. It is a shame that many of these younger students were denied that IK in their schooling and their families/ancestors were subjected to colonial policies that forbade cultural practices, Indigenous language, and fostered family/community separation through Indian residential schools and took many Aboriginal children away from their families and put them into foster care or put them up for adoption. Good thing that the Truth and Reconciliation Commission of Canada (2015) put national attention to the intergenerational impact of these schools and colonial policies. Even though some of these NITEP students may not know much about their Indigenous background, once they begin to learn about Indigenous history, education, policy, and culture they come alive, sometimes with anger, and other times they wrestle with developing ideas about how they will work with Indigenous students, families, and communities and even with non-Indigenous students and others in order to have better relationships with each other. That big word, reconciliation, is probably what they are trying to understand and live. I really think that non-Indigenous people need to become more active in what I have heard some call a 'reconcili-action process' that emphasizes doing as well as talking. This responsibility should not be only for Indigenous people. What makes me happiest

is that IK (and me) are not put on the outer circle – in the margins of NITEP as a teacher education program – we are firmly in the middle.

Another issue that I wanted to talk about relates to that value of being a good quality teacher preparation program. I know that a common mis-belief is that NITEP is not as good as the 'regular' or 'mainstream' teacher education because it is an Indigenous program. I think that other Indigenous teacher education programs face the same type of systemic racism (Martineau et al. 2015). Recently, I read about something called the 'racism of low expectations' that was in the BC Auditor General's report (2015), which reviewed Aboriginal education in BC's K-12 public school system. This school system did not get a good report card about Aboriginal education from the Auditor General. This term meant that educators viewed Aboriginal students as having deficits in their learning abilities and that their home/community situations were responsible, so they placed low expectations upon these children, which could contribute to Aboriginal students being over-represented in special education designations and having lower academic progress. Maybe the racism of low expectations extends to Indigenous programs at post-secondary too. Well, I want to confront that form of racism by reinforcing the strength of a program such as NITEP. It should be considered a value-added program that not only prepares its students to become teachers through a degree program at a highly reputable university, but it builds upon and strengthens important IK values through its holistic approach so that students develop strong hearts, minds, bodies, and spirits to enable them to become effective educators. Well, that was a lot of what was in my mind and heart, now I need to rest and get rejuvenated for the next journey and story. I'll let Jo-ann get to some other challenges.

Challenges

One purpose in creating NITEP was to increase the numbers of certified Indigenous teachers in British Columbia. To date, 400 Indigenous people have completed their BEd degree and gained professional teacher certification through NITEP. This is still a small number compared to the overall need. In BC, there are currently nine Faculties of Education offering BEd degree programs. Until recently, NITEP was the only Indigenous teacher education program in the province. The University of Victoria established a Bachelor of Education in Indigenous Language Revitalization in 2011 that is community-based for the first 2 years. NITEP continues to have the largest enrollment of Indigenous teacher education students with approximately 60–70 per year in the last 5 years. However, at the start of the 2017 academic year, 91 students were enrolled in NITEP (personal communication with NITEP staff, October 31, 2017).

In 2016/2017, the only data that exists about the numbers of Aboriginal teachers teaching in BC public schools is noted in the British Columbia Teachers' Federation (BCTF) Fact Sheet (September 2017), as specialist teachers that total 205. The definition of "specialist" is not given, nor is there any information about how this term relates to enrolling and non-enrolling teachers, which usually means teachers

who teach a classroom of students (enrolling). The total number of enrolling and non-enrolling teachers in BC was 30,466 in September 2017. This data is presented to show the exceptionally low numbers of Aboriginal teacher data in comparison to the overall teacher population. Some professional groups such as the Association of BC Deans of Education (ABCDE) started in 2015 to gather data about the numbers of Aboriginal teacher education students enrolled in Faculties of Education, as well as qualitative data about programmatic services, structures, and Indigenous faculty related to Indigenous teacher education students (ABCDE, 2017). However, the ABCDE information has not been reported publically. The fact remains that there is no ongoing mechanism to gather and report on the numbers of Aboriginal teacher education students or Aboriginal certified teachers. Why is such data necessary and important? The numbers could indicate the actual gap of Indigenous professionals in this important field, and then further systemic issues could be examined in order to identify and understand barriers that prevent Indigenous people from becoming certified teachers. Increasing the numbers of Aboriginal teachers in BC and across Canada has become a priority for many Aboriginal educational organizations, educational professional associations, and provincial and federal governments (Council of Ministers of Education, Canada 2015).

Acquiring Indigenous educational competencies has become stronger expectations of NITEP students. Often these are referred to as developing “Indigenous heart and mind” competencies derived from the holistic learning and Indigenous values that have been discussed in this chapter. Based on the experiences of alumni and other Indigenous educators, the following expectations or competencies are the ones that they have experienced that are beyond everyday classroom teaching: (1) advocacy and leadership roles for improving the success of Indigenous K-12 learners, (2) making systemic change to ensure Indigenous knowledge is meaningfully included in curricula and policy, (3) sensitizing/educating educational colleagues about the impact of colonization upon generations of Indigenous peoples, and (4) assisting colleagues with introducing Aboriginal perspectives to K-12 curriculum (Castagno et al. 2015; Hare 2015; Martineau et al. 2015). These additional professional expectations need to become part of the heart and mind educational competencies. Students develop some of these competencies in their NITEP coursework; however, those working with NITEP have not yet developed a program-wide assessment rubric for these Indigenous heart and mind education competencies. This rubric is an important future cooperative activity that needs to be undertaken by NITEP and other teacher education programs in order to acknowledge and prepare Indigenous teacher education students for these additional roles and responsibilities. These value-added competencies may alleviate the racism of low expectation and systemic racism that was discussed earlier.

Another competency consideration and challenge for NITEP students is to develop critical community consciousness. During NITEP courses, students often talk about the community-based difficulties they witness such as poverty, lack of social cohesion, political divisions, lateral violence, and various social problems. Through their coursework, they are able to understand how these issues are part of the colonial legacy. Yet, they must think about and develop strategies for how they

will deal with these issues once they are teaching in the community. Students often talk about how they want to make positive community-oriented changes through education, and many do teach in Indigenous schools based in Indigenous communities or work in public schools in Aboriginal education roles. They are challenged to think of ways to encourage Indigenous parental engagement with education and the school. They are challenged to think of ways to build better working relationships between the parents, community leaders, and the school educators. In 2015, I taught an Indigenous curriculum course to third-year NITEP students and share my reflection that illustrates the development of a critical community consciousness in a “safe” university class environment:

In one session we talked about using Indigenous traditional experiential learning as a form of pedagogy. The topic of teaching Indigenous language came up. One of the students recalled the way her Indigenous language was taught by a community member, which included fear, punishment, focus on grammar, and segmenting the language. She also remembered learning traditional food gathering from her grandparents by watching and doing, where they gave encouragement and showed a caring positive approach. This student then understood that the language teacher was teaching in a similar way that she was taught in the residential school, but instead of a school subject, it was the Indigenous language that she was using. This teacher did not have the opportunity to learn other ways to teach language nor did she have the encouragement to think of Indigenous ways of teaching the language. This discussion was an ‘ah-ha’ moment for the NITEP student. Coincidentally, she was taking an Indigenous language course at the university and she was able to think more deeply about Indigenous ways to teach and to learn other methods of teaching a language. She thought about land-based experiences that could include language learning. I think the most important part of this session was that the students could talk openly about the negative teaching experiences that they shared where they would not say these things in class of non-Indigenous students; at the same time, they knew that they could teach in a different way, using Indigenous knowledge to guide them.

Raven Takes Flight Once More

I am rested and ready to travel once more. I hope I get invited to the next annual Indigenous teacher education symposium that I am quite proud to say was started by NITEP in 2013. The NITEP leadership had been a coauthor of the 2010 Canadian Association of Deans of Education (CADE), *Accord on Indigenous Education*, in which Faculties of Education across Canada committed to increasing the numbers of Indigenous educators, expanding Indigenous knowledge approaches, working with Aboriginal communities in research, and increasing non-Indigenous teacher education candidates’ knowledge about Aboriginal education and more (CADE 2010). One project that is supported by CADE is this Indigenous teacher education symposium. NITEP leadership started this annual gathering to bring more local and national attention to Indigenous teacher education so that those working in teacher education programs across the country would have a forum to share their programs, approaches, successes, and challenges. This type of gathering is one way for various community groups associated with Indigenous teacher education to learn from one another, to create alliances, and to learn about wise practices in order to improve their programs. I am very glad because it means less work for me, plus I get more attention during these gatherings. Perhaps an international Indigenous teacher education symposium might be next?

Conclusion

Educators with Indigenous community heart and long-term vision acted on their values to make a systemic change to teacher education and Indigenous education within a mainstream university. Believing in the importance of community-based programs, culturally relevant education, and highly credentialed Indigenous educators led to the development of NITEP over 40 years ago. Each year, those who work with and study in NITEP are challenged to live the values such as extended family and community relationships, Indigenous knowledge as a foundation for learning, and good quality education to put them into action throughout the degree program, despite issues such as systemic racism and the intergenerational impact of colonization that confront them. At the same time, these values create transformative educational opportunities that enrich individual and collective Indigenous identities and facilitate the development of Indigenous educators ready to bring light to the world. Two NITEP student perspectives close this NITEP case story. They have recently graduated with their BEd degrees and are starting their educational careers. Each year, NITEP students contribute personal reflections, stories, and poetry to the annual NITEP Newsletter. These two students have lived the NITEP values as mentioned above, and they have made them their own. They also have made Raven happy by expanding Raven's values, story, and impact. They recognize the importance and impact of Indigenous teacher education programs such as NITEP.

Claire Shannon-Akiwenzie, of Anishinaabe-kwe/Chippewas of Nawash, Ontario, wrote the following article when she was a third-year student:

[The term, kobade, an Anishinaabe word]. . .reminds me of the inextricable connection I have to my ancestors, a connection that I didn't feel could exist academically as recently as three years ago, before coming to NITEP. This severed sense of connection was the result of an education system that has underrepresented and misrepresented Indigenous people. In school, I felt that my First Nations heritage was irrelevant and unimportant because we rarely learned about it and if we did, I was made to feel as if I should hide it, as if it were only safe to celebrate in the comfort of my own home. Any link between education and Indigeneity was seemingly non-existent. The concept of this is powerful. Children spend more time in school than at home and for those students whose links and connections to their First Nations heritage have been kinked or severed in other aspects of their life, when does one have the opportunity to recognize that this chain exists and to rejoice that they are a part of it?

NITEP has given me the tools, the knowledge, the resources and the opportunities to recognize that I come from a chain of strong, intelligent, beautiful people who deserve that recognition in all realms of society including the current construct of academia. My ancestors created a strong foundation for me and I want to ensure I create a strong foundation for future generations. One way I may accomplish this is to be the link for my grandchildren and great grandchildren that acts as a conduit for Indigenous energy and knowledge that has flowed from past, to the present and into the future. (NITEP news 2014, p. 12)

Crystal Smith de Molina, of BC Tsimshian and Haisla ancestry, was a fourth-year student when she wrote this poem in consideration of NITEP's 40th anniversary. Crystal is nearing the completion of her Master of Education degree, with an Indigenous knowledge and educational leadership emphasis in the UBC Faculty of Education.

Echoes of our Ancestors

It is in our legend
That Raven brought light to this world
He brought light to this world because he has seen
Seen the sorrow of the people living in darkness

The only way Raven was able to get the light
Was to become part of the family
So Raven was born
Raven was born
Born in the family
Became family

Soon Raven had given the people
The stars and the moon
And through the burning of his feathers
Raven brought the sun

It is so comforting
That this story has been chosen
To represent NITEP

It is our history
That NITEP brought light to this world
Brought light into this world because NITEP had seen
Seen the sorrow of the people living in darkness

The only way NITEP was able to get the light to the people
Was to become part of the family
To become part of this colonial education
So NITEP was born
Born in this family
Became family

Soon NITEP brought the stars
Sprinkling light across the sky
Sprinkling hope
Hope for change

NITEP then brought the moon
The moon reminds us
That even in darkness
We will have light

Finally through the pains of growth
40 years of growth
NITEP brought the sun
And continues to spread the light
Continues to spread hope
Continues to spread wisdom
And will continue for 40 years and more.
(NITEP News 2014, p. 12)

Claire and Crystal have experienced the intergenerational effect of having their Indigenous culture and knowledge denied through educational policy and law (Battiste 2013; Royal Commission on Aboriginal Peoples 1996; Smith 1999; Truth and Reconciliation Commission of Canada 2015). Yet, they were fortunate to have an Indigenous teacher education program, such as NITEP, available to them so that they could develop and build upon their Indigenous culture/knowledge as a core component and expectation of their program, which non-Indigenous teacher education programs cannot offer.

In Canada and elsewhere, Indigenous teacher education programs began in the 1970s. Some still exist today despite funding challenges and systemic racism (Archibald and Hare 2016; Castagno et al. 2015). The expertise of these programs for offering Indigenous courses and student support could be shared with non-Indigenous teacher education programs to help them with a systemic change that is beginning to take place in Faculties of Education in Canada and elsewhere (Archibald and Hare 2016). A required Indigenous course or modules are now offered to all teacher education students in many teacher education programs (Hare 2015). This small but significant change to teacher education programs is a beginning step to create awareness about Indigenous knowledge, impacts of colonization, and culturally responsive curricula and pedagogy for all teacher education students (Tanaka 2016). Raven wonders: what else those who lead and teach in universities, faculties of education, and teacher education programs could do to make higher education more attune to the 4Rs of respect, responsibility, relevance, and reciprocity that were mentioned earlier in this chapter (Kirkness and Barnhardt 1991)?

I retired from UBC in June 2017 with many good stories and memories of working with so many dedicated NITEP students, faculty, and staff. The challenges discussed above have made me a better educator who values the expertise, tenacity, and commitment of those who created pathways at the university for me to use. I have tried my best to make these pathways stronger and to create new ones too. Even though this chapter has focused on Indigenous teacher education and Indigenous educators, it is important to recognize that Indigenous teachers are one important component to improving Indigenous education, but they are not the only answer or strategy. But, I feel content knowing that our collective Indigenous teacher education work will continue with the next generation of Indigenous scholars and non-Indigenous allies. Of course Raven will be involved in some way.

Abstract

Contrasting the harmful policies and approaches of Western assimilationist agendas, Indigenous education aims to build on and enhance the linguistic, cultural, cognitive, and affective strengths possessed by Indigenous students. Indigenous culture-based education (CBE) often includes efforts to revitalize languages, knowledge, practices, and beliefs lost or suppressed through colonization or occupation. These approaches are consistent with the concept of cultural advantage, revealing “funds of knowledge” where others have only seen deficits. Reframing Indigenous identities as cultural advantage creates counterhegemonic opportunities by giving voice to the expertise of elders and other cultural sources of community, familial, and individual strengths. This study presents Mālama

Honua Worldwide Voyage as a powerful application of indigenous knowledge to inspire and catalyze positive change on a global scale for the earth now and for our future.

Keywords

Cultural advantage · Culture-based education · Hawaiian · Mālama Honua

Introduction

In the early Spring of 2017, the traditional Hawaiian sailing canoe, Hōkūle‘a, traveled from Panama to the Galapagos Islands. It was year 3 of a 4-year endeavor to circumnavigate the globe, called Mālama Honua Worldwide Voyage (see www.hokulea.com). The entire 4-year ocean voyage, across more than 60,000 nautical miles, was performed without any modern navigational tools, guided only by indigenous knowledge of celestial navigation, using stars, sun, winds, swells, and other natural elements. There were no sextants, no compasses, no GPS, computers, or cell phones used to navigate the canoe around the earth. As crew member and educator on the canoe, our arrival to the Galapagos islands represented a significant milestone on this journey, reflecting the deep interconnections between science, humanity, and culture playing out in this unique environmental landmark.

Stepping back, the Mālama Honua voyage is a story of Indigenous education, bringing people together across the globe on a journey to learn and care for “island earth.” It recognizes the value and need for both indigenous *and* modern science, wisdom, and technology to solve the most complex issues of contemporary society today and tomorrow. Mālama Honua translates most simply to caring for the earth in Hawaiian language. This commitment is guided by ancestral values-based knowledge and practices developed through keen observation about island living. It calls people together to learn about the relationships between each other, our oceans, our lands, and everything in or on them. The lessons from life on a canoe are the same as those necessary to surviving on remote islands in the Pacific, whether it’s working collaboratively, using natural resources wisely, or applying ancestral and modern knowledge and science to solve complex problems – like how to navigate across thousands of miles of unfamiliar oceans and build relationships with unknown places and peoples. These same skillsets, mindsets, and values are those needed to create a healthier future for the earth.

“When we care for the earth, we care for each other.”

This chapter introduces cultural advantage as a driving framework in education, one exemplified beautifully by the Mālama Honua Worldwide Voyage. In addition to catalyzing global action around urgent environmental issues, the voyage is a modern day feat of applied indigenous knowledge. From concept through implementation, the undertaking and all that it signifies is a window into a unique indigenous

epistemology, culture, and values deeply rooted in ancestral wisdom, experience, and sense of place. It is a proof point demonstrating the power of embracing cultural diversity as an advantage for the betterment of humanity. I first review cultural advantage as a framework within the broader sociopolitical and educational forces underlying indigenous and culture-based education (CBE), then discuss research on the impact of CBE on students and communities before turning to Hawai'i's story and the Mālama Honua voyage as place-based examples of positive impact.

A key purpose of Mālama Honua is to catalyze educational transformation. Many of the volunteer crew members are educators, scientists, and community members challenged by critical questions about the education children experience in today's school systems. Is it the education they deserve, which best prepares them for the future? What will they need to know and do? In each global port, Hōkūle'a and crew welcomed the chance to share the message of Mālama Honua with children around the world and at home in the Hawaiian archipelago. In a Hawaiian worldview, human life exists in deep kinship with the ocean and natural world around us, reflecting firmly held values common to most Pacific peoples. Some see the ocean as a boundary separating humanity, but in Indigenous eyes, the ocean is an abundant life-giving force that connects us all, through every breath we take. And, unfortunately, its current fragile state reflects more consumptive views of ocean as human dumping ground, now requiring urgent care and action because without the ocean, there is no life. The belief behind Mālama Honua is that when we care for the oceans and the earth, we care for each other. In many ways, understanding this cultural wisdom is paramount not only for indigenous children, but for all children, to learn and practice.

Mālama Honua is an example of how the voices and leadership of indigenous discoverers, educators, and community members inspire the field to reexamine the structures, paradigms, and practices of effective education. The ideas and research presented in this essay build on the shoulders of many who have contributed to this undertaking, including my CBE research collaborators from Kamehameha Schools and Nā Lei Na'auao Hawaiian Native Charter School Alliance, and with deep respect for the service of leaders like Nainoa Thompson, the captains, and entire crew of the Polynesian Voyaging Society, 'Ohana Wa'a, and the Worldwide Voyage who share their wisdom with the world. Elsewhere my colleagues and I argue that cultural and indigenous knowledge have gone unrecognized too long in mainstream education. Recognizing cultural assets as advantages in education changes forever the landscape of knowledge and action. A challenge for all educators, whether indigenous or not, is to critically scrutinize and counter the way conventional education systems perpetuate systematic inequities in opportunities and outcomes afforded to certain groups in society, in effect curtailing cultural and linguistic diversity and innovation that could benefit the earth and all its inhabitants (Kana'iaupuni et al. 2017; Abt-Perkins and Rosen 2000).

In effect, this call for equity challenges educators and policymakers around the globe to interrogate educational paradigms and practices from the standpoint of Indigenous and minoritized populations who differ linguistically and culturally within Western-based power structures. Educational progress will come from

forward-oriented research and leadership that embraces the cultural advantages of communities with diverse experiences of racism, poverty, cultural trauma, and oppression. Empirical research conducted in Hawai'i and in other places indicates that learners thrive with culture-based education (CBE), especially Indigenous students who experience positive socioemotional and other outcomes when teachers are high-CBE users and when learning in high-CBE school environments (Kana'iaupuni et al. 2017). By cultivating culturally vibrant and affirming learning environments in lieu of "one-size-fits-all" approaches, educators honor assets found in Indigenous knowledge, values, and stories as models of vitality and empowerment for all. Now with much greater environmental and human urgency at stake than ever before, this next decade marks a highly significant inflection point to transform education.

Shifting the Paradigm: Cultural Advantage as an Educational Framework

Mohala i ka wai ka maka o ka pua

Unfolded by the water are the faces of the flowers, flowers blossom in good conditions

The concept of cultural advantage is highly relevant to Indigenous peoples across the globe seeking to redress significant social injustices experienced through colonization (All Hawaiian proverbs in this chapter are found in Puku'i (1983)). It is an example of "flipping the narrative," a tool used in Indigenous critical pedagogy to interrogate the status quo (Grande 2008; Kaomea 2003, 2011). Rooted in critical theory and pedagogy (Apple 2013; Giroux 2011), Indigenous critical theory unveils the seemingly invisible power relations at work within education but from the standpoint of Indigenous community, self-determination, and sovereignty (Brayboy 2005; Goodyear-Ka'ōpua 2013). This standpoint reverses the "Western gaze," offering a lens to challenge the way conventional educational approaches erase the lives of some and privilege others and also to position Indigenous ways of knowing and being as cultural advantages rather than deficits.

The United Nations (2009) counts more than 370 million peoples in 90 countries that are "Indigenous on account of their descent from the populations which inhabited the country, or a geographical region. . . at the time of conquest or colonization or the establishment of present state boundaries and who irrespective of their legal status, retain some or all of their own social, economic, cultural and political institutions" (C169 Article 1, International Labour Organization 1989). In Indigenous experiences, schooling systems have used colonizing and assimilationist policies designed to erase Indigenous cultures and languages, systematically marginalizing the identities of Indigenous children in the name of progress (Benham and Heck 1998; Lipka 2002; Ogbu 1982; Lomawaima and McCarty 2006; Skutnabb-Kangas and Dunbar 2010; Wilson and Kamanā 2006).

In response to the harmful policies and approaches of these agendas, Indigenous education aims to build on and enhance the linguistic, cultural, cognitive, and

affective strengths possessed by Indigenous students. Indigenous culture-based education often includes efforts to revitalize languages, knowledge, practices, and beliefs lost or suppressed through colonization or occupation (Demmert and Towner 2003). These approaches highlight the assets of their students and communities, revealing “funds of knowledge” where others have only seen deficits (Gonzalez et al. 2005). Reframing Indigenous identities as cultural advantage creates counterhegemonic opportunities by giving voice to the expertise of elders and other cultural sources of community, familial, and individual strengths.

In this vein, we must challenge ourselves to name, conceptualize, and narrate these advantages using Indigenous languages, stories, and values (Kana‘iaupuni 2004). Yosso’s (2005) model of community cultural wealth identifies the significant cultural assets available to students of color, (re)framed as linguistic, familial, and resistant capital. Goodyear-Ka‘ōpua’s (2013) account of sovereign pedagogy in an Indigenous public charter school in Hawai‘i provides a living example of cultural advantage used as an educational framework to guide how students see themselves as change agents in present-day political, media, and community contexts. Seeing culture as advantage drives intentionality, prompting educators to deepen their efforts, because “when we invest our multicultural energies in surface-level cultural exchanges, fantasies of color-blindness, or celebrations of white-washed heroes while ignoring the actual inequities many of our students face, we demonstrate an implicit complicity with those inequities” (Gorski and Swalwell 2015, p. 40).

Behind the Stage: Sociopolitical Context, Tensions, and Dilemmas

‘O nā hōkū nō nā kiu o ka lani
The stars are the spies of heaven

Indigenous CBE sees educational systems embedded within broader sociopolitical contexts, where culture and identity are deeply contested arenas in the politics of European and US nationalism (Kana‘iaupuni et al. 2017). Institutionalizing a single, common language and culture is an all too familiar tool of those in power. Mass education plays a critical role, significantly differentiating the experiences of those living the drama by prescribing the dominant group’s language and culture as the script for all groups, while delegitimizing and silencing potentially competing languages and cultures (Goodyear-Ka‘ōpua 2013; Kana‘iaupuni and Ledward 2013; Spring 2016). The process is eerily invisible and oftentimes people forget (or dismiss) that what is considered knowledge in modern societies, and how it is transmitted, can vary considerably among cultural groups. For example, a big wake-up call came when Native peoples dared protest the use of respected American Indian icons as mascots in sports, prompting national debate and sometimes outrage. Ironically, the misuse happened within the very institutions purporting to educate American Indian students to fully participate in the modern world (see Staurowsky 2007).

Vigilance is required, and the record shows much can be gained when educators challenge institutions, seeking greater diversity of knowledge (Apple 2013). Owing to these voices, multicultural education became widely accepted in the 1990s throughout the United States and other Western countries, albeit not without challenges (Glazer 1997). Continued resistance to the idea reflects the tug between national cohesion and power versus cultural and linguistic diversity, known as the “pluralist dilemma” (Bullivant 1981; May 2014).

Political answers to this dilemma include, on one end, corporate pluralism, which allocates economic, social, and political awards to minority groups based on size and influence, and liberal pluralism on the other, under which no national or ethnic minority group possesses separate standing before the law. According to May (2014), most nations champion the latter. Efforts to protect minority cultures are often portrayed as “irremediably unjust, a disguise for creating or maintaining. . . ethnic privilege” (Kymlicka 1989, p. 4; May 2014). Cosmopolitanism advocates push the line beyond national boundaries, arguing for a universal global citizenry spurred by increasing transnationalism and standardization of experiences (Nussbaum 1997). In effect, these forces create pressure to universalize identity, threatening local diversity.

In Indigenous experiences, notions of a universal national or global identity as common good raise critical questions about profound social inequities perpetuated by education policies supposedly in service to that same common good (Wallerstein 1996). Greater value might be found in learning how to take or serve a global purpose through local identity and action. As presented in this chapter, the case of Mālama Honua is an applied example of this potential.

Building the Toolkit: Education as Individual and Collective Transformation

I ulu no ka lālā i ke kumu

The branches grow because of the trunk, a student is a reflection of the teacher

Clearly culture and language are volatile pivot points in the broad sociopolitical landscape. This knowledge is an important backdrop for understanding the purpose of education. By giving students access to the art and science of critical thought through diverse epistemologies or knowledge systems, including those of their own communities, education creates transformational opportunities for individuals and entire communities to change the world, and themselves, for the better.

Several schools of thought inform this argument. First, from a sociological perspective, education is the primary means to spread the norms, beliefs, and knowledge of society. It accomplishes the crucial task of cultural preservation by transferring knowledge to the next generation. The question is whose knowledge and for whom? How do we account for the data showing cultural-linguistic minority students are routinely denied access to elite academies, influential positions, and earnings enjoyed by the dominant group? Conventional schooling systems

reproduce inequities in power relations while also serving as a primary gateway to mobility and socioeconomic status in Western societies (Apple 2013; Bourdieu 1986). Education, especially higher education in this decade, while often viewed as the greatest equalizer in our society, is arguably also the greatest stratifier of our time (Reeves 2017).

Second, developmental perspectives focus attention on the processes through which education liberates the human mind through reflection and knowledge, in addition to freeing up access to socioeconomic rewards. Theories of learning stress the empowering role of educators who encourage students to reflect on their social world and develop their own refinements (Vygotsky 1978). Through this process, education brings about individual enlightenment and awareness of the self as learner and in relation to others. Social cognitive approaches emphasize the importance of developing self-efficacy in students, through which is gained a sense of empowerment and confidence in the ability to succeed (Mega et al. 2014; Weissberg et al. 2015; Lane et al. 2004).

As youth make their way through school, they develop self-awareness and identity, which in turn provides a foundation for growth, agency, and action in a global world. Banks (1991) traces the formation of identity through six stages of development (Table 1). Although transitions between stages are gradual and nonlinear, educational efforts may use multiple approaches. Sometimes schools unwittingly stop short of the most advanced stage which achieves global competency and action.

Social critical theories draw an even more definitive line connecting education and agency. Through education, students learn to critically reflect, question, and reason using scientific and experiential methods. Learning empowers students to engage in responsible personal action and to make changes in the conditions of their everyday life, to seek autonomy, social interdependence, truth, justice, and fairness (Edwards 2012).

For example, Shor (1992) describes emancipatory education as “a critical-democratic pedagogy for self and social change. It approaches individual growth as an active, cooperative, and social process, because the self and society create each other. . . The goals of this pedagogy are to relate personal growth to public life, to develop strong skills, academic knowledge, habits of inquiry, and critical curiosity about society, power, inequality, and change”(pp. 15–16). It is a multicultural pedagogy concerned for public welfare rather than self-centered gain. These ideas are consistent with certain aims of culture-based pedagogy in indigenous education, which seek to build the critical thinking and other skills for learners to discover their potential as positive change agents in their communities, locally and globally.

In Fig. 1, I show several progressive stages from reflective to agentic capacity development. The top half traces several internal, subjective steps, and the lower half describes major stages in the externalization of this developmental process in learning.

As shown in the figure, education encourages youth to see themselves as valuable actors capable of making improvements to broader society in the areas of justice and freedom (Andruske 2003). Education is about individual growth leading to collective social change. As a case in point, Mālama Honua voyage is a brilliant example

Table 1 Developing ethnic identity as global competency (Based on Banks 1991)

	Description	Teaching and learning implications
Stage 1: Ethnic psychological captivity	<p>Individual believes ideas, assumptions, attitudes about his or her ethnic group (class, gender) that are institutionalized within the society</p> <p>If ashamed, may respond in a number of ways such as avoiding contact with cultural group or striving for total assimilation even if different from culture of origin</p> <p>The more a group is stigmatized, the more they may experience psychological captivity</p> <p>Whether positive or negative, understanding is shallow</p>	Stage 1: Students are exposed to own ethnic/cultural group perspectives and info
Stage 2: Ethnic encapsulation	<p>The individual participates in his or her own ethnic/cultural (race, class, gender) group and believes them superior to other groups</p> <p>Participates in ideas that some groups are inferior and are ethnocentric</p> <p>Can become culturally isolated and unaware</p> <p>Understanding is incomplete</p>	Stage 2: Benefits students in learning about other ethnic/cultural groups and perspectives
Stage 3: Ethnic identity clarification	<p>Individual is able to identify personal attitudes and cultural/ethnic (race, class, gender) identity to reduce intrapsychic conflict</p> <p>Develops positive attitudes about own group</p> <p>Able to understand positive aspects of their ethnic/cultural group and those of others</p> <p>Ethnic (cultural, class, gender) pride is genuine, not contrived</p> <p>Has positive experiences with other cultural/ethnic groups</p>	Stage 3: Benefits students in developing emerging ethnic/cultural awareness and opinion
Stage 4: Bi-ethnicity	<p>Individual has a healthy sense of ethnic/cultural (class, race, gender) identity and skills/characteristics needed to participate successfully in more than one group</p> <p>Has a strong desire to participate in more than one ethnic/cultural group</p> <p>Many marginalized groups function on bi-ethnic level</p>	Stage 4: Supports students' deeper understanding of ethnic/cultural groups other than their own
Stage 5: Multi-ethnicity and	<p>Individual has clarified positive personal, ethnic, and national identifications</p>	Stage 5: Supports students to develop a global sense of ethnic/cultural literacy and to master

(continued)

Table 1 (continued)

	Description	Teaching and learning implications
reflective nationalism	Positive attitudes toward other ethnic/cultural (class, gender) and racial groups Able to function within several ethnic cultures within their nation Able to understand symbols, values, and institutions of several cultures within the United States, or more globally, and committed to multi-ethnic ideals	concepts about a large range of groups within the United States or globally
Stage 6: Globalism and global competency	All of stage 5 as well as ability to function within cultures in other parts of the world Ideal balance of ethnic/cultural (gender, class, race), national and global identifications, commitments, literacy, and behaviors Has internalized universalistic ethical values and principles of humankind and has the competencies and skills needed to take action within the world to actualize commitments	Stage 6: Engages students in being global agents of change and in understanding global issues

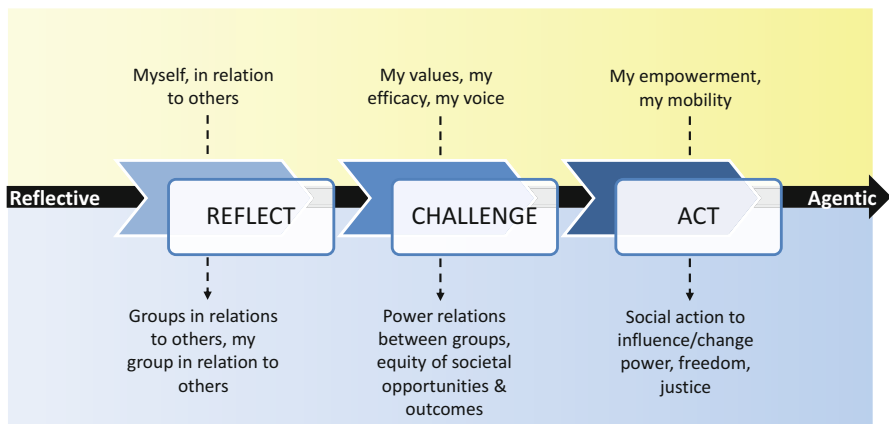

Fig. 1 Developing agency in youth

of individual actions to achieve urgently needed change on a global scale, an undertaking inspired by collective values of indigenous culture and identity.

These are not new ideas, but they somehow seem absent from current discussions in education. In Indigenous education, borrowing from Freire’s (1970) foundational

work, *Pedagogy of the Oppressed*, the most important process is awakening critical consciousness, attuning learners to the sources of human oppression and power, and disrupting the “culture of silence” that powerfully mutes the voices of the oppressed. To awaken learners is to empower them to interrogate racism, discrimination, and “blaming the victim” for outcomes beyond their control. In this endeavor, cultural advantage becomes a powerful tool for positive change and learning. As opposed to imposing the worldview and values of one cultural group on another, education should reflect mutual learning between educators and students. It is about building compassion and holding gracious spaces where students and teachers learn about and resolve contradictions between the worldviews of different cultural groups. The resulting environment becomes an enriching learning community where students and teachers are collectively responsible for learning and where cooperation and interaction are primary educational motives (Adams and Hamm 1994). In this learning environment, there are no spectators, no one who is charged with teaching, transmitting, or giving anything. “[T]he object of the actors’ action is the reality to be transformed” (Freire 1970, p. 180).

Transforming reality is a call to action central to Indigenous educators seeking greater well-being for their people and increased opportunities to preserve, protect, and apply cultural knowledge, tradition, and language (Demmert 2011; Grande 2008; Meyer 2008; Reyes 2013). The Mālama Honua Worldwide Voyage is but one healthy example of success, where Indigenous knowledge became a platform to create a coalition of hundreds of thousands of shared voices and hands inspired to take action to work together to protect the earth.

Sharpening the Focus: Cultural Advantage and Indigenous Education

‘A’ohe pau ka ‘ike i ka hālau ho’okahi

All knowledge is not taught in one school, one learns from many sources

Through the lens of cultural advantage, it is a limited common good that denies itself the full benefits of diverse knowledges. Recognizing this potential, a growing core of educational researchers and practitioners has called for culturally responsive pedagogies (see Table 2 – Kana'iaupuni et al. 2017). In the 1990s, research in this area focused primarily on racial and ethnic diversity (e.g., Gay 2000; Ladson-Billings 1995), suggesting now well-known, though still inconsistently used, pedagogies that authentically engage student cultures in learning by:

- Acknowledging the legitimacy of different cultural heritages
- Engaging children *through* culture and respecting culture as *content* worthy of learning
- Building meaningful bridges between home and school experiences and between academic abstractions and lived sociocultural realities

Table 2 Evolving approaches and aims of culture in education

Ways in which culture is integrated in education	Key aim
1. Invisible: All education is culture-based, typically reflecting an invisible Western cultural norm in the United States	Assimilation, protecting hegemony of western culture in education
2. Culturally appropriate: Cultural styles, competency, or sensitivity approaches emphasizing respect and tolerance for other cultures and ways of learning (Gutiérrez and Rogoff 2003)	Teaching tolerance and respect for diversity
3. Culturally relevant/responsive: Pedagogy and curriculum are culturally attuned and responsive to students' diverse cultural communities and experiences (Castagno and Brayboy 2008; Gay 2000; Ladson-Billings 1995).	#2, and Student engagement and positive identity formation; cultural diversity
4. Culturally sustaining: Pedagogical approaches supporting both traditional and evolving ways of cultural connectedness for youth (Paris 2012)	#2, #3 and Sustains linguistic, literate, and cultural pluralism as the democratic project of schooling
5. Culturally sustaining and revitalizing: Revitalizing connections to identity and mother language that have withstood colonization, ethnicide, and linguicide (McCarty and Lee 2014)	#2, #3, #4 and Rebuilds control over language, self-determination
6. Culture-based: Instruction and student learning evolving from the values, norms, knowledge, beliefs, practices, experiences, places, and language of a cultural group, e.g., Japanese, Jewish, Jesuit, or Hawaiian (Demmert and Towner 2003; Kana'iaupuni and Kawai'ae'a 2008)	#2, #3, #4, #5 and Transmits and applies cultural ways of being, knowing, and doing, past, present, and future

Source: Kana'iaupuni et al. (2017, p. 317S)

- Using a wide variety of instructional strategies to connect with different learning styles
- Teaching students to know and praise their own and others' cultural heritages
- Embedding multicultural information, resources, and materials in all subjects and skills routinely taught in schools

Reflexive, critical scholarship strengthens these approaches, seeing beyond culturally responsive pedagogy to one that will “perpetuate and foster – to sustain – linguistic, literate, and cultural pluralism as part of the democratic project of schooling” (Paris 2012, p. 95; see also Ladson-Billings 2014).

Indigenous scholarship sharpens the focus on social justice and self-determination, arguing that where culture and language have been lost or oppressed through colonizing forces, education, research, and theory must

embrace the purpose of restoring culture and identity to a healthy place (Castagno and Brayboy 2008; Goodyear-Ka'ōpua 2013; Meyer 2008; Reyes 2013). Thus, critical “culturally sustaining and revitalizing pedagogy” or CSR (McCarty and Lee 2014) centers on cultural restoration and self-determination, also spelled out in international conventions such as the UN Declaration on the Rights of Indigenous Peoples, Article 14 (United Nations 2009). Fundamentally, a culturally sustaining and revitalizing pedagogy is one that will “serve the needs of Indigenous communities as defined by those communities” (McCarty and Lee 2014, p. 103; see also Brayboy 2005).

The diverse cultural approaches and their primary educational purposes summarized in Table 2 range from assimilation (definition #1) to sustaining and revitalizing culture (#5) and culture-based education (#6). As one moves down the table, progressively stronger assumptions emerge regarding culture and education. Culture is the subject of a vast body of research (see Kroeber and Kluckhohn 1952; Eisenhart 2001). Native Hawaiians, like other Indigenous peoples, have been romanticized and racialized in ways that reflect a bounded sense of culture (Ledward 2007). Borrowing from Stuart Hall's (1980) notion of articulation, cultural identities are constellations of meanings emerging and evolving through specific sociopolitical histories. Identities are enacted through *connections* individuals make with other people, ideas, and experiences. This view recognizes the multiple positionalities that individuals and groups assume within Hawai'i's diverse social milieu while acknowledging deeper implications of colonization and occupation (Kana'iaupuni et al. 2017).

Most generally, CBE refers to approaches to teaching and learning evolving from (but not fixed in) the languages, values, norms, knowledges, beliefs, practices, experiences, and places that are foundational to Indigenous or other cultural groups (Kana'iaupuni et al. 2017). Fluidity of culture and ideas is central to this definition. As Ladson-Billings (2014) explains, “this notion of pedagogy shifts, changes, adapts, recycles, and recreates instructional spaces to ensure that consistently marginalized students are repositioned into a place of normativity – that is, that they become subjects in the instructional process, not mere objects” (p. 76).

CBE refers to approaches to teaching and learning evolving from (but not fixed in) the languages, values, norms, knowledges, beliefs, practices, experiences, and places that are foundational to Indigenous or other cultural groups.

As Indigenous peoples, our approach to Indigenous CBE recognizes, first, that:

- Educational systems are sites for power negotiation and potential liberation not just of individuals but of entire communities and nations.
- Knowledge tied to cultural heritage and language is essential to identity and self-determination.
- Desired educational outcomes are those useful and meaningful to local and Indigenous communities.

Second, Indigenous CBE practices education within local cultural contexts and in service to a community, based on the specific history, knowledge, and experiences of its people (Kana'iaupuni et al. 2017).

Third, Indigenous CBE is dynamic by design, ensuring cultural vibrancy (past, present, and future) through the *production, transmission, and application* of cultural knowledge, language, practices, values, and beliefs. Finally, it carries the broader educational imperative of inspiring children on a journey of self-discovery clarifying who they are and how they and their communities can impact the world (Kana'iaupuni et al. 2017).

Improving Practice: Research on CBE and Student Educational Outcomes

He puko'a kani 'aina

A coral reef hardens into land; beginning in a small way and gaining steadily until firmly established

Empirical research examining the impact of CBE suggests several findings consistent with a theory of cultural advantage. First, CBE is positively related to student socioemotional development and cultural affiliation based on studies showing Indigenous CBE increases individual and collective identity, building students' positive self-concept, resilience, and confidence (Borofsky 2010; Tibbetts et al. 2007). In turn, socioemotional development improves achievement and other key markers of a healthy, well-adjusted life. For example, among Filipino students, learning family genealogy is positively correlated with school performance, and speaking the heritage language negatively associated with substance abuse and depression (Guerrero et al. 2006). Phinney and Chavira (1992), Phinney et al. (1997) documents well-established positive relationships between higher ethnic identity and self-efficacy and finds inverse relationships with loneliness and depression.

Research evidence shows that culturally contextualizing education generates robust relationships and support from surrounding communities and families, resulting in students' increased sense of belonging at school (Castagno and Brayboy 2008; Kawakami 1999; Lee 2015; Yazzie-Mintz 2007). Studies reveal the strong pull of shared priorities for language- and culture-rich education in schools serving Indigenous communities, drawing in parents, youth, and community leaders alike (Demmert and Towner 2003; Luning and Yamauchi 2010; Yazzie 1999; Wilson and Kamanā 2006).

CBE can strengthen student engagement in learning, including their college aspirations. Prior research shows improved student engagement when educators flexibly “create collaborative and culturally diverse learning environments, adapt cultural patterns in classroom verbal interactions, and other cultural dimensions of reciprocal interaction and dialogic instruction” (Abt-Perkins and Rosen 2000, p. 254). Various case studies find related positive effects, including Indigenous

student gains in math, compared to matched control groups (Kisker et al. 2012; Lipka et al. 2005; Rickard 2005); improved math test scores with Native Yup'ik approaches (Adams et al. 2005); doubled achievement results among Pacific Islander university students taking upper-level mathematics courses (Furuto 2014); and superior Native and non-Native Alaskan student learning outcomes in urban and rural schools using culturally responsive curricula (Sternberg et al. 2005). A recent longitudinal study found that participating in an 8th grade culturally responsive course increased student attendance, GPA, and course credits earned in high school (Dee and Penner 2017).

Longitudinal studies are rare in this field, more are needed to increase knowledge and opportunities that strengthen and build on these promising directions in indigenous education. Taken together, the findings suggest individual, family, school, and community benefits from investing in culturally rich learning environments and educational approaches. Further research is essential to understand the conditions that engage student learners and methods to assess learning most effectively, the kinds of professional development supports that equip teachers with the skills they need to deliver CBE, and successful strategies to engage families and communities in the teaching and learning process. Empirical research in this area is mounting, but still limited, representing a critical area of need for Indigenous educators and researchers (Sleeter 2012).

Bringing It Home: Culture-Based Education and Native Hawaiians

Ua ao Hawai'i, ke 'ōlino nei

Hawai'i is in the brightness of day, it shines, brilliant. Hawai'i is in an era of education

With examples like Mālama Honua Worldwide Voyage, the story of Native Hawaiians and Western education is a promising example of resilience and progress in light of a darker sociohistorical past. Primarily fueled by the concern and passion of community members, parents, and advocates, culture-based education reform has been an organic solution to the chilling negative statistics that plague Hawai'i's indigenous and Pacific Islander children: high rates of poverty, substance abuse, juvenile deviance, criminal activity, teenage pregnancies, poor educational outcomes, domestic abuse, depression, and youth suicide.

As a cultural and linguistic minority group, today's Native Hawaiians share similar experiences with other indigenous and racialized minority groups in the United States. The unique cultural lineage of Native Hawaiians traces back to a thriving, vibrant Polynesian society that achieved highly sophisticated governance and knowledge systems to navigate and prosper in the Pacific. Hundreds of years after settling in Hawai'i, Western contact brought exposure to new diseases and drastic population decimation, reducing this traditional society to one-tenth its size (Nordyke 1989). Importantly, it also brought the codification of Hawaiian language. Shortly thereafter, literacy rates topped 90% within the Hawaiian population. A robust reading, writing, and publishing community in the Hawaiian language

quickly emerged, and the majority of teachers in the first schools in Hawai‘i were Native Hawaiians (Wilson and Kamanā 2006).

Over time, however, growing Western influence in Hawai‘i sought power through educational systems. The earliest missionaries that came to Hawai‘i used education as an effective colonizing tool. Following the overthrow of the Hawaiian kingdom, explicit policies prohibited using Hawaiian language in instruction in all public and in many private schools. In public education, this ban occurred shortly after Hawai‘i became a territory in 1896 by decree of Sanford Dole, who played a key role in the overthrow and was the first Education minister. The deep and lingering effects of this *de facto* ban on Hawaiian language cannot be overstated in regard to Native Hawaiian student outcomes (see Lipka 2002; Skutnabb-Kangas and Dunbar 2010). The impact was systematic in effect, remaining in place for nearly 100 years (Lucas 2000; Wilson and Kamanā 2006).

To protect their children, parents were forced to give up their language involuntarily, a phenomenon common to many indigenous groups, as documented by the United Nations’ Permanent Forum on Indigenous Issues (see <http://undesadspd.org/indigenouspeoples.aspx>). Children were punished for speaking their language at school, among many other examples of colonizing practices experienced by Native Hawaiian children and families with the introduction of Western schooling (Kana‘iaupuni and Ledward 2013; Benham and Heck 1998). It was not until 1986 that the state’s Board of Education approved an amendment to allow for “special projects using the Hawaiian language” (Lucas 2000, p. 11). The first Hawaiian language immersion public school (*kula kaiapuni*) was opened shortly thereafter and the revitalization of Hawaiian language through education continues to be a growing call to action for the indigenous community and its many supporters.

Past and current statistics on Native Hawaiian well-being attest to the enduring detrimental impact of this history and its related events (Kana‘iaupuni et al. 2005). Comprising one-third of annual births in Hawai‘i and about one-fourth of public school students, Native Hawaiian children attend schools that serve many other racial/ethnic groups, the next largest among them being White (or Caucasian), Filipino, Chinese, and Japanese. In public schools, aggregate Native Hawaiian student achievement levels lag behind these other groups by up to 30 percentile points. Rates of chronic absenteeism, dropping out, and grade retention are significantly higher among Native Hawaiian students, suggesting low levels of student engagement. Native Hawaiian children in special education programs are disproportionately high, whereas graduation rates are some of the lowest in the state. Not surprisingly, the percentage of Native Hawaiians completing a 2- or 4-year college degree is about half the state average, roughly 14% of recent high school cohorts (Kana‘iaupuni et al. 2005; Kamehameha Schools 2014).

Research examining the successes of Native Hawaiian students consistently indicates the benefits of innovative, CBE approaches in reaching the students other public schools have struggled to serve. Elsewhere, for example, my colleagues and I find that students whose teachers are more intense users of culture-based education have higher levels of student belonging (students express trust people in school, feel teachers care about them, and view people at school as family), more often apply

Fig. 2 Belonging, aspirations and relevancy of skills among Native Hawaiian students by intensity of CBE use

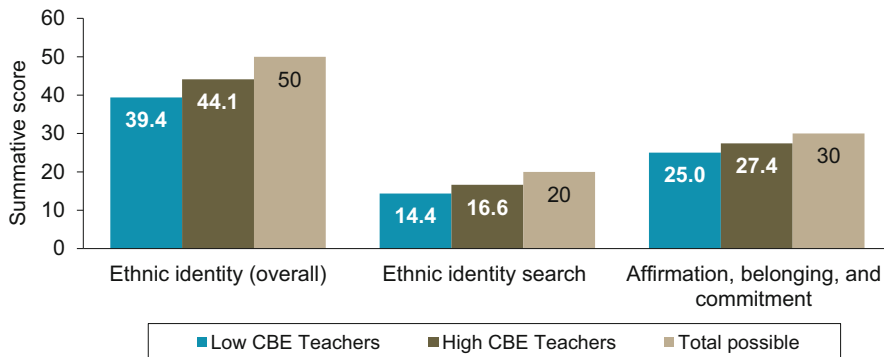

Fig. 3 Cultural affiliation among Native Hawaiian students by intensity of CBE use

their cultural skills outside of school, and are significantly more likely to expect to graduate college (see Fig. 2, Kana'iaupuni et al. 2017).

The same study finds a positive relationship between Indigenous students' cultural affiliation and having one or more high-intensity CBE teachers ($p < 0.001$). Students of high-intensity CBE teachers also have markedly greater knowledge of their culture, commitment to cultural values, and comfort with their heritage language (Fig. 3). High-intensity CBE leads to deeper community connections for students. Over half of students with high-intensity CBE teachers engaged repeatedly in social or political causes of particular concern to the Native Hawaiian community, as shown in Fig. 4. For example, on multiple occasions, one-third of students had attended community or school meetings, and three-quarters had acted to protect the environment in their communities. In addition to these results, students of high-intensity CBE teachers also report greater engagement with local issues such as land

Fig. 4 Native Hawaiian students community action or service (>1 occasion) by intensity of CBE use

development, Hawaiian language revitalization, and Native rights. Together, these differences indicate a consistent positive relationship between CBE and students’ contributions to their communities (Kana’iaupuni et al. 2017).

To bring how it works to life, several examples of CBE follow in this next section, showing the application of five common dimensions of culture-based education (language, content, context, family/community, assessment – see Table 3 in Kana’iaupuni and Kawai’ae’a 2008). First, despite its earlier history and owing to the tenacity of Native Hawaiian communities and many supporters, the state of Hawai’i is a national role model today in reestablishing the indigenous Hawaiian **language** as an official language alongside English in 1978. The state constitution also mandates public education to promote the study of Hawaiian language, culture, and history. Now enrolling about 2000 students annually, the Hawai’i State Department of Education runs K-12 Hawaiian language immersion schools that connect to preschool and post-high programs conducted in Hawaiian and provides additional language classes to parents and community members. It operates roughly 17 Hawaiian language immersion school programs and instructs all learners on the culture and history of Native Hawaiians unique to the state. Additionally, about one-third of the state’s public charter schools also use Hawaiian language as the medium of instruction, and roughly 50% of them routinely use the heritage language, supplemented by language classes. This progress is a tribute to the many Native Hawaiian and supporting community members, teachers, parents, children, and administrators who worked tirelessly to make the vision a reality. Today, although continuously troubled by a critical lack of resources, immersion education has helped grow the Hawaiian language in the past two decades, standing out as a singularly significant educational milestone achieved by and with an indigenous people in the United States.

In terms of pedagogy, place-based learning is a pillar of effective culture-based educational innovation found in many Hawaiian community and school learning

Table 3 Five dimensions of culture-based education (CBE)

Language	Recognizing and using the Native or heritage language.
Family and community	Actively involving family and community in the development of curricula, everyday learning, and leadership.
Content	Making learning meaningful and relevant through culturally embedded content and assessment.
Context	Structuring school, classroom, and other learning interactions in culturally meaningful ways.
Assessment and Accountability	Gathering data and assessing students using various methods to ensure learning and application in culturally purposeful ways.

Source: Adapted from Kana'iaupuni and Kawai'ae'a (2008, p. 75)

environments across the state. Educators use project-based and place-based approaches, interweaving Native culture, community, and the natural environment to inform curricular **content** and instructional **context** for learning (Kaomea 2011; Goodyear Ka'opua et al. 2008). Studies indicate that Native Hawaiian and non-Native children alike learn, connect, and retain knowledge more effectively when the curriculum and instruction are culturally meaningful and relevant to their own lives and experiences (Kaiwi and Kahumoku 2006; Kana'iaupuni et al. 2017; Kawakami 1999). Kahumoku (forthcoming) reports that private school students outperform their peers in advanced placement English and upper-level high school science classes with the introduction of culturally embedded approaches, compared to nonculturally embedded approaches.

Data from Native Hawaiian-focused public charter school (HFPCS) students show high student engagement in learning, which leads to higher attendance and graduation rates compared to Native Hawaiian children in conventional public schools (Kamehameha Schools 2014). Contributing to this advantage are the successes that these schools document in achieving high levels of trust, student sense of belonging, and family commitment in the educational process (Kana'iaupuni et al. 2017). In HFPCS schools, students tackle authentic problems in community spaces and living laboratories without walls. For example, they may conduct science experiments to assess the relative successes of various traditional and more modern methods to restore endangered endemic species or water resources. A 5-year stream restoration project, for instance, partnered *Kanu 'o Ka 'Āina* (Natives of the Land) public charter school students with a team of scientists at the Bishop Museum to entirely restore a Hawaiian stream to natural flow conditions, creating a wealth of lesson plans, data, and presentations documenting their progress (see <http://hbs.bishopmuseum.org/waipio/index.html>).

In schools and programs such as these, curricula include learning about lifestyles, knowledge, and values of Native Hawaiians, including from students' own **families and community** members, who are asked to share their knowledge and their stories with the children in multigenerational settings. As powerful

learning vehicles themselves, “stories can validate identities to the self and the world by providing models of strength and empowerment” (Tusitala Marsh 1999, p. 170). And importantly, learners are **assessed** for mastery in ways that are meaningful to the community. For example, they demonstrate learning through successfully presenting (and implementing, in some cases) their research-based proposal to local residents to restore endemic fish and plants in a river or marsh, contributing to the health of their community ecosystem. In this way, connections to the land, culture, language, and community create a rich educational environment that nourishes spiritual, physical, and educational well-being. These connections generate a sense of *kuleana* (responsibility), love for learning, and students who understand their cultural identity and their role in a local community as the foundation for leading and contributing to broader global communities.

Culture-based approaches also are visible in out-of-school time programs that not only impact students positively but also the broader environmental ecosystem. As one example among many, *Papahana Kuaola* is an organization located on O‘ahu island. It serves roughly 10,000 students each year. The mission of this nonprofit is to “create quality educational programs focused on Hawai‘i’s cultural and natural history, environmental restoration, and economic sustainability fully integrated with Hawaiian knowledge”(see www.papahanakuaola.com). Through a variety of educational programs offered to P-20 learners, learners gain twenty-first-century skills through ancestral practices that build a strong sense of place, critical thinking, collaboration, and communication in modern context, all through a Hawaiian cultural lens. As evidence of their success, the program has forged strong partnerships with local schools and other nonprofit organizations that value Hawaiian knowledge and sustainable lifestyles. The success of their efforts over the past 6 years is evidenced in the dramatic reshaping of the native ecosystem through the removal of invasive plant species, replanting of thousands of native seedlings, lo‘i (taro fields), and stream restoration projects that have improved water quality and riparian health overall.

Navigating for Global Impact: CBE and Mālama Honua

‘A‘ohe pu‘u ki‘eki‘e ke ho‘ā‘o ‘ia e pi‘i
No cliff is so tall that it cannot be scaled

The Mālama Honua Worldwide Voyage embodies the power of cultural advantage on an even greater plane. First, it is a scientific voyaging feat. Second, it illustrates the value of diverse forms of Indigenous knowledge that build compassion for the earth and all of its living and nonliving forms. Third, it radically challenges conventional paradigms and behavior in education. It connects people Hawaiian and non-Hawaiians alike with the spiritual mana

or force that inspires deep relationships and shared understanding. It calls for peace and love, aloha, in a world full of conflict and divides. It is impact with global reach.

Photo By John Bilderback

In casual conversation about education in the United States, one often hears a long list of complaints – outdated instructional models, overly focused on test scores, driven by textbook companies, lacking relevance to real problems and real life, and not engaging our students or attracting our best teachers and leaders. Behind the naysaying, though, is a deep-seated belief that education is a singularly critical process in bettering ourselves as individuals, as a society, as humanity, everywhere around the world. It is sometimes easy to forget that for many people around the world, education is a privilege not equally accessible to all. The United States is no exception. As portrayed in this chapter, Native Hawaiians in Hawai'i, like other indigenous peoples, have fought and continue to work toward greater equity in educational opportunities and outcomes for children today and the future. Equally important and also likely to be forgotten is the need to educate for equity with the natural world living alongside us on this special island called planet earth. Some call it earth or eco-justice. Indigenous culture-based education addresses this call to action. Indeed, indigenous science and perspectives provide a wealth of knowledge, approaches, and tools to use in the effort.

In preparing for each global port, the Worldwide Voyage sought to discover and share stories of hope and inspiration about the innovations and positive impact communities are creating around the world to coexist and to return the planet to greater health. First contact in each place was made with First Peoples of that place to validate and spotlight indigenous sources of ancestral science and wisdom and to point out the gains availed through blended knowledge systems that take full advantage of ancient and modern technologies and science in learning.

So, how do we employ these tools to “crack the code” of how to best care for the earth? This question is a constant for Nainoa Thompson, captain and visionary behind the Worldwide Voyage and the Polynesian Voyaging Society, caretakers of Hōkūle‘a. The answers lie in part in deepening current understandings of local knowledge. Western scientists are realizing that well-being and sustainability rely greatly on local, place-based, and biocultural sources of knowledge and approaches (Sterling et al. 2017).

In the Galapagos, with its history of evolutionary science and protection of some of the earth’s most fragile natural resources, Hōkūle‘a crew members observed that the majority of children grow up understanding a sense of place, in contrast to the seemingly disconnected experiences more familiar to many children in the United States. I noted the following three shared values after visiting several schools and community programs:

- **Deep relationships with nature**, cultivated from interacting outside daily with the native, natural environment, some of it extremely fragile, and observing adults modeling respectful relationships.
- **Mutual interdependence**, based on the connection between human actions and the environment. It’s observable to children in the economy, their parents’ jobs, industry – all rely heavily on understanding reciprocal interdependence.
- **Daily coexistence**, experiential knowledge about how human activity can be managed and regulated to privilege nature as part of everyday life. Galapagueño community members vigilantly guard efforts to achieve greater equity with nature, including limits on the number of tourists or others in any area, respect for wild and plant life, restricted population size, and closely sanctioned activities.

Exploring the Galapagos represented a unique opportunity to celebrate Charles Darwin and his work, which continues to guide modern evolutionary science today. It was also a chance to recognize age-old evolutionary knowledge, long predating Darwin’s work. In Hawaiian epistemology, exemplars like the Kumulipo recount wisdom about the origins of the universe and evolution (Beamer 2014). That the Kumulipo was well-established as a generations-old oral history and even put into print before Darwin published *On the Origin of Species* is a little known fact important to understanding the power of ancestral scientific connections.

Passed orally through many successive generations, the Kumulipo was eventually translated into English by the last reigning sovereign of Hawai‘i, Queen Lili‘uokalani, while she was imprisoned during a coup staged by American businessmen and missionaries. The Kumulipo is creation chant, genealogy, and evolutionary science recognizing that all life shares common ancestry. Life begins with darkness, pō, the spirit world. It emerges in the depths of the sea with invertebrate organisms such as coral, before proceeding to develop greater complexity across ocean, land, and sky, with life evolving from like, eventually human in form (Lili‘uokalani 1897; Beckwith 1951).

A genealogical chant of “remembrance from the lipo of our deep past to the lipo of our unknown future,” the Kumulipo conveys the carefully cultivated Hawaiian scientific mindset and keen observation skills developed through the lens of interdependence and kinship between people and the earth, land, and sea (see Forward by Kanahale in Beckwith (1951), 2016 reprint). Native Hawaiian zoologist, Ane (2016), argues, “the chant teaches us that life in the sea and life on land are inexorably connected, and what we do on land has a direct connection and impact on all organisms in the sea. Hawaiians recognize that these organisms are the building blocks for all life on this shared planet we call Honua.” This approach stands in stark contrast to more individualistic, technical teaching conventions of Western science. Should today’s global learners experience this knowledge in addition to Western approaches?

From the perspective of cultural advantage, the answer is yes. In fact, all life forms today would benefit from embracing diverse knowledge systems to care for the earth. As conservation biologist, Samuel Gon observed, a noteworthy distinction from Darwin’s framing is that the Polynesian worldview holds nonhuman life, including plants and animals, as ancestral, therefore familial, and sacred. The Western view of man separate from the rest of nature, perhaps even as having dominion over it, has allowed massive abuse and exploitation of natural resources that would be morally indefensible in a Polynesian view. This lesson of the familial connection of people to the living elements of each place, and the responsibilities placed on people as caretakers of those ancestors is the lesson that can ultimately save the world from our current path of destruction.

Continuing the Voyage (Conclusion and Future Direction): A Call to Action for Learning and Self-Determination

E mau ke ea o ka ‘āina i ka pon,
THE life of the land is perpetuated in righteousness

This chapter is a call to action to transform educational systems as sites of power negotiation and liberation of individuals, communities, and nations. It is a call to recognize the gift of knowledge tied to cultural tradition and language with accountability to student outcomes that are useful and meaningful to local and Indigenous communities. It is but one milestone in a journey that many others will continue to build and refine.

The intensifying movement toward Indigenous culture-based education (CBE) in Hawai‘i owes much countless individuals who have devoted lifetimes to reimagining educational systems where all children blossom. Like life-giving elements of rain, soil, and sunlight, educators can move forward to create more just and equitable learning environments built on cultural assets to foster improved outcomes for Indigenous learners and communities in ways that benefit all.

Adopting the theoretical lens of cultural advantage raises critical questions about who benefits from particular pedagogical approaches. For instance, how do students,

Indigenous or otherwise, experience “culturally appropriate” school events? How might these experiences reinforce or challenge students’ belonging, self-efficacy, and community connections? These questions can position students with greater power and agency in relation to the context and purpose of their learning. When taught to examine daily life events consciously and critically, drawing from the cultural values and experiences of their communities, students are empowered to self-determine their participation and utilization of events/tools, even those originally conceived to mask inequity.

Overall, research provides a strong case that CBE is well-suited for further development and implementation, based on its efficacy for children, its alignment with other research-based best practices, and its appeal among a growing number of teachers pursuing greater relevance for learners. CBE builds foundations for positive relationships capable of igniting powerful learning for students and communities, heightening students’ socioemotional development, self-efficacy, and community engagement. These connections are especially valuable in Indigenous contexts where families have experienced multiple generations of marginalization within public schools. The research findings have broader policy and program implications for national efforts that often fail to recognize the importance of language and culture for Indigenous and other minoritized children and families. The consequences of this failure are replete in the well-worn trail of low achievement, low socioeconomic status, and poor health of this nation’s Indigenous and minoritized populations.

Countering these challenges, there is a shift happening in Indigenous education and research not to focus on the devastating after-effects of colonization but to recognize and value the strengths and resilience of Indigenous communities. Mālama Honua Worldwide Voyage is only one example added to the work of many educators, and researchers across the nation demonstrating what is possible when communities are able to guide the education of their children, unleashing greater relevance, and meaning in both outcome and substance.

Today, Hawai‘i’s children learn about Darwin’s evolutionary science in school, how can learning Hawai‘i’s own place-based ancestral science create even strong pathways for learners to care for the earth, to Mālama Honua? In addition, why should they and others not be exposed to the diverse insights captured through indigenous perspective like the Kumulipo as they learn science and other subjects? More broadly, how might we as educators build pathways for Native children to learn about their own knowledge systems in addition to learning about evolution from a Western view?

Clearly, fresh research and development is needed to cultivate culturally rich, deeper learning experiences for students where experiencing their kinship with the earth is an everyday occurrence. For this to happen, educators need better tools to engage students more effectively in learning the language of nature and families supported to come together as communities that care for the earth and each other. The earth is in crisis. To match and counteract the exponential pace of destruction, the pace of positive change must also be exponential. Further work is needed to discover and develop proof points, models of success, to share and disseminate and scale and institutionalize transformational innovations through systems change.

Embracing the potential of Indigenous knowledge and culture-based education is a “win” for everyone in our increasingly plurilingual, pluricultural world. All of society will benefit from the assets found in cultural knowledge, values, and stories as models of vitality and empowerment through which we can all progress.

Abstract

For those who enter a new country as labor migrants, the appropriate support to adapt to the work place and the country is essential. An appreciation of cultures against the background of a strongly capitalistic model where human labor can be treated as a commodity must be negotiated. Some employers provide just minimal care while others adopt a “family” model. Through a case study between a Māori employer and Tongan RSE workers, a successful pastoral care model based on ako (to learn and to teach) and kāinga (kin, village, place) has been a strong contributing factor to a successful business relationship. Implicit in the relationship is a shared value base which derives from both groups sharing common, albeit ancient ancestry genealogy/whakapapa. Key outcomes include a sense of obligation, accountability, and reciprocity and a sense of belonging through the

deliberate and authentic application of Māori values and world views. The Tongan workers added their cultural capital to the interaction legitimizing an ongoing obligation to kinship across space, time and generations.

Recognised Seasonal employment and pastoral care · Ako and kāinga · culture and seasonal employment · pastoral care model

Introduction

The Recognised Seasonal Employment (RSE) scheme is a seasonal labor strategy introduced to New Zealand in 2007. It allows for the temporary entry of migrant workers in the horticultural and viticultural industries, with a preference for workers from the Pacific nations.

There is only one Māori RSE employer, Kono, whose workers are sourced from Tonga. Kono is a subsidiary company of Wakatū Inc. which is an internationally recognized Māori business of the land and sea with an asset base valued at over \$260 million (Wakatū [n.d.](#), para. 4). Kono is based in the rural community of Motueka, near Nelson at the top of the South Island. It is the food and beverage arm of Wakatū Inc.

A central part of the RSE scheme is to ensure that there is a pastoral care system in place which also includes the upskilling of Pacific workers. The upskilling and learning is expected to contribute to Pacific development and New Zealand's objectives for economic success and stability in the region in addition to the social benefits that will emerge. Workers will return to their home countries with new experiences and capabilities which may lead to the creation of new business enterprises (Bailey 2014).

This chapter outlines a case study of the business relationship between Wakatū/Kono, a Māori business and Tongan RSE workers. It examines the pastoral care system and the adult learning process which is integral to upholding the pastoral care. The pastoral care extends from Tonga to Motueka, New Zealand, and is based on two Polynesian concepts namely ako (to learn and to teach) and also kāinga (village, people, land, place). The concepts of ako and kāinga have been vital ingredients to a successful pastoral care program which has supported the RSE team to be a cohesive and productive unit while upholding their cultural integrity. With both Māori and Tonga being from Polynesia Pacific, there is also a uniquely common knowledge base which derives from both groups sharing common, albeit ancient ancestry genealogy/whakapapa.

Enriching this chapter are the voices of the RSE workers with whom a number of talanoa were held. Talanoa is a self-reflection, conversation, or exchanges between two or several people. It is a culturally constructed pedagogy and discussion which has been developed into a methodological tool for interview and research (Vaioleti 2006, 2011). This chapter forms part of a larger PhD study which reflects on the

development of a pastoral care model which is founded on the concept of “kainga,” a relationship enhancement model in which culture is practiced and validated and accountability and support structures are important. The cultural term of kainga is adopted as the key reference, and it is an appropriate concept of reference when a Māori business is in a relationship with a Tongan business entity. Kainga is a proto Polynesian word meaning people who are kin-related. It can also mean place and village. My hypothesis in the PhD study is that both culture and the importance of relationships built through the pastoral care arrangements and through the concept of kainga contribute significantly to the success of this RSE partnership.

The Recognised Seasonal Employment (RSE) Scheme

This RSE program aligns with the New Zealand’s government’s strategy in strengthening Pacific partnerships with a focus on economic development, regional integration, and good governance (Nunns et al. 2013). It takes into account the long-term relationships that New Zealand has enjoyed in the Pacific. David Cunliffe who was the then Minister of New Zealand Immigration stated in a media release to promote RSE that “We are prioritising Pacific people as temporary migrants for these industries because of our special relationship and commitment to the Pacific region. This policy will lead to the upskilling of Pacific workers, who will return to their home countries with new experiences and capabilities” (New Zealand Visa Bureau 2006, para. 9). Australia has a similar scheme called Seasonal Work Program (SWP) which was announced in 2011 following 3 years of trialling a Pacific Seasonal Worker Pilot Scheme (PSWPS).

The preference for workers from the Pacific nations focuses particularly on those from the rural areas with a selection criteria that prioritize the pro-poor. This is because there is an excess workforce in the Pacific and opportunities for work are very limited. In the rural areas, there are even more constraints for work and a large pool of unskilled and low-skilled workers exists (Roorda 2011). The RSE scheme represents a means for Pacific workers to – temporarily – access the New Zealand labor market, currently restricted to horticultural and viticulture industries only. The number of RSE visas now available to temporary workers has steadily increased since the program began. Immigration New Zealand reports there are now 10,500 RSE visas available annually for qualifying workers, a substantial increase from 5,000 at the introduction of the RSE program in 2007 (New Zealand Government 2016, para. 2). Although a number of Pacific nations participate in the scheme, numbers are weighted towards ni-Vanuatu and Tongan workers.

Bedford (2013) reported that eight Pacific countries participate across New Zealand and Australia’s temporary employment schemes. In 2013, 7,456 workers were employed in New Zealand under the RSE visa category. Significant representation of key groups of Pacific populations are involved in this temporary work scheme, with 1,573 Pacific RSE workers being sourced from Tonga (Bedford 2013). For Pacific nations with relatively small populations and even smaller working populations, these numbers can represent a significant proportion of

demographic groups. For example, of the approximate 10,000 rural males in Tonga between the ages of 20–44, 28% will take part in managed migration. The overall gender imbalance is also significant, with 89% of Tongan RSE workers being male. Bedford (2013) stated this imbalance is the result of both employer and sending country preferences. Sending country preferences for the dominant representation of males in worker groups include ongoing socio-cultural beliefs that “outside work,” i.e., horticultural work, continues to be the domain of males.

In New Zealand, recruitment for the RSE is “industry-led” and is dominated by employers not labor hire companies (Bedford and Bedford 2014). The process for recruitment can be broken down into four stages. The first stage is for employers to become recognized as a Recognised Seasonal Employer (RSE), with Immigration New Zealand. Factors taken into consideration on assessment of employers requesting RSE status includes being able to demonstrate human resource policies and practices of a high standard, as well as providing evidence of promoting the welfare of workers.

The second stage is for an Agreement to Recruit to be awarded allowing for the sourcing of prospective workers from overseas. In the third stage, the employer makes a job offer to the workers, proof of which the worker will need in order to make a visa application from offshore. Fourthly, and as is becoming commonplace, employers can invite workers to return in subsequent seasons so long as the conditions of the visa have been met in previous seasons. As noted from the recent RSE employer survey, it is of high interest for employers to seek the return of workers in subsequent years to leverage workers cumulative skills and lessen annual integration costs and risks. There is no limit to the number of times workers can return under the RSE scheme, provided all visa conditions were met in previous seasons.

Part of the agreement of New Zealand RSE employers includes covering half of the worker’s return airfare, the provision of at least 240 h of work at market pay rates for the season and accommodation, or at least access to accommodation paid for by the worker, and pastoral care. An RSE employer is also liable to pay the costs associated with worker removal from New Zealand if a worker breaches their visa conditions (New Zealand Immigration 2014).

The RSE delivers triple wins. The recipients are the workers, the sending countries, and the destination countries. It is regarded as a model of best practice by the United Nations for low-skilled managed circular migration (Bedford 2013). Employers benefit from the scheme with efficiencies by having access to a temporary workforce who are highly motivated and reliable. Workers’ families benefit with positive impacts for the household which raises the standards of living. Bedford and Bedford (2014) report that workers’ remittances have enabled investment in new housing, children’s education, the purchasing of land and equipment, improving sanitary and waste disposal, supporting relatives and the church, and a range of community development initiatives.

With significant numbers of working Tongans generating income internationally, males, particularly those from rural villages in Tonga, are remitting tens of millions of dollars per year with detected remittances measured at 28% of annual GDP in

2009 (World Bank Group 2016). RSE is now the largest source of temporary work for wages outside of Tonga with 85% of RSE and Australia's Seasonal Worker Program (SWP) workers coming from the Pacific.

Tongans are eager for employment opportunity, illustrated by the fact that over 5,000 Tongans registered for the work-ready pool within the first 3 months of applications opening for the first intake of the RSE program in New Zealand (Gibson and McKenzie 2011). For a small island nation like Tonga, international labor inclusion like RSE can also provide a catalyst for the establishment of entrepreneurial cluster businesses and shows promise for addressing unemployment, underemployment, and even work experience challenges for Tongans. Measuring unemployment in Tonga is problematic as there is a lack of precise and recent data and many subsistence workers would not generally see themselves nor register themselves as unemployed. Opportunities for employment in Tonga remain an ongoing challenge especially for youth in Tonga. The challenge is surely greater as a lethargic private sector and outwardly focused government offer little hope for realizing the potential of a youthful population reputed to be the most highly educated of the Pacific small island states (World Bank Group 2016). The World Economic Forum (WEF) Global Risks 2014 report has highlighted unemployment and underemployment as the second highest overall *Global Risk of Highest Concern* in 2014. The report speaks particularly to the challenge of youth unemployment stating that in the developing world, an estimated two-thirds of youth are not fulfilling their potential. Many of the workers who are selected under the RSE have not advanced beyond the senior secondary school level, have limited English, and find themselves caught in a poverty of opportunity.

Pastoral Care Within the RSE Scheme

The recruitment for RSE is industry-led and the provision of pastoral care is also employer-led. Although policy dictates an obligation for the provision of pastoral care, RSE employers have broad interpretive scope as to the depth and breadth of pastoral care provision. The pastoral care requirements under a RSE scheme are quite minimal. An employer has to demonstrate human resource policies and practices of a high standard, as well as providing evidence of promoting the welfare of workers. Legally, this means that as far as the minimum standards dictate that an employer must provide documentation regarding:

- Pick up and drop off of workers from the airport
- A work induction program to help workers settle in
- Arrange somewhere for workers to live at a fair price
- Provide transport for workers to get to and from work
- Explain how and where workers can get medical insurance
- Explain how and where workers can access banking services
- Explain how workers can send money home safely
- Provide any safety equipment they need to do their job, e.g., protective clothing

- Provide toilets, somewhere to wash hands, first aid, shelter, and fresh drinking water
- Provide translations of health and safety instructions for workers
- Give workers opportunities for recreation and religious observance (Immigration New Zealand 2010)

There are various ways that employers meet these pastoral care obligations. Some employers contract the work out, some do it themselves by appointing a designated staff member, and some employers rely on the leadership within the workers as a self-monitoring tool. The monitoring of the pastoral care obligations is difficult with resourcing, time, shortage of inspectors, and geographical logistics being obstacles (Bailey 2015/55). Bailey has also noted that pastoral care in RSE would benefit greatly from improvements in cross-cultural communication. According to studies by Charlotte Bedford (2013), pastoral care issues improved over successive seasons. She attributes this to increased understanding and cooperation between workers and employers over time.

For a pastoral care model based on a cultural perspective, the Wakatū/Kono relationship with its seasonal workers is unique because Kono is the only Māori employer who is accredited with RSE status. While other RSE schemes may choose workers from the same village/district to draw on the social cohesion factor, the pastoral care models operates differently because the employer is not a Māori organization. This is not to say that the attention to pastoral care is less; Kono is based on Māori values in practice and philosophy at all levels.

In this case study between Wakatū/Kono and the RSE workers, the recruitment, selection, and the pastoral care element which includes education is conducted through a small NGO called IMPAECT*, Indigenous Māori and Pacific Adult Education Charitable Trust*. IMPAECT* has been a registered trust for more than 10 years. As one of its objectives, it proposes to advance educational aspirations for both Māori and Pacific communities using the principles of adult education to achieve outcomes that are valid, authentic, and meaningful for Māori and Pacific and to support family and community development for Māori, Pacific and indigenous groups (IMPAECT* Constitution 2003). It operates in Tonga and in New Zealand. IMPAECT* brings in 38 workers in all, predominantly male (24 for a 7-month period from November to May and another 14 workers from February to July). The author of this chapter is a member of IMPAECT* and also has whakapapa/genealogy to the people of Wakatū/Kono. Through family relationships including with families in Tonga, IMPAECT* was established and the RSE partnership formed.

The Importance of Values in Pastoral Care

Wakatū/Kono is a Māori business which upholds Māori cultural values with a focus on manaakitanga (care and respect for people and relationships), kaitiakitanga (stewardship), and whanaungatanga (extended family obligations).

Wakatū/Kono have created a positive and inclusive work culture which has affirmed culture, encouraged participation, and embraced stakeholders including the IMPAECT* workers as part of the extended whānau/family. This has allowed the workers to feel valued as people not just as a labor commodity. Wakatū Inc. has developed a range of commercial and cultural expertise in terms of how it manages traditional Māori land and resources for the intergenerational benefit of its owners. The knowledge of its owners and governors is extensive, and it bridges traditional western business approaches with tikanga Māori. Ropata Taylor, General Manager of Manaakitanga for Wakatū Inc., says that Māori business is “not about commercialising our culture, it’s about culturalising our commerce” (Talanoa, Ropata Taylor, July 2014). Wakatū have continued to maintain this dictum.

Spiller et al. (2010) state:

Many Māori values place particular emphasis on respect and care to engender belonging. These values include: manaaki, meaning to show respect or kindness; aroha, which is to show care, empathy, charity, and respect; hau which means to respect, promote, and maintain vitality; kaitiakitanga, which includes stewardship, guardianship, and wise use of resources; and hāpai meaning to uplift others. Care is at the heart of the Māori values system. (p. 4)

The Tongan workers individually and collectively under IMPAECT* are not passive recipients in a work scheme but are active participants who are astute to business opportunities and who have expectations of respectful and meaningful relationships with their employer. They too have deeply embedded value systems based on anga faka tonga/Tongan philosophy (Vaiotei 2011) which incorporate values similar to other Pacific communities including Māori. These are the holistic nature of life and the centrality of good relationships: the connectivity of the past, present, and future; of people, land, sea, and sky and the spirituality that binds them together (Taufe’ulungaki 2003).

More specific Tongan values include:

- ‘ofa, love and its subgroups “mafana/warmth” which drives ‘ofa to action
- faka’apa’apa, respect
- feveitokai’aki, reciprocity
- lototō, humility
- feongoongoi, transparency and accountability
- fatongia, one’s role, duty, or obligation to family and community

Tauhi vā (the nurturing of respectful space) must be present to maintain a symbolic space between individuals, groups, and with the Gods. This is vital for harmony and good relationships and to corresponding social, economic, environmental, and educational systems which encompass spiritual dimensions (Ka’ili 2005; Vaiotei 2011).

These values locate themselves in a broader worldview where Pacific peoples (among other indigenous peoples) have over generations built up layers and layers of

complex history and knowledge which connects them with their environment, their spiritual world, their ancestors and has allowed them to live sustainably and wisely for the well-being of their collectives. It is therefore important that both Wakatū/Kono and the workers synergize for holistic, sustainable economic partnership through embedding relational considerations across all employer/worker partnerships. The pastoral care does not act in isolation rather it is embedded within the values of both the Māori business of Wakatū/Kono and the culture of the Tongan workers. These values support the creation of multidimensional outcomes for economic, social, cultural, and developmental outcomes and benefits for all.

The pastoral care model for the IMPAECT* workers is founded on the concepts of whānau/family and kāinga/village. This is a relationship enhancement model in which culture is practiced and validated and accountability and support structures are important (Morrison 2014). In fact, the pastoral care model of kāinga in New Zealand replicates and is embedded in the contextual and complex social norms from Tonga which incorporate the learning concepts of ako (learn and teach), ilo (knowledge), and poto (wisdom). Further explanation of kāinga will follow.

Ako is a Polynesian concept and means both to teach and to learn in a symbiotic relationship. Ako is to learn behaviors, life skills, or knowledge in a society where people are expected to behave in accordance with their various roles and status. This is important to maintain social cohesion and also intergenerational transfer of knowledge. It involves many pedagogies such as training, learning by osmosis and observation, reflecting, and practicing (Thaman 1988; Vaioleti 2011). These present as informal and nonformal learning opportunities which are often tested against natural and human phenomena (Thaman 1988). The purpose of ako was decided by the needs of the group and there was always almost shared understanding and vision (Thaman 1988; Vaioleti 2011).

Tongans make a clear distinction between knowledge (‘ilo) which is acquired through learning (ako) and wisdom (poto), which is the “beneficial use of ‘ilo or knowledge” (Thaman 1988). Clearly, knowledge is not expected to be achieved for its own sake unless it is worthwhile and benefits others. Knowledge is said to make people poto and to help them fulfill their fatongia (service, role, obligation) to their respective groups – whether these be family, community, school, church, or country (Vaioleti 2006, 2011).

Ako is therefore about action to transform the situation and improve well-being. Its transformative agency is important in bringing increased well-being to families, community, and kāinga. Certainly, as mentioned earlier, this is one of the objectives of RSE to improve livelihoods for Pacific peoples in their home nations through remittances and the building of their social and economic base.

Kāinga is the extended family which need not be geographically bound. It is a concept familiar to many Polynesians. Tongan academics (Kalavite 2012; Mahina 1993) record kāinga as the basic social unit of Tongan society and that it refers to blood or kin ties or living in an extended close-knit family and can extend to ancestral domains. Kāinga is also where learning occurs to solidify a community base, a spiritual base, and to build an economic base. The development of kāinga

required visionary and successive leadership, smart economic sense, physical effort, and sharing of skills, and through these efforts, kāinga gathered regularly in the same place to enjoy the benefits of their labor (Talanoa, Vaoleti, July 2014).

Kalavite (2012) and Tu'itahi (2005) individually produced a set of values as core underpinning principles for kāinga. Kalavite's reference to kāinga was based on the academic success by Tongan students in tertiary education while Tu'itahi interrogated how a kāinga became economically and socially successful in New Zealand. The values articulated by both authors within a kāinga include mo'ui fakatokolahi (living together in a cooperative lifestyle), fetokoni'aki (helping each other), tauhi vā (maintenance of good relationships), and faifatongia (cultural obligations). Helping sustain relationships within the kāinga was attributed to maintaining the vā.

Thaman (1988) says that Pacific people have a "consocial" sense of personhood which emphasizes their community or kāinga/kinship connections, the environment, behavior, and contextual flexibility. The "human" aspect to labor is broadly evident in RSE, a humanness and collectivism perhaps not so evident in other industries which relies more heavily on individualism. This reflects the operational ambitions of Māori-centered business such as Wakatū/Kono Inc. by acting "intimately, flexibly, and with critical consideration to local conditions, particular contexts, and the needs and concerns of others" (Spiller et al. 2010, p. 6). As a Māori business and RSE employer, Wakatū/Kono have broad capacity to work flexibly and seek creative opportunities to deepen efforts to serve all its whānau and stakeholders, including but not limited to Pacific RSE workers.

For the workers, the value generated through effective, stable, and trusting relationships brings benefits beyond what can be measured in "profit" terms alone" (Spiller et al. 2010). Cases of high-performing Pacific RSE workers turning down offers to work for other employers have been reported (Bailey 2015) indicating a functional level of trust and loyalty between RSE workers and employers, as well as the value RSE workers place on the stability, and a sense of closeness to one particular employer.

The IMPAECT * team has been intentional and deliberate in adhering to a leadership and management style which is traditional in nature, based on kinship, reciprocity and underpinned by collectivistic notions. In some ways, this has deviated from the protocols demanded by the policy guidelines of the RSE scheme; however, this chapter posits that it is these traditions and operations which have actually been responsible for the ongoing success of this particular partnership and work model.

Consequently, worker selection is well considered and the IMPAECT* selection team prioritize that workers:

- Have a kinship connection to a member of IMPAECT*
- Have a commitment to ongoing education and learning at all levels
- Have a commitment to supporting the well-being of their family, village, and nation Māori and Pacific peoples generally
- Be actively engaged culturally in their communities and understanding cultural tenets

The Pou Awhina (Pastoral Care Leader)

In the IMPAECT* team, the pastoral care is led by the Pou Awhina. This name comes from the local marae in Motueka called Te Awhina Marae, which is where the workers are welcomed upon arrival. Pou means the pillar of strength. The relationship between all the workers and in particular with the Pou Awhina is based on the concept of *vā*, described previously as the space that relates, a description that references the social roots of a concept for a group of principally relational beings. It is the space in between, it is a space that connects (Ka’ili 2005; Lilomaiva-Doktor 2009; Mahina 1993).

In this RSE scheme, the maintenance and nurturing of the *vā* guides all within the scheme; however, the Pou Awhina becomes the principal guardian of this important concept which is a major contributor to the group’s pastoral care. The Pou Awhina is also a senior Tongan woman capitalizing on the matriarchal leadership model which according to Taunaholo (Talanoa, Maleponi Taunaholo, May 2014) draws its potent power from two pillars of Tongan thought, *nofo* ‘a *kāinga* (codes of living as *kāinga*) and *laumālie* / ‘*Otua* (higher spirit) which are discussed later. This is a carryover of the social and cultural hierarchy from Tonga to Aotearoa. This symbolic leadership of Pou Awhina is important as it represents an important cornerstone role in a Tongan relationship, be it employment or social.

The Pou Awhina takes overall responsibility for worker well-being including spiritual care; however, a strong ethic of support and accountability exists within the workers themselves, towards the Pou Awhina and intrinsic support and accountability also to Wakatū/Kono Inc. as well as to IMPAECT* leaders. It is in this interloyalty or reciprocity that it is possible to maintain the *vā* in these relational roles and the attainment of harmony. Tongans will say that ‘*oku tau nofo moe* ‘*Otua* (that God or the spirit is with us) and that the state of *nofo* ‘a *kāinga* is achieved (Talanoa, Maleponi Taunaholo, May 2014).

Equally important is that *ako* (learning and teaching) has the ultimate aim of contributing to harmony with the spirit and good *nofo* ‘a *kāinga*. There are four distinct phases in the *ako* journey for the workers which are led primarily by the Pou Awhina with other IMPAECT* members:

- *Ako* ‘i Tonga – Worker selection and readiness for New Zealand
- *Ako moana ki te whenua* – Worker transition
- *Ako whenua ki te kāinga* – Worker enhancement through daily routines and community interactions
- *Ako* – ki he *vā kāinga* – Worker return to family/community in Tonga

Ako ‘i Tonga: Worker Selection and Readiness for New Zealand

Ako ‘i Tonga focuses primarily on two relationships. Firstly with the selected worker and their family and secondly with the government officials which require legal compliance matters to be completed.

New Zealand legislation requests candidates pass police checks and health checks and will abide by the rules of the receiving country (New Zealand Immigration 2014).

Orientation programs assist the workers to be informed on legal requirements of entry into New Zealand and ease their transition into a new country. For someone who has come from a poor community, generally their access to formal education has been limited. Their cultural competency skills, however, should not be underestimated. With the support of the Pou Awhina, the informal learning processes allows for the translation of the concepts and information and for the forms to be correctly completed.

Once workers indicate their wish to be selected, then the IMPAECT* selection team sit down with the wider family to Talanoa. The whānau/family is just as important as the worker. The family must place their wholehearted support behind the absence of their loved one. They have to be able to sustain themselves, be emotionally strong to keep the family relationships intact, and be aware of the challenges which can be expected. Financial goals are then set with the agreement of the family, so every family member knows methods of remittances, savings which are possible and can begin planning.

There are discussions regarding the welfare of the family during the absence of the family member and the resources that will be available to meet the family's needs. Is there sufficient food in the plantations and gardens? Are other family supports close by? What will happen should a family member fall sick? These are examples of testing the resilience of the family as in the course of a 7-month absence, many significant events and family milestones may occur. For many families, this may be the first time that the worker may have had a steady regular job and been in the position to set a financial goal. Basic financial calculations are worked through even at this early stage of the recruitment process so that each worker and their family together can set short- and long-term goals which then further entrenches the workers' commitment to the scheme to promote a successful period of work.

As a follow on, the worker's ability in the English language is also assessed, and while it is desirable that they have a good knowledge of English, it is not mandatory as others in the team will be able to convey messages and English language programs can be available. IMPAECT* conducts its own orientation program teaching about New Zealand culture, the context of working in the small rural town of Motueka, working and living conditions, team cohesiveness, and ability to listen to instruction and to abide by the guidance of the Pou Awhina. Visual pictures are often shown to help give meaning and some equipment has been sent to Tonga by Wakatū/Kono so that workers can test their physical strength, as well as cognition and team skills. Many of the selected workers come with a high degree of apprehension as recorded: "I felt very nervous going to New Zealand to pick fruit for the first time cos I know I will miss my family" (Talanoa, Participant B 2015). "I want to go and earn money for my family and I hope I can work well" (Talanoa, Participant C 2015).

Ako 'i Tonga acknowledges that every worker belongs to a family and a community or kāinga. Relationships therefore must be preserved through good communication from the kāinga in Tonga to the kāinga which will be recreated in Motueka

for the workers. It is important for the IMPAECT* team to extend pastoral care or nofo 'a kāinga to the families in Tonga so that the members working in New Zealand have strong families in Tonga to which to return. It makes no sense to achieve the aim of robust nofo 'a kāinga in New Zealand but the nofo 'a kāinga in Tonga is weak. If the purpose of kāinga is, as Vaoleti (2011) says, to be decided by the needs of the group with shared understanding and vision then Ako 'i Tonga is where the source of the vā must emanate from, for the well-being of the workers.

Ako moana ki te whenua: Worker Transitions

Ako moana ki te whenua allows for the transition or migration of the workers from Tonga to New Zealand and, in particular, to come under the manaakitanga of the people of the land.

The workers are made aware of the history, the structure, and the values of the local tribe which contributes to the philosophy of Wakatū/Kono to enhance their awareness of the environment and sense of belonging. All this is conducted through Talanoa and hands-on practical learning and prepares the workers to be ready to live and work in a place and on the land of the indigenous people which has its own spirituality and meaning. The social structures for both Māori and Tongans are similar being both descendants of Polynesian ancestry; yet the colonization of Māori has ruptured an ancient shared past and while there are shared cultural synergies, there are also differences too.

Critical to being employed under the auspices of Wakatū/Kono is the importance of rituals being conducted. Firstly, the workers are greeted with a powhiri or a ritual of an encounter which allows for the people of the land to connect spiritually to include the workers into their fold.

During the exchanges which sets the parameters of the relationship, there is much speech making, and the RSE workers are thanked and honored for leaving their families and coming to New Zealand to pick fruit and to work. Traditional narratives are then shared on the history and colonization of the land and how the local tribe are now engaged in development initiatives to grow the tribe economically, socially, and culturally. Sometimes, there may be exchanges of song and dance during the shared feasting which concludes the ceremony.

The workers are accepted as part of the extended family of the tribe (whanaungatanga), to engage in a reciprocal relationship of respect (manaakitanga), to value what the land produces as gifts (kaitiakitanga), to share in the many activities of the marae, and to uphold the reputation of the tribe (rangatiratanga). The terms of the relationship are set by creating understanding, providing information, and inviting an engagement based on honesty and accountability to each other (pono). The powhiri is held every year despite many workers being repeat workers.

This experience through this ritual can be overwhelming; however, many workers become aware of its spiritual meaning and feel privileged to have been given such a welcome as can be seen in these talanoa with the workers: "the powhiri is a very powerful experience" (Talanoa, Participant A 2015); "the marae and the powhiri is

important and helps us as Tongans feel welcome. It is a good learning to know about the Māori culture and to feel it in our heart” (Talanoa, Participant B 2015).

It is important to note that while it is the Governance Board who has articulated Wakatū/Kono’s stance on Tikanga Māori, it is the Management and Supervisor’s team with whom the RSE team have the most contact. Their operations must uphold the mana/prestige of Wakatū/Kono and they have a mandate to adopt management styles consistent with those principles.

Wakatū/Kono and a team of RSE workers from Tonga have both consciously and unconsciously engaged in an interaction which draws on their cultural capital, reaffirms a shared ancestry, a shared value system, and ancient connections which have been refreshed through this RSE scheme. Māori and indeed Wakatū/Kono Inc. reference the system of kāinga, of relationships, of duty, of service, of the need for group cohesion, of sacred narratives, of land and of spiritual connectedness, and of the integral role that ako, ilo, and potopoto play. This sets the stage well for both parties to benefit economically from their partnership.

Ako whenua ki te kāinga: Workers Routines

Ako whenua ki te kāinga allows for the workers to settle into routines in the workplace and their recreated kāinga. This is a vital stage and the point of intersection of different kāinga from Tonga to merge to create a common kāinga in New Zealand for the duration of the RSE term. The worker composition may have heads of families or be from different distinctive groups of the Tongan hierarchical structures and must adjust to routines expected by IMPAECT* and the business character of Wakatū/Kono. The values that will enhance a nofo 'a kāinga vital for the success of the recreated kāinga include mo'ui are fakatokolahi (living together in a cooperative lifestyle), fetokoni'aki (helping each other), tauhi vā (maintenance of good relationships), and faifatongia (cultural obligations).

Ako also allows for osmosis, for learning an observation, and for problem-based learning. The work tasks for horticultural workers are:

- Harvesting of fruit
- Pack and sort fruit
- Prune fruit trees
- Maintain crops
- Summer pruning and thinning
- Tree training
- Tractor driving
- Quality assurance of fruit

Within all of these tasks is a level of expertise and skill required. This is in addition to a high level of fitness and care that workers must possess. Returning workers become the mentors to newer workers using the concept of ako and everyone knowing their role so that the collective can benefit.

Sometimes, the workers' willingness to please their employer can mean that they say they understand an instruction when the truth is the opposite. Being a cohesive group with kinship ties and cultural understandings based on *ako* and cooperation and support of each other helps to complete tasks. No one worker is left to fail.

Through briefings, practice, and on the job experience and practice in the orchards, and the daily discussions and reflections on how the day went, successful engagement is built. This is a significant part of *ako* and here lies the opportunity for the team leaders and more experienced members of the *whānau* to offer the skills and advice to those that need support.

Similarly routines are set up in their accommodation which now operates like a little village (*kāinga*). An emphasis on cooperation and collaboration is again paramount but then fundamental to Tongan society is the obligation to their collective kin (*kāinga*) and so in many ways this *fatongia* (obligation) is intrinsic to the workers' character anyway. Consequently, the *vā* continues to be nurtured.

Every evening following the work day, the Pou Awhina calls the workers together to share in the evening meal together and to be followed by reflection, prayers, and singing, a time known as *famili* (family). The reflection is a guided sharing which encourages the workers to reflect on their day, their insights, new learnings, and challenges. Through ongoing sharing then the group is able to strengthen, share concerns, and find resolutions to potential problems. It also helps workers find and learn new coping strategies should the need arise. This is 'Otua and *nofo* 'a *kāinga* pillars at work. The pillar of 'Otua occurs in the everyday family/family or *kāinga* time.

The sending of money is an important activity in helping maintain the *vā* and the relationship with families in Tonga. Culturally, it is not just about transfer of capital but can be viewed as an exchange of tributes where the family in turn reciprocate by sending back prayers, blessings, and goodwill to their family member. This act supports the well-being (physical and spiritual) of the *kāinga* and gives all members a sense of empowerment. Financial remittances are sent back weekly to families in Tonga, building their critical literacy skills as well as financial literacy skills.

The time for harvest is very important. There is an early morning gathering in the orchards where prayers of thanksgiving are made before the carved figure of the Māori God of Harvest, Rongo for the abundance of fruit grown and produced from the land. The workers are invited to be active participants by leading prayers in partnership with the Māori owners. They say "it was a very deep experience being able to conduct prayers of thanksgiving together" (Talanoa, Participant C 2015); "it was important to thank the gods who have produced fruit of the land which allows us to work and provide money for our families" (Talanoa, Participant A, June 2013). The harvest prayers now attract all RSE workers throughout Motueka and it has grown into a community gathering thus allowing the participation of many members of the community to understand Māori rituals and the importance of relationships extending to giving thanks to the land.

Beyond the relationship with Māori are other relationships that the workers have with the community. Significant is the Church in which the team has decided

to have fellowship. Sundays are sacred and is a day of rest. Regular attendance at church provides the opportunity for workers to socialize with other parts of the community and for an extension of their social skills. Churches also make a big effort to integrate the workers into their communities and as Bedford reports (2013), the workers bring a vitality to what has been dwindling congregations. Churches have also been helpful for fundraising activities especially assisting in the financial cost of paying for a container to ship goods back to Tonga. Wakatū/Kono make a regular contribution to a container realizing that workers are actively developing opportunities to set up business activities upon their return home and require goods purchased in New Zealand to be sent to Tonga. These are the pillars of nofo 'a kāinga which extend to the group's commitment to the community. Wakatū/Kono continue to display manaaki, and at times, the workers are invited to share in many activities important to the tribe and whānau (family) days. Significant days of celebration such as Waitangi Day and Matariki (Māori New Year) are explained as is their historic significance. The workers participate at the activities of the marae and contribute through their singing and/or expertise in cooking certain Polynesian foods.

It is good to support Māori activities. (Talanoa, Participant E 2015)

We like to go to the marae and learn new things. (Talanoa, Participant D 2015)

One of the most traumatic events for the worker is when a loved one passes away while they are in New Zealand working, and over the years, the teams that have come to New Zealand under Wakatū/Kono have been witness to the tragedy that an event like this brings. Workers are faced with the decision of returning home or to continue to work in New Zealand where the money they earn can support high costs of hosting funerals where the exchange of gifts is essential to maintaining the prestige of the family. The loss of loved ones in any culture is devastating. In Tongan culture the vā which binds the kāinga are incredibly strong and intense and being absent from loved ones at this time can be a painful time. Should the worker remain in New Zealand, then special prayers, services, and acknowledgments are made. The elders from the Wakatū/Kono also attend and offer comfort and solace as they would in accordance with their own funeral practices. Should the worker decide to return to Tonga, then voluntary financial contributions (koha) assist with costs of flights and funeral costs. Wakatū/Kono have established a garden of remembrance with plants representing those that have passed on. The nofo 'a kāinga responds with 'ofa/love, ceremony, and in the embrace of the laumālie/'Otua (higher spirit) to help ease the grief process.

The Government have supported education for the workers through providing them with access to English literacy, numeracy, and financial literacy training with a provider called Vakameasina. Many programs are available such as Financial and Personal Goal Setting; Budgeting in New Zealand; Payslips and Deductions; Employee Rights and Responsibilities; Remittances; and Health and Safety, small business development. Teaching occurs outside of work hours; once a week for 2 h and is free. As opposed to other RSE workforces, the workers

recruited for Wakatū/Kono were not all from poor rural areas and many had good levels of English language ability and formal education at secondary school. They therefore chose courses on small business, computer training, and financial literacy. These training programs would stand them in good stead no matter what situation they would find themselves in as their commentary indicates “it was good to think through a business I can start up when I return home” (Talanoa, Participant E 2015); “my business plan was how to start a restaurant because I live near the airport and people have to drive past” (Talanoa, Participant D 2015). “I am glad that I know how to email now as I can stay in touch with family cheaply” (Talanoa, Participant A 2015).

While these are all commendable and the group as a whole has participated in these classes, at times the workers do struggle to attend and stay enthusiastic especially following a full day of hard work in the field. The merits of such training are however well appreciated.

In a 2011 Evaluative Report by Roorda undertaken on the training of RSE workers, some interesting issues emerged:

1. Workers come from cultures where the teacher knows everything, so don't question the teacher much.
2. (They) also don't want to lose face (by speaking out and getting something wrong).
3. X wanted to get to know them. X pushed the books aside and got them talking about their lives. An employer said they had received “overwhelmingly positive feedback” from workers about the tutor.
4. X made a connection with the learners. Comments from a range of respondents suggest the tutors were highly regarded by the participants. Workers in one interview commented (about one tutor).
5. One tutor commented, for example, that a group leader with “huge charisma” would have been insulted to have been placed in a beginner's group.

Within the Wakatū/Kono group, commentary on learning experiences have been similar:

We learn better when tutors value who we are and where we come from. (Talanoa, Participant E 2015)

Some stuff was boring but once I saw how I can create business opportunity in Tonga then I enjoyed the learning. (Talanoa, Participant A 2015)

It was good to practise English with supervisors. (Talanoa, Participant F 2015)

I liked the cooking class because we could eat what we made. (Talanoa, Participant B 2015)

What I learnt, then I could use it the next day. (Talanoa, Participant C 2015)

I like x. He treats us like adults who can think. And he expresses himself well. We know what to do. (Talanoa, Participant D, March 2015).

These comments indicate the need for the tutors to become familiar with the contexts of the learners, that relationships matter, that the workers come with their own worldviews and cultural capital. Again, these represent components of ako.

Ako – ki he vā kāinga: Workers Return to Family/Community in Tonga

Ako ki he vā kāinga concerns the preparation to return home after 7 months of working in Motueka. This requires planning which adds to the excitement and anticipation that such an event can bring. For many workers, their new financial literacy skills and education and training and work has prompted the thinking of creating opportunities for their return home. The daily reflection and planning that occurs without fail in the 7 months that the workers are in New Zealand include discussions of whether they reached their goals set at the selection meetings and possible business opportunities when they return to Tonga. This leads to planning and purchasing materials, tools, and other resources which will be shipped back by container. As well, there is the end of season reflection which they conduct with the Pou Awhina to assess how well they did in the workplace, in the home space as a team member in terms of enhancing the vā, and as a kāinga/community member.

It is also important for the worker to reflect and acknowledge the new learning that has been acquired informally and formally and how they will use and implement that once they return home. These reflections all contribute as to whether the worker will be invited to return for another season. These are conducted through Talanoa. In Tonga meanwhile, families also have been preparing themselves. Most transitions back to the families occur without incident because the vā has been in a state of continual nurturing.

Before departure Wakatū/Kono host the workers for a meal and ritual of thanks to show their appreciation to them for coming to New Zealand to work for them. Often a small gift is given. As the land welcomed them when they arrived, thus the land bids them farewell. They are invited to engage in a ritual which takes place before the God of Harvest, Rongo so that a blessing of the land can be given to them and their families as they make the return home. Their work for this season is now complete.

On arrival in Tonga, the nofo 'a kāinga ritual continues as the group and the family members that were nofo 'a kāinga in Tonga meet outside the airport to be welcomed home by the leader of the IMPAECT* in Tonga, to perform a prayer to mark the transition of the separate nofo 'a kāinga into one body in Tonga before a meeting at the lead person's home for a final thanksgiving and the sharing of food. This is the continuance of maintaining the vā with the land of Tonga and the higher spirits that maintain the cohesiveness of the kāinga.

For Wakatū/Kono, the IMPAECT* managed group of Tongan workers have proven to be loyal and productive workers. The relative productivity of these workers in comparison to published averages of earnings suggests a significantly higher performance of this group, with an annual average earning per worker of up to New Zealand \$20,000 versus published averages for other workers of between AUD

\$5800–AUD\$8400 (Bailey 2015). In terms of loyalty and obligations, IMPAECT* workers have had no breaches of RSE limited visa conditions in their nearly 10-year history of work. Given the industry average for breaches of a little less than 1% for this category of visa, this could well represent further evidence for the multidimensional benefits of establishing a sense of belonging and subscription to shared goals.

The Māori–Pacific Interface

The relationship between Māori and Pacific in New Zealand has largely been directed by the colonial project within which Māori and a number of Pasifika communities are rather tightly bound (McIntosh 2001; Somerville 2012). While there has also been a long history of cooperation and equally a long history of competition, Teaiwa and Mallon (2005) have described the recent history of Māori–Pacific relationships as ambivalent and fraught with political tension. Yet Māori are Pacific peoples too, indigenous to Aotearoa and indigenous to the Pacific Ocean. As Addis said the migration brought Pacific people to Aotearoa to be Māori (cited in Somerville 2012).

Rangiatea or Ra’iatea, an island of Tahiti, is the home of the ancient shrine which honored Io, the supreme god of Hawaiki Nui, the land from which Polynesian ancestors came from. Māori came from Hawaiki and it is the place to which they return. It is their physical and spiritual homeland. Arriving and settling in Aotearoa, they made sense of our world through implementing a set of practices whose blueprint was rooted in Polynesia. Members of groups from Hawaiki or old Polynesia sourced knowledge from that blueprint to adapt to new environments as the navigational feats resulted in epic journeys across the Pacific to new lands. Consequently, Māori and peoples of Polynesia share common ancestors, common gods, and common narratives. Māui and Tangaroa are good examples. Relationships to lands, seas, taniwha, tīpua, and Gods are similar as is respectful relationships between all living creatures and people.

In Māori rituals, Hawaiki is referred to as the wā kāinga, the distant homeland, the place in our distant time where Māori lived as Polynesian as one distinct people, where people gathered as kin to share food, its production, and its harvest. In whaikōrero (oratory) particularly at times of death, it is said “Hoki atu ki Hawaiki nui, Hawaiki pamamao” (return to the great Hawaiki, to the distant Hawaiki). Hoki atu ki te wā kāinga (return to the distant homeland). These acknowledgments of Māori as being from Hawaiki or the wā kāinga continues to be memorialized in Māori rituals and practices.

In the 1850s, Te Rangikaheke from Ngāti Rangiwewehi, a rangatira and a prolific writer wrote a letter to his people in Hawaiki after meeting a man named Maui Tione who introduced himself to Te Rangikaheke as being from Hawaiki. Although the letter was unfinished, we see some interesting markers of a relationship that Te Rangikaheke thought he had with his kin from Hawaiki. Te Rangikaheke was of the opinion that Māori had strayed from their roots, that the people from Hawaiki would be mutually interested in Māori and would reciprocate with generosity because of a

long-standing relationship. He desired to engage with the people and place from which his ancestors came from (Somerville 2012). Upon hearing that those in Hawaiiki had a ship, he requested that a ship load of food be sent to him so that he may eat the food of the place from which his ancestors came:

A, mea atu ahau ki taua tangata nei. “Ki te tae koe ki tōu kāinga, ki Hawaiiki, ina hoki I rongo atu nei au I tau korero he kaupuke ano to koutou: a, ki te tae koe ki reira, mea atu ki ou whanaunga kia homai to koutou kaupuke hei uta kai maku, kia kai atu au I nga kai o te kainga I heke mai nei o tatou tupuna o mua”. (Cited in Somerville 2012, p. 196)

Somerville (2012) explains this quote as connecting food with history and the nourishment as being both intellectually nourishing as well as physical and spiritual because of the relationship with ancestors. It is a powerful reminder to remember that as Somerville says, that Māori were once Pacific peoples.

Conclusion

In the context of today, the RSE scheme has as its central focus the production of food. For the Tongan workers, they come to this land to work on the lands for the prime reason to earn a livelihood that cares for the well-being of their kāinga in Tonga; to do so effectively, they organize themselves in New Zealand in a way that draws on their traditional kāinga model and implements ako; for Māori owners the land (made up of many kāinga) is their wealth and they have horticultural lands of which they are the kaitiaki and which provide an economic and spiritual base for their whānau. Both have a shared responsibility to invest in their relationship with each other and in so doing to have the well-being of their kāinga and whānau at heart.

In detailing Māori and Tongan world views, strong evidence exists of both parallels and complementarity. Furthermore, such parallels and complementarity allow for the generation of outcomes by those familiar to and receptive of the enactment of such values. Key outcomes can include a sense of obligation, accountability, and reciprocity. Related to these outcomes is the establishment of a sense of belonging through the deliberate and authentic application of Māori values and world views in stakeholder interaction. It is an ever-cycling process of reciprocal give and take and communal sharing and support. The exploration of tauhi vā concludes that this functional phenomena is consistently brought into being through action including initiating the concept of ako – all in a dynamic web that requires participants to continually reestablish lines of obligation and learning in its many manifestations. It is authentic, and ongoing acts of care and generosity continues to legitimize ongoing obligation to others across space, time, and generations.

In what may be regarded as a capitalist model, culture has helped negotiate successful outcomes. Two indigenous communities have worked in particular ways building on their known strengths and have been able to learn from each other. In so doing, they have taken a journey of revitalizing, reaffirming, reimagining, and deepening ancient cultural traditions.

Abstract

Yannarumi is a Ngarrindjeri concept that can be translated as “speaking lawfully as country.” It is fundamentally connected to understandings of peaceful relations and wellbeing. This chapter is a case study of Indigenous Nationhood. It explains how Ngarrindjeri use the *Yannarumi* concept to understand and assess the changing conditions through which they strive to educate the postcolonial public, and thereby negotiate a healthy life-giving relationship with Australian governments and other non-Indigenous agencies. The discussion is focused on contemporary forms of Ngarrindjeri public pedagogy and engagements with the settler State’s education systems. In order to speak lawfully and authoritatively for the wellbeing of their citizens and Country, and to exercise the responsibilities that come with the culturally fundamental interconnection between people, lands, waters, and all living things, Ngarrindjeri leaders have developed forms of political literacy, education, and life-long learning that strengthen Ngarrindjeri

capacity to create a healthy future as an Indigenous nation. This aspirational strategy is influenced and supported by experiences and knowledge from other Indigenous Nations in Australia, New Zealand, and North America. This chapter considers the potential of the Ngarrindjeri Yannarumi methodology to transform colonizing curriculum and assessment frameworks of school-based education that restrict Indigenous success by devaluing and negating Indigenous knowledges. It explains how Yannarumi principles can create new curriculum and assessment guidelines that align with Ngarrindjeri values and goals aimed at securing wellbeing for people, Country, and all living things.

Australian colonization · Aboriginal sovereignty · Education · Governance · Indigenous Nation re-building · Postcolonial reconciliation · Public pedagogy · Self-determination · Social transformation

Introduction

NOW TAKE NOTICE THAT
NGARRINDJERI HAVE ALWAYS OCCUPIED THIS PLACE
NGARRINDJERI HAVE NEVER CEDED NOR SOLD THIS LAND. (Excerpt from
Ngarrindjeri Declaration of Dominionium [1999](#), read publicly at Goolwa by Matthew Rigney)

Ngarrindjeri leaders have consistently asserted a responsibility to “speak as Country” as fundamental to a peaceful, healthy, and just life. This chapter explains how Indigenous “speaking as Country” potentially recalibrates colonial systems of knowledge formation and education, so that Indigenous perspectives are better represented through Indigenous agencies in shared processes of social construction. The chapter begins by situating Ngarrindjeri people philosophically in relation to the concept of *Ruwe-Ruwar*, the interconnectivity through which Ngarrindjeri life is part of the living body of lands and waters and through which the agency of *Yannarumi* emerges in speaking as Country. This philosophical understanding subtends Ngarrindjeri resistance to colonization, as was especially evident during their campaign of opposition to the building of a bridge over the spiritual waters surrounding Kumarangk (Hindmarsh Island) at the mouth of the River Murray in South Australia. The proposed development threatened the health of the River, the Lakes, and the Coorong and all connected living things (see Stevens [1995](#); Bell [1998](#), [2014](#), [2008](#); Saunders [2003](#); Hemming and Trevorrow [2005](#); Hemming et al. [2010](#)). This experience led to new Ngarrindjeri strategies for engaging with the settler State and new translation “tools” to support the Ngarrindjeri political project of nation (re)building. This political foundation has enabled Ngarrindjeri to better articulate and assert an Indigenous educative authority and a transformational public pedagogy based upon principles of *Yannarumi* or “speaking as Country.” The ultimate aim of this chapter is to explain how Ngarrindjeri *Yannarumi* provides a basis from which to transform learning frameworks into richer, healthier forms of education based on respect for

Indigenous knowledges. The multisited, multidimensional approach taken by Ngarrindjeri to Indigenous Nation re-building offers a “decolonial option” (Mignolo 2009) for transforming education. By applying a Ngarrindjeri *Yannarumi* assessment to current educational programs framed by a national curriculum and an associated assessment framework, Ngarrindjeri leaders can make informed decisions about their value to the Ngarrindjeri Nation. While the discussion focusses on the case of Ngarrindjeri, it also makes reference to the ideas and experiences of other Indigenous Nations and/or populations and their potential role in transforming colonial systems of education.

Ngarrindjeri Ruwe-Ruwar: An Indigenous Philosophy of Interconnectivity

Ngarrindjeri are part of the water. It is life, gives life, and is living. The cultural and spiritual relevance for Ngarrindjeri of water as a source of life and as part of the living body is that it flows, within, around and, through Ngarrindjeri country. The exercise of Ngarrindjeri cultural rights and the fulfilment of Ngarrindjeri responsibilities include being interconnected with and being part of the living water. The flow of water forms part of the interconnectedness of Ngarrindjeri to our country and the failure of water to flow into our country impacts upon our exercise of rights and our fulfilment of responsibilities as custodians of the land, water, and sky. (Ngarrindjeri Regional Authority, Murray-Darling Basin Plan Submission 242, 25th September 2015)

Ngarrindjeri are “water” people of the Coorong, Lower Lakes, and Murray Mouth region of South Australia. Ngarrindjeri knowledge has developed over thousands of generations, situated in/on/with Country, and growing from the lands and waters and all living things. Ngarrindjeri continue to pass on life-sustaining knowledge and cultural wisdom despite the oppressive constraints of a settler colonial system of education. Ngarrindjeri *Ruwe-Ruwar* is an Indigenous philosophy that encapsulates an interconnected system of being and knowing, while Ngarrindjeri *Yannarumi* expresses the cultural responsibility and political authority of Ngarrindjeri as agents of ethical interconnection (see Bignall et al. 2016).

A Ngarrindjeri philosophy of education can be situated in relation to these cultural concepts of life-water, flows, and connectivity. There are many layers and dimensions to this relation. At its most profound level of achievement, Ngarrindjeri education in postcolonial contexts involves fostering a place of teaching and learning where diverse epistemologies can come into contact enabling a creative mixing, as happens when “fresh and saltwaters meet” (Wilson 2010, p. 327). Indeed, Ngarrindjeri understandings of educational potential and responsibility in light of complex cultural concepts of connectivity, flow, and “Being as Country” share aspects in common with the knowledges of other Indigenous peoples. Thus, Kaurna Elder Uncle Lewis O’Brien “using the same metaphor as former Council of Reconciliation Chairperson, Patrick Dodson, and paralleling the Yolngu concept of *ganma* – talks of the meeting of salt and fresh water when he explains the complexity

and richness of Indigenous cultural knowledges and their relationship to dominant non-Indigenous epistemologies” (Worby et al. 2006, p. 423). The pedagogical dimensions made possible by the metaphorical meeting of the waters must necessarily be a “respectful coming together of Indigenous and non-Indigenous peoples and their cultures in full awareness of and resistance to the lasting impacts of colonisation” (Worby et al. 2006, p. 423). A respectful coming together “includes elucidating the habits of mind that foster reconciliation, a vocabulary for reconciliation, and an understanding of the habits of reconciliation practices” (Hattam and Matthews 2012, p. 11). This meeting of “waters” – or knowledge systems – refuses purity, binary oppositions, and totalizations, instead bringing various streams together. As the Sami philosopher Rauna Kuokkanen explains: “With this approach, we aren’t required to keep one discourse and throw out the others. It is at the confluence of these various shifting streams – discourses and intellectual conventions” that we seek to work (Kuokkanen 2008, p. xiv). This “place” is not situated in a geographical sense: rather, it is a metaphorical space imaging a relational way of being that is enacted in each moment of living. Similarly, in her critique of the Australian curriculum, Gamilaraay/Yuwaalaraay citizen Sarah Loynes draws on her ancestral knowledge to image the fluid process of knowledge formation and the ways in which knowledge is influenced and constrained by the context in which it operates:

with the waterways representing my current journey ... The waterways represent students (and their pathways); the terrain/landscape represents curriculum knowledge and practice; the mountains are the curriculum policies and policy makers; the sea is the economy/workforce that students are being prepared for (but so much more than this also); and the layers in the landscape represent the potential knowledge that could enrich the curriculum through deeper and more honest engagement with places and Peoples. (Loynes speaking in Lowe et al. 2014, p. 59)

The river is imaged in these various Indigenous narratives as a source of physical, spiritual, and mental sustenance and wellbeing, which nourishes its people physically, spiritually, intellectually, and emotionally. The river is “simultaneously an exterior landscape and an interior one. It shapes both our activities and our thoughts. It affects our daily lives as well as the stories that tell us who we are” (Kuokkanen 2008, p. xiii). The river “is a concept-metaphor” that suggests fluidity and “assists thinking and analysis,” allowing “movement” in and out of multiple discourses and intellectual traditions. It resists confinement and control: we can be “carried away by various streams and currents” (Kuokkanen 2008, pp. xx–xxi). The river erases the borders of binary dualisms, allowing the fusion of “various theories and critical approaches without getting stuck in rigid categorizations or dichotomies” (Kuokkanen 2008).

From a Ngarrindjeri perspective, the place of the “meeting of the waters” is:

fundamental to the Ngarrindjeri world where all things are connected, whether they are living, from the past and/or for future generations. The Meeting of the Waters makes manifest core concepts of Ngarrindjeri culture that bind land, body, spirit, and story in an integrated, inter-functional world. (Ramsar Convention Secretariat 2011)

The river reflects a worldview that the Ngarrindjeri share with many other Indigenous nations, in which nature and culture, human and nonhuman, are indivisible and not part of a western binary ways of knowing and being (see Bignall, Hemming, and Rigney 2016). It is a place of flow and interconnectivity that bears both the continuing care of Ngarrindjeri and the scars of continuing colonization.

Colonization of Ngarrindjeri Ruwe/Ruwar: Breaking the Flow

The State of South Australia, and the education systems that work through it, fundamentally interrupt Ngarrindjeri lifeways by imposing western philosophies of being that separate humanity from nonhuman life and reduce lands, waters, and all living things to resources in an unsustainable capitalist economy. The colony of South Australia was established by the sovereign authority of imperial Letters Patent, signed by the British King William IV in 1836 (Berg 2010; Rigney et al. 2015; Bignall et al. 2015). Although the Letters Patent formally recognize Indigenous occupation and original land rights, this original recognition was subsequently forsaken as the nascent colony developed, and consequently South Australia has no treaties or regional land rights legislation (Hemming and Rigney 2010, pp. 91–92). Although it has recently announced its renewed commitment to honoring the promise contained within the founding authority of the Letters Patent by recognizing Indigenous rights through a process of Treaty with the Indigenous Nations in its jurisdiction, the State of South Australia is yet to negotiate a just settlement with Indigenous nations. Likewise, the Federal Government has not entered into Treaty with Indigenous Australians. This unresolved issue of governance remains critical in any discussion of education, collaboration, and engagement with the nation State. In the context of teaching and learning, the unresolved issue of Indigenous rights manifests in an education institution that is yet to acknowledge the sovereignty of Ngarrindjeri or other Indigenous peoples. Consequently, the public education system negates, distorts, and underrepresents the values and principles of Ngarrindjeri education and knowledges (Education Department of South Australia 1989, 1990, 1992).

It is therefore unsurprising that until comparatively recently, non-Indigenous authorities have ignored, discredited, or failed to understand Ngarrindjeri voices speaking about the ecological and cultural significance of their Country where the “Meeting of the Waters” takes place (see Stevens 1995; Bell 1998, 2014; Simons 2003; Rigney et al. 2015; Hemming et al. 2016). Colonial processes of denial and erasure not only occur across the physical spaces of environmental management impacting on places such as the “Meeting of the Waters,” but also extend across multiple discursive fields and sites of engagement in the contemporary contact zone (Hemming 2007; Hemming and Rigney 2008). In the field of education, efforts to assert educational values from Ngarrindjeri perspectives – to speak as Country in educational contexts – have often also been met with incomprehension and refusal. Education work – both continuing the education of Ngarrindjeri peoples as

a community, and educating the settler State – is fundamental to Ngarrindjeri efforts to “assert, negotiate, or protect interests” in Country.

The colonial education system has too often positioned Indigenous learners as lacking knowledge and capability (Vass and Chalmers 2015). These assumptions about the education deficit and incapacity of Indigenous people, and actions to contain the education of Indigenous people within Euro-western frames, are still evident in, for example, existing policies such as “Close the Gap” (Department of the Prime Minister and Cabinet 2016). Here, Indigenous learners are assumed to lag behind a non-Indigenous standard and need to catch up by assimilating to “white” ways of being, knowing and doing, and education assessment practices such as NAPLAN (which measure Indigenous children according to Euro-western standards that negate Indigenous ways of being knowing and doing). Such policies and assessment practices continue to position the postcolonial state as paternalistic “protector” of Indigenous peoples while denying Indigenous rights to determine the educational wellbeing of people, lands, and waters. These colonizing practices are accompanied by the settler colonial occupation and control of Indigenous lands and waters and attempts to sever the integral link that Indigenous peoples maintain with Country.

Even while their Indigenous systems of knowledge formation and teaching persist – albeit informally – alongside the colonial systems of education, Ngarrindjeri remain caught in a colonial situation where children are required to participate in a formal state education system “structured by colonial institutions and their associated forms of knowledge” (Moore 1993). These have “funnelled social understanding through narrow pathways towards a predetermined outcome of cultural extinction” (Hemming et al. 2016, p. 6). The formal education system is yet to provide any opportunity for Ngarrindjeri to be Ngarrindjeri in a Ngarrindjeri way. For Ngarrindjeri, enabling Indigenous authority in the field of education requires the development of new kinds of relationships with the nation state and its colonial governments, which in turn requires Ngarrindjeri and colonial powers to work together across multiple dimensions and on multiple fronts. Postcolonial reconciliation calls Australians collectively to change the shape of institutions and technologies, philosophies, and literacies.

Scope for a more just form of postcolonial acknowledgment of Ngarrindjeri knowledges, authority, and values stirred in 2001: the Federal Court at this time reconsidered Ngarrindjeri traditions associated with the “Meeting of the Waters” at Kumarangk. It concluded, contrary to its earlier findings in the Hindmarsh Island Bridge Case, that Ngarrindjeri knowledges were not fabricated and that the meeting of the waters are part of “genuine Aboriginal tradition” (Hemming et al. 2016, p. 7). The Court thereby formally acknowledged that this “genuine Aboriginal tradition” has been passed on through Ngarrindjeri processes of education over thousands of generations. More recently, and building upon this early gesture towards legal recognition, the Ngarrindjeri Nation has engaged in a political strategy which uses contract law agreements to negotiate non-Indigenous responsibility to engage respectfully with Ngarrindjeri beliefs and traditions. These formal and binding accords are known as Kungun Ngarrindjeri Yunnan Agreements (KNYA – Listen

to Ngarrindjeri Speaking), and this innovative development in jurisprudence has shifted the South Australian Government's monolithic grasp on authority by enabling Ngarrindjeri to resume a leading role in Caring for/as Country (Hemming and Rigney 2011; Hemming et al. 2010, 2011; Trevorrow and Hemming 2006). This is important for postcolonial reconciliation, social advancement, and sustainability:

greater appreciation by non-Indigenous society of Indigenous knowledge as a valuable contribution to world knowledge can lead to productive cross-cultural philosophical alliances that bring together sympathetic understandings of the conditions of sustainability, inspiring new approaches to environmental stewardship and enabling more participatory alternatives to top-down, centralised environmental management. (Bignall, Hemming, and Rigney 2016, p. 274)

This shift in cultures of governance and authority is of crucial importance to the continuation of Ngarrindjeri education in the face of continuing colonial policy. Through their work on Country and with leaders from government and key organizations who make decisions about Ngarrindjeri Country and act upon these decisions, the Ngarrindjeri Nation is shifting the way Ngarrindjeri Country and people are understood. This work requires both the continuation of Ngarrindjeri traditions of teaching and learning and the generation of new forms of education and negotiation in response to changing demands created by legacies of colonization and its related impacts upon land, waters, people, and all forms of life (see Ngarrindjeri Nation 2016; NRA 2012, 2014; NRA et al. 2016). Education, like Caring for/as Country, is a social obligation for which Ngarrindjeri, as a Nation, are responsible.

The following section discusses a recent shift in the Ngarrindjeri approach to teaching and learning: from one detached from, and at odds with, the institutions of the colonial nation state that has employed a racialized binary logic stripped of *Ruwe-Ruwar*, to one that claims Aboriginal sovereignty and attempts to collaborate and educate from a standpoint of Indigenous cultural authority. Ngarrindjeri knowledge, philosophy, science, and experience are increasingly articulated through a practice of *Yannarumi*, "Speaking as Country." This provides a transformative methodology for rethinking education from a Ngarrindjeri perspective.

***Yannarumi* as Public Pedagogy: Speaking and Acting Lawfully as Country**

Public and political recognition of the value of Ngarrindjeri knowledge has not come easily, but rather is the result of an intensive campaign of research, publication, political negotiation, and public education intended to drive a process of postcolonial transformation. The notion of "*Yannarumi*" sits as the cornerstone of this campaign. *Yannarumi* is a Ngarrindjeri concept which can be translated as "acting or speaking lawfully as Country." It is fundamentally connected to understandings of peaceful relations and wellbeing. By Speaking as Country – when land is conceived as an entity that is never separate from the autochthonous peoples with which it is

connected – Ngarrindjeri act lawfully and authoritatively according to the principles of ecological interconnectivity that define their sovereign responsibility to live carefully in relation to their lands and waters. *Yannarumi* exercises the collective right and obligation of Ngarrindjeri to protect, preserve, and foster all of the life-forms that are sustained by their Country, including the cultural life of the community itself. Simultaneously, the relational perspective articulated in *Yannarumi* assists Ngarrindjeri to work through potential conflicts, misunderstandings, and problematic engagements. *Yannarumi* therefore asserts the rightfulness of Ngarrindjeri ways of being and knowing, based on *Ruwe-Ruwar* as an Indigenous philosophy of relationality or interconnection.

Yannarumi is a practice of balance and connection: things and situations should be understood and expressed in terms of their potential for forming reciprocal relations that reproduce wellbeing for individuals, as well as sustaining the environments and ecologies in which individuals participate. Ngarrindjeri people are an integral and inseparable part of Ngarrindjeri lands and waters. They have an abiding responsibility to sustain the ecological health of Country that defines their existence as such: “For Ngarrindjeri ‘wise-use’ requires practicing a lawful, respectful, and reproductive life that respects the Creation Stories handed down from the Kaldowinyeri (Creation)” (Hemming and Rigney 2016, p. 5). *Yannarumi* articulates the Ngarrindjeri responsibility to act and relate in a way that cares mindfully for the interconnected being of *Ruwe-Ruwar*, as was conferred at the beginning of time by creation ancestors such as Ngurunderi (Hemming and Rigney 2012, p. 186):

Ngarrindjeri must follow the Traditional Laws; we must respect and honour the lands, waters and all living things. Ngurunderi taught us our Miwi, which is our inner spiritual connection to our lands, waters, each other and all living things, and which is passed down through our mothers since Creation. (Ngarrindjeri Nation 2007, p. 8)

A twofold implication of *Yannarumi* for education becomes apparent at this point. Firstly, *Yannarumi* requires the education of Ngarrindjeri citizens in their own culture, history, and the ways of their Nation. Ngarrindjeri students need familiarity with their Creation stories and the obligations and rights established by the ancestors, if they are to act effectively as citizens of the Ngarrindjeri Nation and thereby to speak with authority and confidence as Ngarrindjeri in relation to non-Indigenous society. Secondly, *Yannarumi* subtends an important “reconciliation pedagogy” (Hattam and Matthews 2012) in South Australia. This involves Ngarrindjeri engaging with the non-Indigenous publics and agencies now cohabiting on Ngarrindjeri Country, in order to teach the principles and perspectives of right conduct and environmental science that Ngarrindjeri have developed over eons of occupation and have long used successfully in sustainable natural resource management. Integral to this process of public education is the assertion of *Yannarumi* as an authoritative Indigenous agency of social expression and construction, coupled with the re-centering of *Ruwe-Ruwar* and the dismantling of colonial logics that are based on a false divide between people and Country. The results of this work have produced significant changes in relations between Ngarrindjeri and the settler-State.

Ngarrindjeri *Yannarumi* or Speaking as Country therefore has an historical meaning, but is being reconceptualized in a contemporary form by Ngarrindjeri leaders to take into account the impacts and changes that have occurred to Ngarrindjeri *Yarluwar-Ruwe* (Sea Country) as a result of colonization. The continuity of Indigenous laws, values, and traditions is reinforced in the following excerpt from the *Ngarrindjeri Nation Yarluwar-Ruwe Plan* (2006, p. 11):

Our knowledge of Sea Country will continue to underpin our survival and our economy. Tendi, our formal governing council, ensured and will continue to ensure our stable and sustainable society, which maintains our obligations to Sea Country.

When Ngarrindjeri meet to “Speak as Country” about things that impact on the wellbeing of Ngarrindjeri *Ruwe-Ruwar* (lands, waters, body, spirit, and all living things), judgements are made based on the cultural principles passed down by the ancestors. This group of leaders and elders is traditionally called the *Tendi*, and when it meets, speaks, and makes decisions this is known as *Yannarumi* or Speaking as Country. It is the responsibility of Ngarrindjeri leaders to make decisions that ensure the wellbeing of Ngarrindjeri *Yarluwar-Ruwe*. The *Tendi* (the traditional governance board of the Ngarrindjeri Nation) has a formal position as part of the board of the contemporary national peak body, the Ngarrindjeri Regional Authority (NRA). The NRA Board is made up of representatives of Ngarrindjeri member organizations, key representative committees, and elected representatives from the wider Ngarrindjeri nation. Today the NRA takes responsibility for assessing whether something is healthy, lawful, and creates wellbeing for the Ngarrindjeri nation. This assessment of projects, practices, partnerships, plans, and other activities is conducted with the wellbeing of Ngarrindjeri *Ruwe-Ruwar* (body, spirit, lands, and waters and all living things) as its objective. As stated in the *Ngarrindjeri Nation Yarluwar-Ruwe Plan* (2007), Ngarrindjeri leaders have always worked this way, following the laws of the Creation Ancestors and guided by Elders.

Ngarrindjeri livelihoods, culture, and wellbeing depend on exercising their cultural agency. With this in mind, the NRA has identified key goals that uphold *Yannarumi* as the expression of this cultural responsibility, and which aim to safeguard healthy *Ruwe-Ruwar* in: Strong Culture, Sovereign First Nationhood, a Secure Future, Healthy Country, Confident People, Creative Economy, a Respected History and Regional Leadership. These principles reflect and respond to Ngarrindjeri understandings about the interconnectivity between people and Country (Hemming and Rigney 2016, p. 34). With these overarching goals in mind, the NRA has developed a “*Yannarumi* assessment framework,” which it uses to evaluate the beneficial capacity – or the detrimental effects – of programs, policies, and relations with non-Indigenous institutions including law, research, and education.

Taking into account the continuing impacts of colonization on Ngarrindjeri *Yarluwar-Ruwe*, Ngarrindjeri believe healing programs and healthy flows are encouraged by a set of criteria that support respectful intercultural engagement. They foreground: *Kaldowinyeri*, in projects and engagements that respect Ngarrindjeri knowledge, law, tradition, and expertise; *Ruwe-Ruwar*, in projects and programs that

increase the health of *Yarluwar-Ruwe* by understanding and respecting the principle of interconnection; *Miwi*, in projects and relationships that bring energy, health and wellbeing into Ngarrindjeri lives; *Yannarumi*, in projects and engagements that build Ngarrindjeri capacity to Care for/Speak as Country to benefit lands, waters, and all living things; and *Ngiangiampe*, in projects and processes that build respectful relationships between Ngarrindjeri and other parties such as the State Government (Hemming et al. 2015). These elements are “assessed” in terms of their contribution to – or realization of – *Kaldowinyeri*, the life giving flow of Creation; and *Parpun miwi* which relates to a yearning for wellbeing in the face of destructive forces of colonization of country and peoples. When *Kaldowinyeri* is respected, the interconnection of lands, waters, body, spirit, and all living things expressed through *Ruwe-Ruwar* is *pritji* (strong) and *katjeri* (beautiful and healthy). The *miwi* spiritual connection is *pritji* (strong). *Rupelli* (Elders) *Yannarumi* (speak as Country) and *Ngiangiampe* relationships and governance are strong through *Tendi Nguldun*, the Ngarrindjeri Nation’s own healthy governance and agreement making structures. When creation is strong, Ngarrindjeri *Yarluwar-Ruwe* is *katjeri* (beautiful and healthy).

When, however, the “smog of colonization” (Wilson 2010) is the overwhelming force and the reproductive flows of creation are inhibited, then *parpun miwi*, the people and land are hurt and depleted and long for wellbeing. *Ruwe-Ruwar* is depleted and the *Wurreng-wulun* spirit connection is sorrowful. Colonization inhibits speaking and acting as Country. Colonial forces impede the healthy and culturally responsible management of Ngarrindjeri *Ruwe-Ruwar*, and colonization leads to *blewiliun* (unhealthy) and *Wurangi* (disrespectful) *Ngiangiampe* partnerships and relationships. For a particular context of action or experience, *Yannarumi* asks: what must be maintained so that Ngarrindjeri can always be a living part of Country? In each engagement, Ngarrindjeri seek to remain agents, and the engagement is therefore assessed primarily in terms of its respect for Ngarrindjeri agency, which is reflected chiefly in the capacity for Ngarrindjeri people to “speak as Country.”

A Ngarrindjeri-centered evaluation framework for the purpose of transformative education thus brings into contemporary being a set of ideas and evaluative criteria that have been around for tens of thousands of years. By employing this evaluative framework to discern current projects, processes, institutions, and relationships that work to benefit Ngarrindjeri, the NRA is influencing a change in its relationship with colonial authorities. In many instances, settler agents of government are legally bound by contract law agreements to “kungun Ngarrindjeri yunnan”: to listen to Ngarrindjeri “speaking as Country” and telling of their experiences of unsuccessful colonial policies in the past, and their expectations for self-governance and a role in the management of Country in the future. The evaluative framework further helps partners in a relationship to identify points of resonance and agreement as well as trenchant sites of disagreement that are culturally significant and must not be ignored or erased. This provides a foundation for finding future accord, enabling a movement of general action to shift the Indigenous-colonial conflict in the direction of de-colonial partnership.

When pedagogy remains centered on colonial interests and concepts, when Ngarrindjeri education is inserted into a colonial frame, then Ngarrindjeri knowledge is not shared. Rather it is simultaneously negated and possessed by colonial authority. A *Yannarumi* approach orients knowledge and understandings of “truth” away from colonial violence, conflict and competition, and toward a respect for *Kaldowinyeri*, the creation. *Yannarumi* centralizes Ngarrindjeri agency where colonization has marginalized it, and it enables partners in a relationship to share knowledge, philosophy, and experience to the potential wellbeing of everyone. The enactment of *Yannarumi* engages the nation state and other collaborators in a practical exercise of Ngarrindjeri sovereignty, manifesting in a transformation of (post)colonial relationships. Thinking through *Yannarumi*, an education process becomes visible as both a strategy of resistance against the components of a system that does not value Ngarrindjeri knowledge, at the same time as it is a strategy of teaching principles of partnership (Education for Social Justice Research Group 1994). The process of education is underpinned by a political and legal strategy made necessary in the colonial context: this asserts a rightful Indigenous presence and the just responsibilities that accompany that presence. Ngarrindjeri Nationhood and self-governance begins from the claim that Ngarrindjeri people have never ceded sovereignty of Ngarrindjeri lands and waters and thus remain sovereign. The Ngarrindjeri Regional Authority’s partnership with non-Indigenous government at all levels is based on an assertion of First Nationhood (see Ngarrindjeri Nation 2007). “Identifying, organising and acting as a Nation” (Cornell 2015) enables Ngarrindjeri “to express in an amplified voice their expectations for the protection of their Country and its well-being” (Bignall et al. 2016, p. 468). This has involved productive negotiations with the Department of Environment, Water and Natural Resources to better protect Ngarrindjeri *Ruwe-Ruwar*. Through *Yannarumi*, Ngarrindjeri attempt to speak sovereignly, as Country. This sovereignty is extended in multiple spaces: physical, theoretical, social, environmental, educational, and economic. Given the interrelatedness between people and Country, it is hardly surprising that Ngarrindjeri education work draws on and grows from work in caring for/as Ngarrindjeri Country. Teaching and learning as/on Country challenges the actions behind the language and concepts used to plan and conduct education, regenerating a sense of being, knowing, and doing in ways that do not discount the histories, economies, skills, and visions of Indigenous nations. By centering on the philosophy of *Ruwe-Ruwar* and the ethical agency carried by that philosophy, human actions flow and weave in relations of reciprocal benefit with the actions of lands, waters, and all forms of life. Education is both a connector and a translator of the *Yannarumi* process, and a mode through which other connectors are translated and imparted. Key aspects of this shift are outlined below, with particular consideration given to how *Yannarumi* provides a foundation for rethinking a postcolonial system of education through an intercultural curriculum and an expanded framework of assessment for educational achievement. However, to appreciate the radical nature of this shift in settler-colonial Australia, it is first necessary to understand how the contemporary curriculum continues to support a set of colonial attitudes and practices.

Neo-colonialism and the Contemporary Curriculum: “Closing the Gap”

The Australian curriculum has long functioned as a “vehicle for inculcating acceptance” of the social and economic interests of the (neo)colonial nation state. Typical to this formula is the positioning of Indigenous people as temporally, intellectually, and morally backward in relation to the standards and achievements of the colonizing society (Yunkaporta speaking in Lowe et al. 2014). According to the current Australian Curriculum (Australian Curriculum and Reporting Assessment Authority (ACARA) 2016):

The Australian Curriculum sets consistent national standards to improve learning outcomes for all young Australians. The Australian Curriculum and Reporting Assessment Authority (ACARA) acknowledges the gap in learning outcomes between Aboriginal and Torres Strait Islander students and their non-Indigenous peers. It recognises the need for the Australian Curriculum to provide every opportunity possible to ‘close the gap’.

Lowe and colleagues point to the way “the gap” operates in educational and broader political discourse by a comparative assessment of Indigenous and non-Indigenous performance that serves a neoliberal and neo-colonial agenda:

There will always need to be an achievement gap to maintain the system, just as in economics there must always be more demand than supply to create growth; there is both a figurative and literal link between the gap and the economic problem to be found here. Additionally, as the continued existence of colonies (particularly illegitimate ones without treaties) depends to a large extent on preventing unassimilated Indigenous people from gaining access to the social goods and codes of the powerful, it is unlikely that the deficit logic focus on closing the gap for Indigenous students will produce any significant change in the near future. (Lowe et al. 2014, p. 63)

The implicit logic of the “closing the gap” discourse reinforces perceptions of Western (colonial) superiority against Indigenous deficit. There is an assumption that Indigenous peoples *require* state assistance. Indigenous incapacity is naturalized and pathologized, thereby eliding a colonial history of Indigenous dispossession, attempted cultural annihilation, and systemic impoverishment as the actual source of contemporary Indigenous disadvantage.

Yunkaporta (speaking in Lowe et al. 2014, pp. 67–68) notes how “deficit thinking” is “internalized deep within us and it is an addiction that is hard to break. It is even harder to break for colonists, who need us to be primitive in order for them to seem developed and therefore morally legitimate in their occupation of the continent. This deep need and the globalising agenda that feeds it is intimately tied up with curriculum and education in an historical sense.” Yunkaporta calls for “a narrative reframing of the history of education and nation-building, suggesting that the two are intimately bound together, so much so that any change in curriculum along the lines we are suggesting here would have ramifications for Australia far beyond the realm of schools and schooling” (Yunkaporta speaking in Lowe et al. 2014, p. 68). Likewise, an approach based on Indigenous self-determination and cultural

authority, expressed in concepts such as *Yannarumi*, opens possibilities for transforming deficit thinking into education for wellbeing.

Australia has a national curriculum that is intended to guide subject content and skills through a three pronged approach comprising “key learning areas,” “general capabilities,” and “cross-curriculum priorities” (ACARA 2016). There are three cross-curriculum priorities, namely, “Sustainability”; “Asia and Australia’s engagement with Asia”; and “Aboriginal and Torres Strait Islander histories and cultures.” However, the naming of Aboriginal and Torres Strait Islander Histories and Cultures as a “priority” appears as a twist of jargon, given that these are an optional, unassessed “priority” that “occupy a perennially precarious space in the emerging Australian Curriculum (Salter and Maxwell 2016, p. 297).” The cross curriculum priorities are “simultaneously constructed as both important ‘priorities . . . embedded in all learning areas’ by the curriculum development body, the Australian Curriculum and Assessment Reporting Authority [. . .] and optional electives with ‘no requirement in the Australian Curriculum that subjects be taught through the cross-curriculum priorities’ by the chair of this same authority” (Salter and Maxwell 2016, pp. 296–297).

The Australian Human Rights Commission (2011) expressed its views in an earlier submission to the ACARA regarding consultation on the cross curriculum priorities:

it is critical to explicitly acknowledge in the priority, the historic and contemporary impact of colonisation and discrimination against Aboriginal and Torres Strait Islander Peoples and communities. While positive representations of Aboriginal and Torres Strait Islander histories and cultures are vital, the continuing impact of the process of colonisation on Aboriginal and Torres Strait Islander Peoples must also be acknowledged and understood. This is a critical step towards dispelling racist attitudes and fostering cross-cultural understanding.

The Australian curriculum, however, has not facilitated learning about the colonization, dispossession, or sovereignty of Indigenous peoples in any substantial or contextualized way:

In place of the truth about our legitimate and autonomous peoples, school students are provided with a truncated portrayal of Aboriginal people, stripped of specific social, spiritual and epistemic connection, and with a skewed and aggregated understanding of the Aboriginal experience of culture and identity. (Lowe et al. 2014, p. 64)

As Lowe and Yunkaporta (2013) observe, references to Indigenous peoples and cultures are, by and large, tokenistic and insubstantial. They echo Ngarrindjeri scholar Christopher Wilson’s observations on how the Nation State’s educational institutions continue to gloss over Indigenous knowledges:

There were days when the school would celebrate “cultural difference” and engage in “Aboriginal activities” such as dot painting and listening to Indigenous music, but in hindsight these activities did not truly capture the significance of Indigenous cultural practices within Australia. (Wilson 2010, p. 328)

Such an approach fails to convey the sense or embodied density of “speaking as Country” as a socially constructive activity in which Indigenous perspectives are not optional exotic alternatives to a naturally dominant framework of understanding, but are instead equally centered and authoritative cultural points of view in a non-hierarchically valued and genuinely shared curriculum.

Indigenous high school student Sarah Loynes has expressed how “Reclaiming Indigenous knowledge in the curriculum . . . is about being critically aware of all the layers of the curriculum landscape. Enforcing a narrow state of awareness through curriculum limits critical thinking and independent learning, which are optimal learning orientations no matter what culture you come from” (Loynes speaking in Lowe et al. 2014, p. 78). And yet, as Foley and Muldoon (2014) have discussed, even when the curriculum does point to Indigenous justice and rights, as it does, for example, in the current Year 10 History unit on “Rights and Freedoms,” Indigenous political achievements typically are not sufficiently represented. The authors note how “In addition to demands for civil rights (such as freedom of movement and equal treatment before the law), Indigenous political struggles have for centuries been fought over rights to land and self-governance. In contrast to civil rights, these rights are premised on the unique status of Indigenous peoples in relation to the colonial state. They are collective Indigenous rights, not individual rights premised on citizenship” (Foley and Muldoon 2014). This element within the current curriculum includes reference to “the struggle of Aboriginal and Torres Strait Islander Peoples for rights and freedoms before 1965, including the 1938 Day of Mourning and the Stolen Generations” (ACARA 2016); yet as Foley and Muldoon also point out, for students to understand this topic from Indigenous perspectives, they require further knowledge of colonial history including, for example, an understanding of how Aboriginal people suffered a deep loss of sense of self when they were moved onto state-run reserves and missions to open up their Country for colonial confiscation, re-possession, and development. This kind of understanding can only be developed by listening to Indigenous people “speaking as Country.”

Another disturbing absence from the curriculum is the continuing “silence on land rights.” While Mabo is mentioned, “the historic Mabo decision cannot be understood without the history of the land rights movement, from early frontier warfare, to the 1966 Wave Hill walk-off, to the 1972 Aboriginal Tent Embassy” (Foley and Muldoon 2014; see also Anderson 2007). This “silence on land rights” also hollows out the curriculum’s capacity to adequately recognize Indigenous connection to Country (ACARA 2016). Thus, while the settler-colonial curriculum claims to affirm the importance of Indigenous histories and cultures, a closer study of curriculum content suggests such claims lack context and substance because the curriculum does not foreground Indigenous *political* authority and activity.

According to Lowe (2016), if we aggregate the national curriculum content from kindergarten to year 10 and analyze the colonial narrative and how conflict is represented, it becomes apparent that this narrative has nothing much to tell of the history of colonial management of Indigenous people, of how Aboriginal people were pushed off their land and onto missions where they lived off rations and their social, economic, and family lives were under state control, or of how Aboriginal

people resisted these colonial techniques. Mention of the “Stolen Generations” is sparse and unsubstantiated, leaving students uneducated as to the lived effects of this policy, how it came to be, and how its impact is ongoing. There is no mention of labor exploitation. There is little mention of the impact of institutional control on the social and cultural life of Indigenous peoples, nor of Indigenous community agency to resist that colonial control. In problematizing how Indigenous content is addressed in the National Curriculum, Lowe (2016) identifies “a language of subterfuge and avoidance.” This comprises a reluctance to affirm the continuing existence of Aboriginal peoples as contemporary and future-oriented, and a denial of what actually happened in colonial history, particularly in its institutional form. The curriculum decontextualizes content so that the sense of the locality of what has occurred is lost. Through the language of omission, the racial dimension of social interactions is ignored. This legitimates and privileges the settler colonial presence such that white perspectives and knowledges engulf Aboriginal perspectives, knowledges, and peoples. In this way, the national curriculum constructs a Eurowestern version of legal and moral legitimacy over Indigenous sovereignty (Lowe 2016). The current Australian curriculum (ACARA 2016), as an integral component of the colonial matrix of power (Mignolo 2009), continues to exert control over Indigenous peoples and to reshape Indigenous identities and knowledges according to colonial interests (Lowe et al. 2014; Moreton-Robinson 2004). There is little sense of the richness, diversity, and expertise of Aboriginal and Torres Strait Islander peoples “speaking as Country.” There is a distinct lack of appreciation of how ancestral knowledge and connection to Country has survived and how such knowledge remains critical for sustaining ecologies and to the wellbeing of all of us today. Ball (1983), Battiste (2000, 2012), Grande (2004), and Nakata (2011) each note how the nation state’s tight control of the curriculum in its own colonial interests has led to a denial of the legitimacy of the knowledge of Indigenous peoples. This continues to have a destructive impact on Indigenous students’ engagement and achievement at school. The national and international literature suggests “an unequivocal link between culturally unresponsive curriculum and the largely uninterrupted trajectory of Indigenous student underachievement” (Lowe et al. 2014, p. 65).

The National Assessment Program – Literacy and Numeracy (NAPLAN) was introduced in Australia in 2008 and remains the overarching national Australian system of school assessment. NAPLAN assesses students across four domains: reading, writing, language conventions (spelling, grammar, and punctuation), and numeracy. Like large scale testing systems elsewhere in the world, the educational assessment focus of NAPLAN is largely reduced to numeracy and literacy. It is conducted through yearly census testing of Years 3, 5, 7, and 9 students in all Australian states (Lingard et al. 2016). This system of assessment has particularly marked effects on Indigenous students. Lingard et al. (2012, p. 327) refer to the “apparent continuance of deficit thinking, resulting in a “student-as-problem” framing of education policy focused on “Indigenous education”” in which “. . . placing emphasis on measurable and incremental improvements in attendance and retention displaces discussion of the circumstances underpinning why education itself is viewed as a context to be avoided in the first place by many Indigenous students”

(Lingard et al. 2012, p. 327). By maintaining a narrow literacy and numeracy focus, the knowledge and aspirations of Indigenous students that flow outside of this focus are negated and neglected by educators and authorities. A particularly worrying concern about NAPLAN data is that “the heaviest weighted ‘disadvantaging’ variable is ‘the number of Indigenous people living in the community where the school is located’” (Lingard et al. 2012, pp. 327–328). Consequently, schools with higher numbers of Indigenous students are identified as lower status schools: “policy-makers maintain and propagate a belief that Indigenous students (and communities) are a ‘problem’ that negatively impacts on educational outcomes” (Lingard et al. 2012, p. 328). Through this matching of Indigenous student numbers with low school status, the presumed success of non-Indigenous students is set against an assumed failure of Indigenous students to reach white standards, with the “blame” for low performance being placed on Indigenous peoples as the bearers of (natural) disadvantage. Accordingly, it is “hard to view NAPLAN in its current form as anything other than a force that protects and operates as a (re)colonising presence in Australian education” (Vass and Chalmers 2015, p. 150).

Lingard et al. (2016) have observed how testing programs such as NAPLAN need to be considered as neo-colonial and neoliberal elements of “a broader assemblage of national and international policy agendas that are being enacted in education systems around the world and in relation to the emergence of global fields of educational assessment and policy making.” When Indigenous education is reduced to policy measures such as NAPLAN and “closing the gap” and their narrow focus on literacy and numeracy, possibilities for shaping a shared educational space collapse and “the logic of colonial categorisation, control and domination remains” (Vass and Chalmers 2015, p. 148). Even when attempts to introduce Indigenous perspectives are made, when the framing of assessment and testing remains firmly entrenched in (neo)colonial interests the “changes do not engage with or interrupt the more traditional pedagogies, curriculum and assessment practices of schooling.” (Vass and Chalmers 2015, p. 149). Because it asserts an Indigenous authority to exercise a socially constructive agency of relationship with all neighboring powers in the natural and social ecology that constitutes Ngarrindjeri Ruwe-Ruwar – and which now includes colonial powers – a *Yannarumi* approach potentially decenters colonial interests to reposition the interests and knowledges of Indigenous peoples and the nation state in a shared space of interaction.

Decolonizing the Education System by Speaking as Country

The depth and texture of Indigenous knowledges, the intergenerational transmission of teaching and learning that has survived colonization, carries a creative potential missing in current education curriculum and overlooked in the overarching national school assessment and testing framework. Ngarrindjeri have a multigenerational history of being categorized and controlled, and their knowledge system has been devalued and erased by Australian systems of education. By contrast, a *Yannarumi* approach to curriculum development and assessment of education expects

pedagogical approaches that support and reproduce the wellbeing of Ngarrindjeri students and of Ngarrindjeri as a Nation. The sovereign act of *Yannarumi* supports a learning environment that respects Ngarrindjeri expertise and experience, and recognizes the impediments that the State has constructed in its problematic colonizing relationship with Ngarrindjeri since 1836. Since the early 1970s, Ngarrindjeri have engaged in a resistive and transformational educational program designed to produce the conditions for Ngarrindjeri self-determination and wellbeing based on Ngarrindjeri knowledges, experience, and philosophy (Hemming 1993; MacGill et al. 2012). Ngarrindjeri leaders have consistently asserted the right to speak and act as Country as fundamental to a peaceful, healthy, and just life in social relations that emphasize connection rather than division. Ngarrindjeri practices of engagement, rather than ruling out Indigenous-government partnerships, look for ways in which Indigenous and settler Australian ways of knowing can work together.

Attempts to transform the way Australian curriculum and assessment systems operate mandate that “consideration must be given to the complexity and disjuncture inherent . . . within formal learning engagements as a site where Indigenous and Western knowledge, forms of knowledge and ways of knowing are continually posited in opposition to one another” (Brown speaking in Lowe et al. 2014, p. 80). According to Vass and Chalmers (2015, p. 142), “One of the key challenges for education . . . is the creation of a *third cultural space*” which “recognises that Indigenous communities have distinct and deep cultural and world views – views that differ from those found in most Western education systems.” In part, this builds on Homi Bhabha’s (2004, p. 55) notion of the *third space* as a location where postcolonial cultures are acknowledged to interact and imbricate, and the colonial assignation of value or status can be questioned and challenged, reinterpreted, and transformed. Points of commonality and productive possibilities for collaboration can also arise in the space between cultures. While the notion of a “third space” can describe the coming together of disparate cultures to produce a new hybrid entity, it is crucial to understand how *Yannarumi* resists the tendency of the dominant culture to impose its values and normative character over the new cultural forms that emerge when societies come into creative contact. As an Indigenous praxis of cultural authority, *Yannarumi* articulates Indigenous values associated with an epistemology and ontology of interconnectivity that recognizes and respects the vital persistence of differences. *Yannarumi* asserts a continuing Indigenous agency of cultural being and of social construction, which cannot be subsumed within the dominant colonial culture that is predicated on the disarticulation of Indigenous voice and the denial of Indigenous presence. And in turn, while settler Australian discourses are questioned and challenged by Ngarrindjeri *Yannarumi*, their existence and continuation as such is not denied or negated. When Eurowestern and Indigenous systems are both valued and recognized to coexist and potentially bring mutual benefit through shared enrichment, the communication of their productively interconnecting differences opens potential for transforming teaching and learning away from hierarchies of control and toward education for wellbeing.

This reading of Bhabha’s concept of a “third space” supports an understanding of the decolonial space *Yannarumi* works towards, in which there is a coming

together and communicating among diverse knowledge traditions. A Ngarrindjeri nation building approach brings processes and practices of education to work towards the shaping of a *third space* by engaging the key elements of creation, Country, spirit, *Yannarumi*, relationships, and the interconnected wellbeing of life in natural and social ecosystems. Through the *Yannarumi* process of “enunciation” (Maldonado-Torres 2007) or “expression” (Bignall et al. 2016), *Ruwe-Ruwar* enters into the realm of intellectual production when Ngarrindjeri “speak as Country” and produce *thinking* that shifts colonial perspectives by demonstrating how Indigenous people occupy a *thinking space* connected to Country, which is itself an agent in knowledge formation. This “third space” enables a move away from colonial constructs of race that have been used to control, denigrate, and fail Indigenous peoples. *Yannarumi* enables the return of appropriated knowledges to their custodians, also fostering a general appreciation of Indigenous survival and transforming contemporary Australian colonialism. Through Ngarrindjeri *Yannarumi*, local Indigenous Country, knowledges, spirit, agency, and relationships engage partners in taking a “decolonial turn” (Maldonado-Torres 2007, p. 262) which departs from colonial categories of Indigenous containment and control and moves to create conditions for the emergence of a different type of relationship between Indigenous peoples and the settler State (Mignolo 2009, p. 15, see also Vass and Chalmers 2015).

Lowe (2014) proposes that the national Australian curriculum in its current form, with its (neo)colonial framing, is unable to work respectfully with Indigenous content. By contrast, Ngarrindjeri transformations in the political sphere demonstrate that a *Yannarumi* approach offers possibilities for transforming the curriculum into a “decolonial” (Mignolo 2009) or “excolonial” (Bignall 2014) form. A *Yannarumi* approach involves Ngarrindjeri “speaking as Country” to collaborate productively with the colonial nation state and so to realize the mutual benefits and bonds of trust that accrue from a just acknowledgment of responsibility for shared histories, together with a comprehensive recognition of the capacity for complex alliance between Indigenous and non-Indigenous knowledges and traditions. In the context of South Australian curriculum development, this requires not only the incorporation of Indigenous voices into the standing curriculum, but especially also the development of a new curriculum from the founding basis of *Yannarumi*, or Indigenous cultural agency in speaking as Country. In turn, this involves a shift away from the notion that Indigenous educators can be considered by Government simply as service providers who furnish cultural content that may be selectively adopted or ignored in the curriculum depending on the whims and preferences of the educational authority, to enabling Indigenous peoples as co-creators and authoritative agents who will help to decide the content that is needed to foster an appropriately nonimperial and culturally diverse curriculum.

Yannarumi and related Indigenous Nation-building practices open and expand possibilities to resist the “gap” focus, transforming the curriculum and the system of education as a whole, away from a determining logic of comparative hierarchy and uneven expertise, toward a transformative decoloniality. Discourses of “progress” towards an assumed universal cultural goal that defines and delimits the aspirations

of civil education do not remain unchallenged, but rather attempts are made to work in partnership toward defining new goals that reflect culturally diverse but allied experiences of social wellbeing. *Yannarumi* does not measure Indigenous peoples against non-Indigenous peoples. Indigenous success is not dependent on non-Indigenous failure. Rather, *Yannarumi* works toward an education for wellbeing whereby all living things are perceived as connected and relations can be managed for maximum mutual benefit. In recognizing that all things are connected, *Yannarumi* attempts to engage productively with the dominant settler-colonial reality in order to encourage its transformation, rather than simply opposing it. Ngarrindjeri people accordingly collaborate productively with the settler nation state to generate the education, training, and employment of Ngarrindjeri people, but this also enables Ngarrindjeri to develop resources to advance Ngarrindjeri interests and cultural ways of knowing and being in relation to Ngarrindjeri Country. A Ngarrindjeri assessment of relationality and interconnected benefit ensures that Indigenous education, training, and employment occurs in ways which are healthy for people, country, and all living things and support Ngarrindjeri self-determination in relation to neighboring powers and agencies.

A *Yannarumi* approach may also be brought to bear upon a critical analysis of the Australian national system of educational assessment and testing. *Yannarumi* emphasizes relational connectivity and the role of diversity in enriching environments and enhancing their potential for supporting complex associations that bring creative benefits through partnerships. Rather than perpetuating the deficit logic of current assessment and testing methods, a *Yannarumi* approach to assessment can generate alternative styles of education to supplement and expand current frameworks. Learning achievement and the successful acquisition of concepts need not only measure a student's performance in relation to a finite standard, but could also be evaluated on the basis of the student's capacity for understanding the complexity of how things relate in an ecology. This ecological understanding requires a critical aspect when students develop knowledge of the systemic constraints to interconnectivity (e.g., by understanding the rules of grammatical sentence construction and word linkage in a system of language) and a creative aspect based on experimentation coupled with reason, when students are called to conceive how interrelations between things (including people) can be directed to enable the wellbeing of individual entities and of the environment that sustains them.

Ngarrindjeri want knowledge to take form and expression through a deep acknowledgment of *Ruwe-Ruwar*: the aim of teaching and learning is then not to "target" and "train" students, but to respectfully and creatively weave connections. Viewed from an Indigenous Australian perspective, the art of weaving is a complex and sophisticated educational act. For Ngarrindjeri, weaving represents the concept of *Ruwe-Ruwar* (interconnectivity) and the spiritual connection through *Miwi*:

Ngurunderi taught us our *Miwi*, which is our inner spiritual connection to our lands, waters, each other and all living things, and which is passed down through our mothers since Creation. (Ngarrindjeri Nation 2007, p. 8)

Ngarrindjeri learning is developed culturally through doing, experiencing, and knowing through the *Miwi* (see Bell 1998, 2014). Truth is known through doing, feeling, and believing – when something makes sense it is felt as right, and this feeling produces insight, learning, and wisdom evidenced to others through later actions. This embodied concept of truth translates as *wurruwarrin*, and it expresses a notion of ecological balance or harmony.

Balance and harmony is also important in weaving. Cultural weaver Ngarrindjeri Elder Ellen Trevorrow explains: “Stitch by stitch, circle by circle, weaving is like the creation of life, all things are connected” (Ngarrindjeri Nation 2007, p. 51). Similarly, Trawlwoolway citizen and scholar Julie Gough (2006, pp. 12–13) describes how:

In the warp and weft of a basket I sense the durability and resilience of my people. What may be aged and dusty and empty to most, is for me a story of time well spent. When I see one of our ancestors’ baskets in a museum, I recognise people who had the skills and motivation to create what they needed and an understanding of how to live with economy and grace. A basket doesn’t just represent skill in an aesthetic sense, but the ability to construct an object to carry and hold a wide variety of goods. To take time to select a plant and prepare its fibre and weave its form requires a sense of belonging, a passion and provision for living. In weaving a basket women were making a future.

A *Yannarumi* approach to curriculum and the assessment of education opens possibilities for understanding the interconnected agencies of the “teachers” and the “learners,” to experience the weaving together of the various elements of knowledge that lead to better understanding of humanity in relationship with Country, or of the self in relation to the world. For all students who cohabit in the learning environment that is subtended by Ngarrindjeri Country, teaching and learning should connect and interweave with Ngarrindjeri knowledges, valuing the ecologies and economies, arts and sciences, histories and futures of Ngarrindjeri Country and Nation in balance with those of the settler society (see Bell 2008).

Conclusion

Ngarrindjeri *Yannarumi* is a declaration of Indigenous authority and constructive agency. While Ngarrindjeri *Yannarumi* relates to Ngarrindjeri *Ruwe-Ruwar* and is therefore particular to Ngarrindjeri Country, the spirit of *Yannarumi* is shared by many Indigenous nations in Australia and internationally (e.g., Cajete 2000; Watts 2013; Moreton-Robinson 2007, 2015; McCoy et al. 2016; O’Brien 2016). *Yannarumi* is an “intellectual, theoretical and imaginative space” like Kaupapa Maori:

Whereas we can conceive of space geographically and politically, it is important to claim those spaces that are still taken for granted as being possessed by the West. Such spaces are concerned with intellectual, theoretical, and imaginative spaces. One of these is a space called Kaupapa Maori. This concept has emerged from lessons learned through Te Kohanga Reo and Kura Kaupapa Māori and has been developed as a theory in action by Maori people. (Smith 2016, p. 156)

Paraphrasing Māori scholar Graham Smith, Linda Smith (2004, p. 154) has argued that the Maori framework of Kaupapa Māori “has provided important insights about transformation, about how transformation works and can be made to work for Indigenous communities.” Further, she quotes Pahima (2005), who explains, “Kaupapa Māori is a transformative power. To think and act in terms of Kaupapa Māori while experiencing colonisation is to resist dominance.” Kaupapa Māori is a response to a colonial system in which Indigenous “survival, our humanity, our world-view and language, our imagination and spirit, our very place in the world depends on our capacity to act for ourselves, to speak for ourselves, to engage in the world and the actions of our colonisers, to face them head on” (Smith 2016, p. 151).

Kaupapa Māori principles correspond closely with *Yannarumi* values, laws, and science/knowledge. Of particular value in Kaupapa Maori is its all-encompassing quality, its many layered aspects and multifaceted programs of which education is integral and which connect education with myriad other sectors and spheres. As Pihama et al. (2004, p. 10) explain “*Kaupapa Māori* cannot be seen to be bound to any one sector (for example education or justice) as *Kaupapa Māori* does not know the parameters that are a part of defining those sectors.” Those parameters are defined within western philosophies not *Kaupapa*. This principle corresponds exactly with the Ngarrindjeri notion of Ruwe-Ruwar as interconnection among people, land, waters, and all living things. Like Kaupapa Māori, Ngarrindjeri *Yannarumi* attempts to talk and act as Country across multiple sites of transformation. Sites which may be physical or conceptual, or both (as is the case in the “meeting of the waters”) are strategically chosen based on the potential to have an impact on the ideas produced. As Linda Tuhiwai Smith (2016, p. 154) has explained, “the Māori struggle for decolonisation is multilayered and multi-dimensional and has occurred across multiple sites simultaneously (see also Smith 2006, 2012).” The Ngarrindjeri struggle for decolonization shares this multilayered, multisited quality. Central among these is the site of education. Noting the central role of education in decolonization, Graham Smith insists “there is limited scope for the socio-economic re-development of Indigenous populations without a prior or simultaneous educational revolution” (Smith 2011, p. xiii; see also Smith 1990).

Drawing on Chandra Mohanty’s (1991) statement that “the world (is) transversed with intersecting lines,” Linda Tuhiwai Smith (2016, p. 155) notes that “Intersections can be conceptualized as lines that intersect or meet other lines and also as spaces that are created at the points where intersecting lines meet.” As with Māori struggles, making space within such sites is becoming a feature of Indigenous Australian work in education for transformation. Rather than occupying a marginal position, work at intersections takes Indigenous agents “into the spaces once regarded as the domain of the ‘settler’” (Smith 2016, pp. 155–156). Ngarrindjeri work at those “sites of intersection” where Indigenous and colonial histories and presence meet, calling for a respectful sharing of space where Indigenous peoples can be acknowledged to speak and act as Country. The Ngarrindjeri Regional Authority works to create:

complex alliances of ideas woven together from a Ngarrindjeri centre of consciousness. This weaving together of partnerships and knowledges represents Ngarrindjeri agency . . . and highlights the importance of Indigenous standpoint theory in securing and communicating Indigenous conceptualisations of country. (Hemming and Rigney 2016, p. 15; see Nakata 2007; Moreton-Robinson 2013)

The Ngarrindjeri vision takes shape through *Ruwe-Ruwar* which carries with it responsibility for the body of land waters people and all living things. *Yannarumi* acts to assert the ongoing presence and regenerate the shape of Ngarrindjeri *Ruwe-Ruwar*. The default shape of the settler-colonial nation state, however, is one in which Ngarrindjeri geographies are silenced. From the perspective of capitalist colonialism, lands and waters are mapped, assessed, and categorized; not in relation to life, spirit, and wellbeing, but in relation to “service benefit to human users” (Bignall et al. 2016, p. 460). In this framework of understanding and action, settler colonial peoples are overrepresented and First Peoples never fully present. Consequently, this chapter contends that if the nation state is truly committed to socially just education that values Indigenous peoples and knowledges, then a general transformation of teaching and learning is required. Ngarrindjeri *Yannarumi*, in association with the broader nation building and governance strategies currently practiced by the Ngarrindjeri nation, has been presented as a case study in educating for resistance and transformation. *Yannarumi* is a strategy that enables “the just mediation of diverse worlds” through “collaboration across and between cultural differences” (Bignall 2014, pp. 340–341). It is a key concept in a Ngarrindjeri philosophy of ecosystemic interconnectivity that emphasizes “positive forces of interaction in constructing and transforming communities” (Bignall 2014, p. 340). In resisting efforts to alienate, eliminate, and assimilate Indigenous peoples and knowledges, Ngarrindjeri *Yannarumi* provides an exemplary foundation from which to transform colonizing forces of teaching and learning into decolonizing approaches that are life sustaining for Indigenous peoples and Country.

Abstract

Indigenous education initiatives within the academy have always performed revolutionary work in clearing spaces for thinking at cross sections between disciplines. Perhaps none of these is more challenging than the conversation

O. R. Mercier (✉)
Te Kawa a Māui (School of Māori Studies), Victoria University of Wellington, Wellington,
New Zealand
e-mail: ocean.mercier@vuw.ac.nz

e-mail: brleonard@alaska.edu

between Indigenous ways of knowing and Western science. For 10 years now, a Victoria University of Wellington, New Zealand, and University of Alaska, USA, university course on Indigenous knowledge(s) and science has given us and our students a shared space within which to consider, discuss, and analyze some of the most difficult and pressing issues at this interface. The course is co-taught by a Māori and a Dene'/Athabaskan scholar and draws Māori, Alaska Native and non-Indigenous students and their interests into conversation, using online forum discussion, videoconferencing, and skype. This chapter surveys Indigenous knowledges and science in the context of this course. We describe the course, its background, review the issues discussed, and describe the learning outcomes for students. Finally, we discuss the future direction of the conversation and its potential impact on global issues, such as climate change and biotechnology.

Anchorage, Alaska, and Wellington, Aotearoa, are separated by 7000 miles as the godwit flies, as well as distinct political, cultural, and educational orientations and practices. But for global scholars – academics and students alike – who focus on knowledges embedded in place, the usual comparisons with Western “facts-only” science can be confrontational. Looking to other local knowledges in other places becomes an affirmative way to put knowledges into context. While book knowledge about other locals can go some way to answering our questions, for Indigenous peoples, a *kanoki kitea* (face to face) approach is more authentic and more closely represents the relational aspects of knowledge, especially for peoples whose oral traditions are relatively recent. Fortunately, in a technology-connected and ever-shrinking twenty-first-century world, the question that a distance of 7000 miles poses is not whether it *can* be bridged, but *how* to bridge it and for *what* outcomes.

The virtual student exchange that we discuss here, going for 11 years and counting, has provided an authentic, safe, shared space for Indigenous and non-Indigenous students to explore, learn about, critique, and share their local knowledges. Indigenous knowledge has continued relevance in a changing world, particularly one that is underpinned by an ethos of Western science, and students explore for themselves how to recognize and articulate its importance.

In this chapter, we lead in to the debates around the conflicts and convergences between Indigenous knowledge (IK) and science, with a brief history of science in the Aotearoa New Zealand school education system. We then introduce ourselves and discuss, in “engagement” terms, how Beth and I work together on these issues. We describe how we have designed and shaped a shared virtual classroom space to bring students into the conversation. Then we move to discuss how we foster student relationships, through carefully chosen readings and different learning activities. Student feedback reveals what learners take into and from this shared space. Our final section then describes and discusses contemporary issues at the IK-science interface. Student contributions to these debates can perform emancipatory work for themselves, their families, and their communities. That these emerge from an Alaska-Aotearoa interface gives strength and validity to a multi-traditions approach.

Science in the School Curriculum – The Case of New Zealand

In the New Zealand education context (as with many other places with colonized Indigenous populations), the mission of government-funded Native schools – instituted in 1867 after the Mission schools system folded – was to “Europeanize” and “civilize” Natives (see Simon and Smith 2001; Barrington 2008; Penetito 2010); arguably to overwrite the identity of the Māori pupil with a colonial ontology and epistemology. Barrington records that in 1883, Te Aute, a boarding school for Māori boys, was teaching mathematics, higher algebra, elementary science, elementary physics, and geography and that students were achieving to a standard equivalent to a European school. By 1890, several pupils per year were matriculating to the University of New Zealand. This achievement would gradually be supplanted by a prevailing view that Māori boys and girls should be trained in manual and practical skills, including housework (Barrington 2008, p. 145).

While education of Māori in New Zealand has historically been patterned by a civilizing agenda, Māori language, history, and knowledges has survived through various means, and these sites of resistance continue today, most notably in the *kōhanga reo* (early childhood “language nests”) and *kura kaupapa* (primary schools) which teach curriculum in *te reo Māori*. Barrington’s discussion on the history of Native Schools education points out that as early as 1923, Māori activity such as *kapa haka* and *poi* (action dance traditionally used in relation to battle) was included in Native schools by local initiation. In 1909, the syllabus for the mainstream schools of the time was transferred to Native schools, and this included arithmetic and nature study. An emphasis on learning agricultural and horticultural skills reflected national priorities but upset some Māori parents – their children already knew and were practicing these skills in their home lives (Barrington 2008, p. 107). Government-mandated curriculum from the 1930s instructed Native Schools to include Māori subject matter – myths, history, *kapa haka*, weaving, and other practices. Although teachers’ application of this policy was uneven, an array of oral narratives reveal instances of Māori science being included in these lessons, such as making kits and mats from lacebark and *harakeke* (flax), and the treatment of *karaka* berries

(Simon and Smith 2001, pp. 174–176). More recent examples of Indigenous knowledge in the science curriculum include *hangi* (earth oven) and *kowhaiwhai* (geometric patterns). However, several reasons have been noted as problematizing these approaches, such as taking of IK out of its cultural context, limited teacher knowledge, and *whakamā* (embarrassment) that can be invoked in the Māori student who is expected to be an expert in forms of knowledge they may no longer have links to (McKinley and Stewart 2012).

Putaiiao (science), the science curriculum document in te reo Māori was published in 1993, with a *karakia* (prayer, incantation) at the front, acknowledgement of a Māori worldview, and graphic design elements that evoke mātauranga Māori. However, this has not been unproblematically received (see McKinley and Keegan 2008; Stewart 2017) due to concerns about where to apply limited human and financial resources, and English being seen as the international language of science. Quoting Noam Chomsky, Penetito points out how difficult non-assimilation into a majority culture can be (Penetito 2010, pp. 65–66). But Simon and Smith argue that this “structured interface” (Simon and Smith 2001, p. 3) in fact contributed significantly to the shape of Pakeha-Māori relations, and New Zealand educational practices (if not the shape of science education). The fallout of these “organised collisions” (Simon and Smith 2001, p. 3) in science requires an independent and safe cultural space within which students can discuss these issues.

Indigenous Knowledge(s) and Science

In a discussion that explores the Indigenous knowledge (IK) and Western science (WS) interface within education (see Stewart 2010), it is important to start with some definitions. However, while there is some general agreement around what is “Indigenous knowledge” (IK) most prefer to describe rather than prescribe. The more wordy but nuanced descriptors, such as Indigenous Knowledge Systems (IKS), Indigenous Ways of Knowing (IWK), and Indigenous Ways of Living with Nature (IWLN) (Aikenhead and Ogawa 2007), convey that IK is not a “thing” in the sense of a body of knowledge but active, complex, living and dynamic, and embedded in people and place. Specific IKSs, described in their local language, such as mātauranga Māori (Māori knowledge / mātau: to know and ranga: the product of that knowing), convey this dynamism more naturally, as the very grammatical structure of many Indigenous languages emphasize the verb, or active and sometimes connective element, rather than the object or subject (Peat 2002).

There is probably not the same level of general agreement as to what constitutes “science.” It could be a body of knowledge (Oxford English Dictionary) or a way of thinking (Sagan 1997). For some, it is a philosophy underpinned by such things as inductive and deductive reasoning. To others, it is a method that includes an hypothesis, an experiment, generation of data, and the production of a theory. And so far, Indigenous science would fulfill all of these criteria (see Hikuroa 2016). However, WS would also see science as always subject to challenge and falsification. It will always be limited to what can be empirically

observed, that is, it can only deal with what can we “measure, quantify and otherwise weigh in the balances” (Huxley 1958). Furthermore, modern science claims itself to be universally applicable, and thus it objects to being labelled “Western science.” This of course denies the unique cultural and political contributions to the development of modern science. A universal idea of science also denies the potential of pluralistic pathways to knowing, or as Angayuqaq Kawagley puts it, science’s “plurality of origins” (Kawagley 2006). Who gets to decide what is or isn’t science? Why does it seem to matter how other knowledge systems measure up against WS?

These questions reveal a set of implicit assumptions in the Western academy. These can provoke unidentifiable anxieties in those (especially) with other ways of seeing the world. However, the academy rarely presents opportunity to address these underlying assumptions and confront the disquiet. Therefore, what university undergraduates and postgraduates grapple with during our course “Indigenous Knowledge(s) and Science in Global Contexts” can seem paradigm shifting and profoundly unseating. The curriculum content has had to be considered, condensed, and presented carefully. We are not simply teaching students and engaging them in debates at a neutral interface between Indigenous and Western knowledge systems. We are sometimes dealing with casualties of science, for whom science – whether the discipline itself or the institution – is emotionally charged. We are also doing decolonizing work, challenging and deconstructing students’ beliefs in the intellectual superiority of science, and reconstructing according to more democratic and emancipatory aims. Additionally we are providing space for learning, relearning, and in some cases revitalization of Indigenous knowledges. This affirms our students’ epistemological identities as well as our own.

Comparisons between WS and IK usually do disservice to IK, often because WS is taken as the benchmark against which (a) the ontology (b) the epistemology, and (c) the utility of IK are all called into question. For instance, the question, *Is IK a science?* might invite three types of response: a view that Indigenous peoples had no science; a view that there is no such thing as Indigenous science (i.e., science is Western); and a view that “Indigenous Knowledge is not and never has been Science, because it’s superior to what is essentially an enterprise of political domination” (The Tapestry Institute 2017).

The similarly WS-centric question *Is IK useful to science?* represents the viewpoint that Indigenous knowledge is useful and may in fact be critical to advancing our knowledge as a society, particularly in an era of resource vulnerability and planetary instability. In this space, IK is vulnerable to being exoticized and/or mined. Removal of the knowledge from its broader context can lead to the knowledge losing its meaning, becoming “universalized,” and indeed, colonized. Much of the literature classified as “Traditional Ecological Knowledge” falls into this category (McGregor 2000), as TEK studies poorly handled nonmeasurable aspects. IK is holistic and science can only accept knowledge of a natural, empirical, and physical nature, so WS processes can strip IK of what makes it uniquely Indigenous. “Mauri [life-force, energy] is also understood as the binding force between the physical and spiritual aspects of entities within the ecosystem” (Morgan 2009). In a Māori way of

thinking, something presumably detrimental happens to the *mauri*, or essence, if the spiritual and physical elements of IK are separated.

The question *Does IK contain science?* asks what elements of IK are similar to WS. This question can be reframed by thinking about an interface between ways of knowing (Durie 2005b). What are the similarities and differences between Western and Indigenous ways of knowing? These have been discussed and presented using different models such as Venn diagram intersections (Roberts 1996; Barnhardt 2007), in which an area of overlap between WS and IK denotes “common ground” and converging streams (Barnhardt and Kawagley 2005). Another suggestion (Mercier 2007) pays attention to science as a knowledge producing practice. The 2D model disentangles “science” from “Western” and “knowledge” from “Indigenous” in the debate. Georgina Stewart’s (2007) superset model is a variation of the Venn diagram, with two circles, but the one represented by WS is completely enclosed by that represented by IK. It suggests that WS as a philosophy does nothing that the broad system that is *mātauranga Māori* does not or cannot, resonating with points made above. Western Science is a subset of IK, but IK also includes methodological relativism and holistic analysis (Hikuroa 2009). Others suggest that the two systems are not compatible at all due to political processes of colonialism and imperialism. “Like colonization, the Indigenous Knowledge enterprise seems to have everything and nothing to do with us” (Nakata 2002, p. 282).

Once we have made students aware of contrasting definitions of IK and Western sciences, we try to move the discourse to one that encourages a transformative approach, illustrating “older” versus “newer” definitions of sciences. Older definitions for example include: value free, objective, neutral, abstract; independent of spaces, places, gender, social, and economic constraints. “Newer” characterizations, where IK and science may converge or negotiate parallel paths include: active, sentient, sacred, spiritual, powerful, culturally bound, socially and linguistically inflected, place-based, entwined with politics and policy, shaped by gender, social, and economic contexts (Hikuroa 2009; Medin and Bang 2014; Peat 2002).

Since 2007, we have used our Faculty positions in our respective universities to explore just this: how science can be understood as a large organic entity with disparate converging parts in a state of transformation. We have involved students by collaborating on a low-Carbon emission exchange, using videoconferencing and online forum discussion that engage Indigenous and non-Indigenous students. We affirm and use Indigenous pedagogies within our academic institutions and combine these with exploration and use of enabling technologies for educating people in place.

Our aims are not solely the advancement of knowledge: we are also interested in transformative pedagogies and outcomes for what continue to be marginalized groups. We describe how we have brought Māori, Alaskan, Alaska Native, and non-Indigenous students together from across a number of differences: undergraduate and graduate students, different universities from different nations, hemispheres, and continents. We discuss to what extent Indigenous aspirations and contributions to a global conversation are advanced by such an initiative.

Engaging as Indigenous People with Questions About the Other

On another level, it felt great to be able to drop the ‘academic western hat’ and to just engage outside of ‘research’ and to engage as indigenous people with questions about the other. (Jamie-Lyn Winiata, 2009, personal communication)

The term “Other” is loaded with imperial connotations. In our context, however, as reflected in the above quote, the “Others” are our Indigenous classmates from across the Pacific. This flips the usual discourse on its head: with two “Others” central to the discourse, critiquing the place of Western ontologies in our disciplines, the colonial gaze is turned back upon itself. By using “other” for our friends across the water, we prioritize that relationship. While we cannot fully ignore the colonial “Other,” we can localize it and reclaim some space for ourselves.

In what follows, we first describe the “Science and Indigenous knowledge course” developed at Victoria University of Wellington (VUW). Literature that explains the course’s positioning is reviewed. Descriptions of class activities further expand how this literature provides tools for students in the ongoing struggle for the legitimacy of Indigenous knowledges in the academy. We then discuss the “glocalizing” pedagogy developed to frame a discussion around literature written by Indigenous peoples. We then explore how we “prepare” and then engage with the “Indigenous other” with a brief description of how the exchange came to be. We then describe how we have revised and reorganized the exchange structure and content over the last decade, in response to working together, our observations of student engagement, and solicited and unsolicited student feedback. We share student responses to the exchange. Finally, we share some of the thinking and work that students do that demonstrate how their learning contributes to current research and engages pressing global issues.

Preparing Ourselves for Engagement

What we decide to include and exclude from the course is determined by who we are and how the two of us engage with each other. Ocean grew up in an English-speaking home. She went to Victoria University of Wellington (VUW) straight after school, to major in physics and maths, completing a PhD in physics in 2002. She then learnt te reo Māori through Te Kawa a Māui (TKAM) at VUW while concurrently teaching physics and a course at TKAM called “Māori science.” Her teaching and research interest in knowledge systems comes from her ongoing attempts to reconcile her training in Western science with her mātauranga. Beth is Dene’/Athabascan (and also grew up in an English-speaking home) in Shageluk, Alaska with minimal exposure to her Native language Deg Xinag. She began studying Deg Xinag as an adult, working with family members while earning a BA in linguistics, then enrolled in an MEd program in language and literacy to further her knowledge of Indigenous language revitalization. She is the fourth Alaska Native to earn a PhD from the University of Alaska Fairbanks (UAF).

Her research and teaching is in Indigenous education and language revitalization/repatriation. A continually expanding conversation between the two Indigenous authors is at the heart of this review.

MAOR317: Special Topic (Science and Indigenous Knowledge) was a Victoria University of Wellington Māori Studies course, devised and introduced to Te Kawa a Māui/School of Māori Studies in 2007. It introduced students to narratives and literatures on or related to Indigenous Knowledge (IK). Definitions have been suggested for IK (see for example Semali and Kincheloe 1999) generally proffered with caveats regarding whether IK can (or should) be defined (Battiste and Henderson 2000). The UNESCO description has wide general influence, and suggests that

Indigenous knowledge is the local knowledge that is unique to a culture or society. Other names for it include: 'local knowledge', 'folk knowledge', 'people's knowledge', 'traditional wisdom' or 'traditional science'. This knowledge is passed from generation to generation, usually by word of mouth and cultural rituals, and has been the basis for agriculture, food preparation, health care, education, conservation and the wide range of other activities that sustain societies in many parts of the world. (UNESCO 2003)

They add that IKs share certain characteristics. IKs are specific to an area, and have a local boundedness. IKs are culture- and context-specific. IKs are largely nonformal knowledge, are orally transmitted, and generally not documented. IKs are not static, but dynamic and adaptive. IKs are holistic in nature and are closely related to survival and so-called subsistence for many people worldwide (UNESCO 2003).

The UNESCO Local and Indigenous Knowledge Systems (LIKS) program have produced a set of colored posters (UNESCO 2008) that highlight some of the key features of Indigenous knowledges, using case studies and photographs. These are good group discussion prompts at the beginning of the course, giving students an appreciation of how Indigenous knowledges are holistic, tied to local places, oral and thus relational, gendered, adaptive, cumulative, etc. Students also discuss how their own (Māori) knowledges fit these descriptions.

Some IKs are thousands of years older than Greek philosophy, where the roots of Western scientific thinking lie. Some argue IK is a more mature and embedded science than that which emerged from the Enlightenment (Cajete 2000). IK and/or TEK is still used in many parts of the world to maintain human survival and living in relation to the environment. Other scholars explore the epistemology of the Pre-Socratic and Pythagorean Archaic and Classical Greek eras, underscoring a past Western orientation that paralleled Indigenous worldviews. Western epistemology (and resulting science methodology) then diverged towards its current "fragmented, materialistic, and dualistic worldview" (Rahm 2014). Battiste and Henderson (2000) describe IK as an "expression of vibrant relationships between the people, their ecosystems, and the other living beings and spirits that share their land" (Battiste and Henderson 2000, p. 41). Battiste further highlights the place-based orientation, that is, "Indigenous knowledge is also inherently tied to land, not to land in general but to particular landscapes, landforms, and biomes where ceremonies are properly held, stories properly recited, medicines properly gathered, and transfers of knowledge properly authenticated" (Battiste 2002, p. 13).

Helpful for the course is Turnbull's description of science as a local set of practices that produce tried, tested, and reliable knowledge. All sciences, "Western science" included, are local knowledge systems (Turnbull 1997). In this course, students can learn and unlearn the "geographical" boundaries that separate local knowledge systems. Recognizing that some cultural borders are easier to negotiate than others, can help students make sense of any historic difficulties they've had with entering the "alien culture" of the science classroom (Aikenhead and Jegede 1999). Western science in particular has been heavily critiqued for claiming itself to be bias-free when its practices and institutions are saturated with gendered values (Harding 1998; Gaston 2015) and cultural values (Medin and Bang 2014).

As mentioned MAOR317 has also presented students with the challenge of exploring the interface between "Indigenous" and "Western" knowledge and science. Discussions at intersections are relational. Durie points out that certain values must be adhered to if interactions at the interface are to be beneficial to both parties. The interaction may arise because a common goal is identified, with neither knowledge system alone able to contribute all the skills required to accomplish the aim. Interaction must be done with a shared understanding of each knowledge system's heritage, working commonalities in knowledge systems, and common values or rules of engagement (see Durie 2005a). The rules of engagement can be achieved through a "negotiated space" (Hudson et al. 2010; Smith et al. 2008).

One of the sobering realities of designing and teaching a University, lecture-based course labelled "Indigenous Knowledge" is that we are often learning about IK from sources that have taken it out of context. While many of the students in the class are Māori, and thus have their own knowledges to refer to, how do we learn more about "our" own Indigenous knowledges, and furthermore others', when the knowledge is filtered through text written in English? Furthermore, how do we avoid appropriating IKs in ways Anthropology might be accused of (Nakata 2007)? Can we go a step further and compare our knowledges to "theirs"? We come with a spirit of humility and desire to learn – in light of the academy's vampiric predilection for knowledge, is that enough? In planning an approach to learning about, but also analyzing ours and other Indigenous knowledges, it helped to use a "glo-c-alizing" approach.

The early part of [MAOR302] is concerned with generalizing or 'globalising' some of the common features of Indigenous oral histories and Traditional Ecological Knowledge. Near the end of the course, students embark on their own 'local knowledge project', and in doing so 'localize' (or re-'localize') those 'global' frameworks to their own contexts. This 'glo-c-alizing' approach can then be understood as one that seeks commonalities from a global community it assumes membership of, and guidance from that global network of wisdom, in order to effect positive local change. The 'glocalising' approach aims to synthesize the global (in all of its diversity of contexts) from a specific local perspective, primarily for the purpose of local, not global understanding. As the word 'glocal' retains the 'local', a 'glocal understanding' overtly retains the local perspective from whence the 'globalizing' (or generalizing) has come. Glocalisation then, may be an approach that, knows its limits and lays no claims to universalities or 'globalisms', respects local variations and counter-narratives, and allows for unique interpretations for each student and classroom. For instance, a glocal framework for IK in one context's classroom will be different to that devised for another. (Mercier 2011, pp. 300–301)

A glocalizing approach is not a universalizing approach that claims to know all Indigenous contexts because it knows one. Nonetheless, it is an enriched understanding for having looked globally, beyond one's own context. A "glocal" look is more than local, but it does not lay claim to tyrannous universalisms; within the term itself the "local" observer is named and acknowledged.

In a previous publication (Mercier 2011), Ocean described an exercise in which we examine seven different published creation narratives as told by Indigenous nations of different parts of the world. The students read and analyze these, looking for similar markers of Indigenous values and philosophies, approached with a "glocal" lens. That is to say, they are not attempting to take the impossible "objective" standpoint, but recognize their own, or neighboring beliefs in the story of Paoa, a Ngāti Porou folk hero. What students get from this comparison of different local IK systems is a sense of the ways in which Indigenous knowledges relate to creation and as a way to then reapply those glocalizations to better understand local cases. This reading provides a sense of commonality, connection and solidarity with other Indigenous peoples, through their stories. An obvious shortcoming of the exercise is that it does not connect with people, and when local knowledge is oftentimes embedded in people, then it may be the relational, person to person, aspect of knowledge transmission that is most valuable from a Native perspective (Simpson 2004).

But however it is obtained, any sense of kinship and solidarity is fortifying when IK holders and keepers suffer attacks on the integrity and validity of their knowledge systems. At VUW, oral histories relating mātauranga Māori (Māori knowledge) understandings of tectonic activity and their historic impact on the landscape were dismissed by Faculty as "just myths and legends." Earth systems science Hikuroa can relate to this, briefly referencing his student experiences (Hikuroa 2009), including a prevailing ideology that "Māori had no science" (see Dickison 1994). As a response to this kind of casual epistemicide (see Grosfoguel 2012), Ocean unpacks the term "myth" with students – encouraging them to use instead "oral history." She points out one of the more pervasive "myths" of Western science: that time flows at a constant rate. Newton's assertion may describe our everyday experience of the world, but it is inadequate in describing higher order functioning of the super-ubiquitous quantum particles that is the stuff from which we are made.

Overall, this teaching exercise is designed to point out the irony of a system that labels IK and other knowledge systems myth and yet is silent on the perpetuation of 17th century Newtonian half-truths in the public mind. We must all acknowledge that we believe in myths, skeptic or not, and resist the indulgence of our mean-spirited urges to debunk other ways of knowing. (Mercier 2011, p. 302)

The MAOR317 course was designed in response to Ocean's visits to North America in 2005 and 2006. She was privileged there to partake of the discourse occurring at the University of Alaska Fairbanks, and the University of Saskatchewan (Mitchell et al. 2008), regarding how Indigenous knowledges could be integrated into science teaching contexts. Ocean continued the conversation through her courses at VUW.

But it was important to retain a connection with people Ocean had met in North America and to extend these relationships to students. This motivated Ocean to approach Beth at University of Alaska Fairbanks to see whether some form of exchange might be possible.

Preparing the Space for Exchange and Engagement

VUW's videoconferencing facility is housed in a windowless underground room, a limitation in the Indigenous exchange architecture that was vividly illustrated for us in 2010, when at the end of our discussions Leonard turned the camera to the windows of their room at University Park. The snow was gently falling outside in Alaska, a sight that caused Aotearoa students to gasp with wonder: a highly uncommon sight in Wellington and a real contrast to the lengthening days and warm sunshine of our spring time! (Leonard and Mercier 2014, p. 228)

The simple, yet profound, sight of snow falling outside of our virtually extended classroom condenses what for us is at the heart of the exchange – we come together with a variety of different experiences and knowledge, past and present, yet share a common goal, and actively and continuously negotiate the limitations of our space in order to share. Over the last 10 years, we have progressively opened up more space and time from our academies for our students to discuss Indigenous issues. The expansion has enabled a less constrained conversation, that both satisfies our institutions' goals of producing graduates who are global citizens but simultaneously challenges current media and information technology systems and support.

Our first exchanges brought students of "Science and IK" together with different courses at UAF (Leonard and Mercier 2014). These included "Documenting Indigenous knowledge" and "Communication in Cross-Cultural Classrooms." Our courses had overlapping themes, but up until 2014, their overall aims were different.

Since 2014, our exchanges have been collaborations between UAF and VUW courses both under the title "Science and Indigenous Knowledge(s) in Global Contexts" (Leonard and Mercier 2016). These courses contained similar but not identical reading lists and had similar course learning objectives. Crucially, our students shared as much classroom time as our only partially overlapping semester times would allow. At between 6 and 8 "joint" videoconference sessions, this meant shared classroom time for around half of the semester teaching time. Figure 1 illustrates the overlap in the courses in 2017.

Beth's addition in 2014 of a special topic graduate course CCS693 "Indigenous Knowledge[s] and Science in Global Contexts" to the University of Alaska Fairbanks schedule was developed with Ocean as part of her Fulbright research and teaching scholarship, spent in Wellington, Aotearoa New Zealand. Graduate students in this course came from cross-cultural studies, education, restorative justice, and natural resources management backgrounds. The course description is below:

University of Alaska Anchorage (UAA) Schedule			
Week	Date	AKNS490 Theme	
1	Jan 23	Review of Indigenous Knowledges	
2	Jan 30	Review of Indigenous Knowledges	
3	Feb 6	Values and the Sciences	
4	Feb 13	Values and the Sciences	
5	Feb 20	Ways of Knowing, Being, Doing & Becoming	
6	Feb 27	Ways of Knowing, Being, Doing & Becoming	
7	Mar 6	Ways of Knowing, Being, Doing & Becoming	
		VUW-UAA Joint Session 3:30-5pm (NZDT)	
		Spring Break University of Alaska Anchorage	
8	Mar 20	Implications for Education	Victoria University of Wellington (VUW) Schedule
		VUW-UAA Joint Session 2:30-5pm (NZDT)	MAOR302 Theme
9	Mar 27	Implications for Education	Indigenous knowledges
		VUW-UAA Joint Session 2:30-5pm (NZDT)	
10	Apr 3	Implications for Education	Biotechnology: a case of wasps
		VUW-UAA Joint Session 1:30-4:15pm (NZST)	
11	Apr 10	Contemporary Research Issues	Indigenous Philosophy
		VUW-UAA Joint Session 1:30-4:15pm (NZST)	
12	Apr 17	Contemporary Research Issues	WS and IK Interface
13	Apr 24	Contemporary Research Issues	'Schooling' (and) the 'brown body'
14	May 1	Contemporary Research Issues	Indigenous People and Biotechnology
		VUW-UAA Joint Session 1:30-4:15pm (NZST)	
		Mid-trimester break Victoria University of Wellington	
		Traditional Ecological Knowledge	Traditional Ecological Knowledge
		Traditional Ecological Knowledge	Traditional Ecological Knowledge
		Native Science	Native Science
		Indigenous science education	Indigenous science education
		Space, time, language	Space, time, language
		Indigenous Science Film Festival	Indigenous Science Film Festival

Fig. 1 In 2017, MAOR302 met 1:10–5 pm every Tuesday, beginning March 7, and AKNS490 met 5:30–8:15 pm each Monday, beginning January 23. The schedule above, given to students, shows the “joint session” times our class times coincide, and during which we videoconference and have small group breakout discussions using Skype or Canvas

Fig. 2 UAA recognizes the diversity of our unique location in Southcentral Alaska, the ancestral homelands of the Dena'ina Athabaskan, Ahtna Athabaskan, Alutiiq/Sugpiaq and Eyak peoples (<https://catalog.uaa.alaska.edu/aboutuniversity/>)

This course will provide students a critical framework for examining Science (as a Western or Indigenous construct) and Indigenous Knowledge[s] (IK or IKS) paradigms. As a holistic paradigm, it is difficult to compartmentalize and separate aspects of IK into Western academic categories. Students will explore the ideologies underlying Science and Indigenous Knowledge[s] including how aspects of each paradigm converge, diverge, or negotiate parallel paths. In addition, students will survey the methodologies of each, including how paradigms are constructed, deconstructed and reconstructed through the influence and engagement of Indigenous peoples.

The new title and description reframed the MAOR302 course slightly, to reflect the “global context” of our courses. Beth also introduced a wealth of new critical literature, including what has become a key text in our courses (Medin and Bang 2014).

In Beth's new position since 2016 as faculty in the Department of Alaska Native Studies (AKNS), University of Alaska Anchorage (UAA) (Fig. 2), she has further revised the course for on-site senior-level undergraduates. Most students are enrolled in the AKNS or Alaska Native Business Management minor programs, with majors ranging from anthropology, philosophy, education, social work, the natural sciences, and business. The UAA course – “IK and the Sciences in Global Contexts” – has been recently approved as a permanent course in the Alaska Native Studies minor program.

As described in our previous publications, Alaska's Indigenous context is richly diverse, with over six major cultural groups and 20 Native languages recently

recognized as official languages by the State of Alaska, as illustrated in Fig. 3. Like UAF, UAA is situated on Indigenous lands of the Dena'ina peoples, with *Tikatnu* ("Cook Inlet" – a shared legacy between Aotearoa and Alaska) being recognized as one of the Dena'ina names for the Anchorage area (see Fig. 4).

By contrast with Alaska, Aotearoa New Zealand's native language, te reo Māori, is spoken across all iwi, but with relatively subtle dialectal differences. Aotearoa New Zealand also retains strong vestiges of Captain James Cook in place names around the country, including its tallest mountain, Aoraki/Mt. Cook, which in 1998 had its Kai Tahu (the main *iwi* in the South Island – see Fig. 5) name restored as an official name.

However, Wellington Harbour was not so welcoming to Cook, who in 1773 was unable to make headway into the harbor against a prevailing wind. The oldest surviving name for the capital city's harbor is te Whanganui a Tara, recognizing Tara, a voyager and explorer whose descendants Ngai Tara were the first people to settle the harbor, about 800 years ago. The area also carries the name Te Ūpoko o te Ika a Māui, meaning the head of the fish of Māui, Māui being the folk hero and demigod who fished the North Island out of the ocean. Victoria University of Wellington's Māori name, adopted in 1994, is te Whare Wānanga o te Ūpoko o te Ika a Māui. The main campus, which has grown around the Hunter Building of the original Victoria College, is situated in a place that used to be known as Pukehinau, or the hill where Hinau trees grow (see Fig. 6). Hinau is a berry-bearing tree that grows to about 60 ft. and was used a food source for Māori. There is just one Hinau on campus and it is vanishingly present in the suburb. By contrast with University of Alaska Fairbanks (Leonard and Mercier 2016), no mention of the name Pukehinau is found on the VUW website.

Overall this initiative connects to efforts to indigenize the academy (Miheua and Wilson 2004) and decolonize the disciplines (Nakata 2007), but it is uniquely led by two Indigenous scholars in different hemispheres, connected by a long-lasting relationship, drawing mutual strength into their local contexts.

Turning Space into Place

Beth's courses run on Instructure Canvas (previously Moodle) and she provides VUW students with a login so that Canvas becomes their digital home for the VUW-UA exchange. In 2010, Ocean hosted using Blackboard. The Moodle and Canvas platforms were preferred as Blackboard required a lengthy permissions process to enroll participants from outside VUW. In a dedicated Introductions area, each student shares a photo, something about their upbringing, where they are from, their study and research interests, and hopes for the exchange. Students often choose and share a greeting from their local area.

For the online forum discussions, we mix students into groups and assign each a digital room on the Forum. Groups are asked to discuss and respond to between two and four questions. Students can read other groups' posts but cannot contribute; however, this can vary from year to year. Students contribute a set number (at least 2)

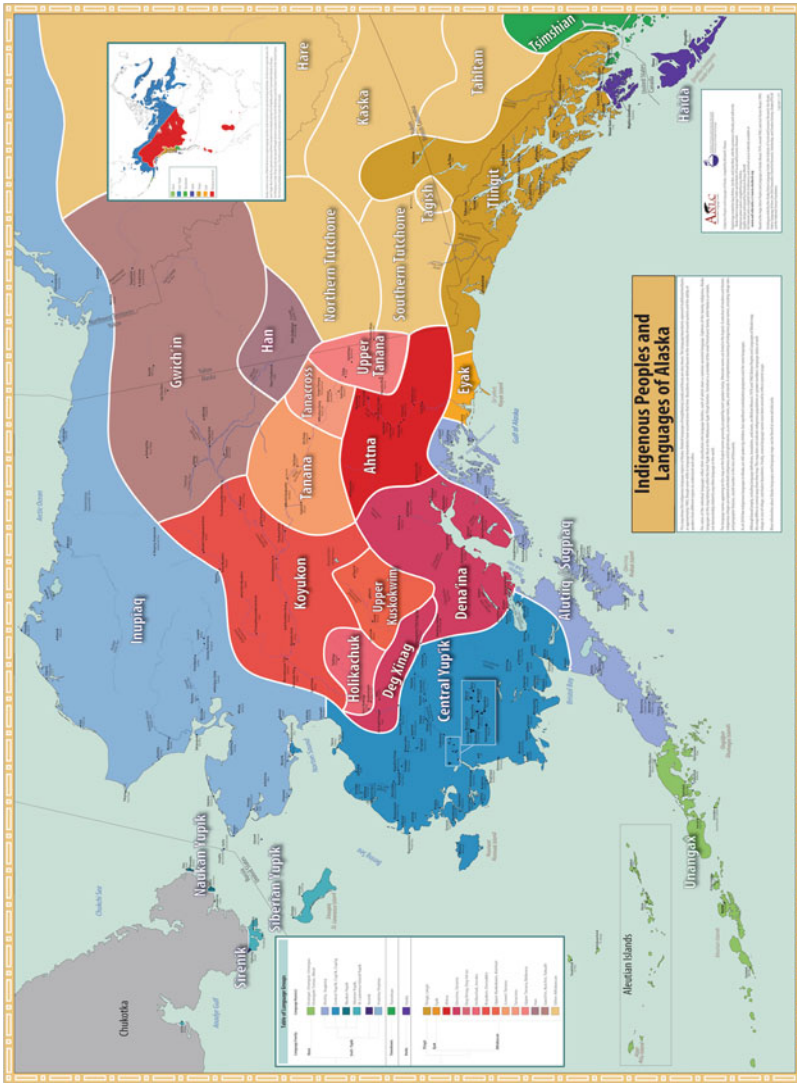

Fig. 3 Alaska languages map (Krauss et al. 2011)

Fig. 4 Focus on the Dena'ina area of the Alaska indigenous languages map (Krauss et al. 2011)

of posts. To encourage discussion, a due date is given for a first post, and a second due date for subsequent posts.

The second forum has a new set of questions, and sometimes a regrouping of students. In their posts, students draw from readings and lecture material, their own experience, and ask their own questions. From student feedback, we have found that the videoconferencing and Skype function in “breaking the ice” and make the online text-based Moodle forum “less foreign and unknown” (Leonard and Mercier 2014). Ocean’s videoconference with Alaska is in the second half of the VUW students’ first lecture. For the first lecture, this (see Fig. 1) provides just enough time to inform and prime students about the forthcoming encounter, have them prepare and practice a quick verbal introduction, and to brainstorm their impressions of Alaska for the icebreaker.

Exchanging and Engaging

In addition to the literature already mentioned, course activities include engagement with Indigenous science in the form of video presentations and readings, and guest presentations by Indigenous scholars whose work crosses traditional disciplinary boundaries. For the University of Alaska students, discussion of Dan Hikuroa’s (2009) presentation “Integrating Indigenous Knowledge with Science” takes place early in the semester to familiarize students with discourses surrounding IK and science. Students are aware of issues surrounding status and power differentials between IKs and WS; however, Hikuroa’s approach assists students in working through this often “contentious, adversarial” relationship in understanding the

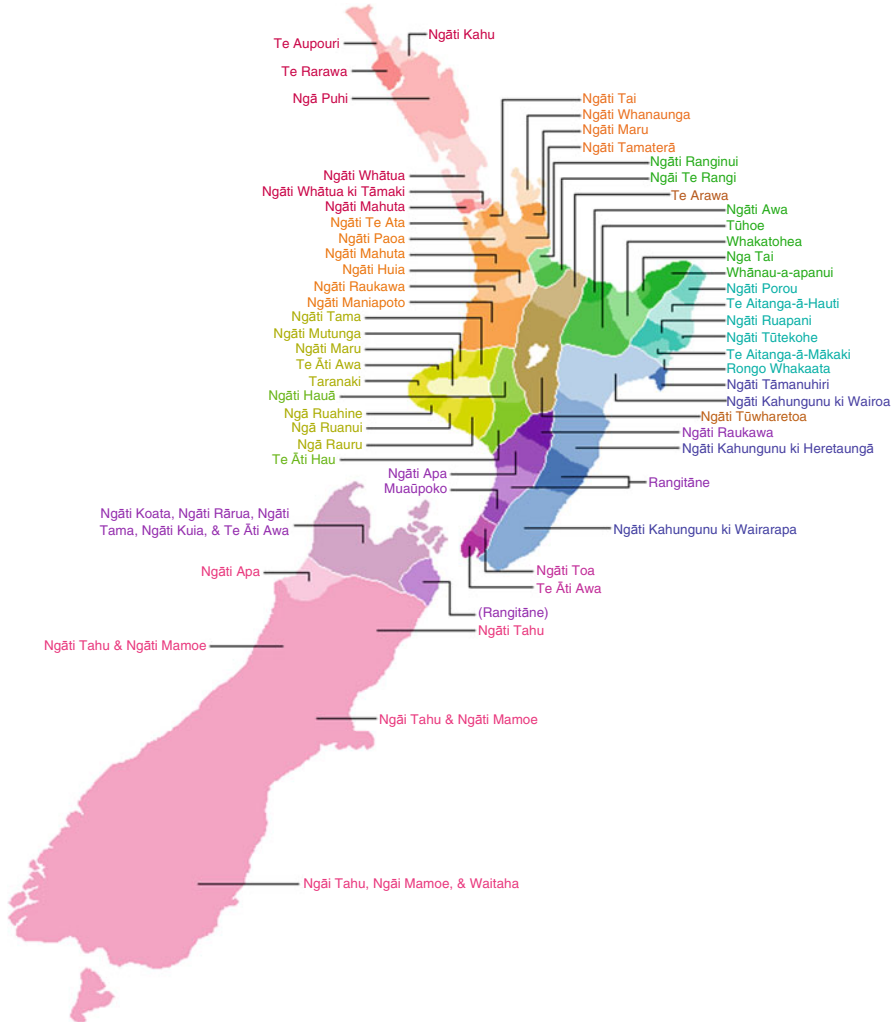

Fig. 5 Iwi (Tribal) Map of Aotearoa (Wikimedia Commons 2014)

potential for bringing these diverse paradigms together. His presentation of Kepa Morgan’s (Morgan 2004) applied model with attention to how health of the land is assessed by measuring *mauri* gives students a concrete example of how IK functions in contemporary contexts. At the end of his presentation, Hikuroa reiterates Stewart’s (2007) notion that Western science is actually a subset of Indigenous science, adding that Western methods often constrain complete understandings of complex relationships.

In 2017, University of Alaska students began engaging with IK through learning about the Aotearoa context, after viewing an episode of TV series Project Mātauranga, “Tātai Arorongi: Revitalising Māori astronomy” (Douglas 2013). Scholars featured in

Fig. 6 Excerpt of 1915 map, “Wellington and Environs,” which has been annotated with Māori place names by anthropologist Elsdon Best. “Victoria College” (at the intersection of Salamanca Road and Kelburn Parade) occupies an area Best has identified in capital letters as “Pukehinau”

this video, such as Rangī Matamua, Hoturoa Kerr, and Pauline Harris, link similar elements in Māori and Western astronomy through a trans-disciplinary examination of cosmology, genealogy, spirituality, and navigation. Māori astronomy resonates with Alaska Native sciences on a number of levels, including association of ancestors and creators with spirits of celestial bodies; for example, the Milky Way galaxy is described in the Dene’ Koyukon language as *Yuhtseeyh Yo Tel Oyh Hu*, “where your grandfather (Raven) snowshoed over the sky” (Jetté and Jones 2000, p. 637).

Through discussions and in-class exercises, students are encouraged to explore how IK and WS paradigms converge, diverge, or negotiate parallel paths. “Western Science, Native Science and Science Education” (Medin and Bang 2014) has proven to be a key source for organizing discussions around worldviews, diversity, and the “framing of research questions” in the sciences (2014, p. 60). During joint course activities, a chat forum allows students to share concepts and discourses within their own research or study areas, using examples provided by Medin & Bang around guiding metaphors, power relations, privilege, constraints, and psychological distance (2014, pp. 60–65).

Beth and Ocean also assign readings from physicist David Peat’s (2002) “Black-foot Physics.” Keeping with the course description, Peat discusses ways in which IK and Western Science might converge, or negotiate parallel paths including Dubois’ [sic] concept of “The God Within” – a powerful spirit of place that “molds, shapes, influences and transforms” beings who occupy these spaces (2002, p. 107). Peat also presents David Bohm’s notion of the “larger enfolded order” (2002, p. 77) in which the whole is enfolded within each part (2002, p. 6) saying that “Bohm rejected the idea of a reality composed of objects in interaction in favor of processes and activities in a continuous movement of unfolding and enfolding...this reality is not confined to matter but extends to thoughts, feelings, and emotions unfolding within the brain and body” (Peat 2002, p. 237).

These ontologies align on many levels with Native American and Alaska Native Ways of Knowing including the power of thought, air, and breath. Beth shares portions of her research on Deg Xit'an narratives and linguistics with students, highlighting epistemologies and ontologies that allow "other" processes of creation, sentience beyond the human realm, and validation of oral traditions as authentic systems of knowledge. For example, anthropologist Witherspoon proposes that the Navajo have established cultural categories or hierarchies that classify the world based on "potential for motion" (Witherspoon 1977, p. 140) and acknowledge "air as the source of all knowledge and animation" (1977, p. 53). In a similar vein, the late Dene'/Athabaskan Chief Peter John states that "in Athabaskan culture you have to be very careful because words have *power*. The white people do not understand the Athabaskan way with words" (Krupa 1996, p. 60). Tohono O'odham scholar Ofelia Zepeda illustrates the processes of oral traditions as:

"Throwing words into the air" – this is what the O'odham say about talking, storytelling, praying, singing – all of which make up the genre of oral tradition. The words are thrown into the air in the form of spoken word, song, oration or invocation. . . But everyday words, like the words that are meant to have power, also are embedded with their own strength. This is the reason why so many believe in the power of words and why the speakers must be careful and responsible for what they speak. (Zepeda 1995, p. 5)

Beth challenges students to think broadly about the sciences, beyond strictly STEM (Science, Technology, Engineering and Mathematics) approaches. With the goal of including the concepts and processes of "social" in the science realms, she assigns Choctaw scholar Karina Walter's video "Why do the research on unspoken issues." (Walter 2009) Walter connects Indigenous knowledges and science on a number of levels, engaging "stories of origin" and "original instructions" in addressing community challenges. In a similar approach to Medin & Bang, and Peat, Walters seeks to reorient scientific questions and methods, with a goal of "returning research to the sacred."

Publications by the late Yup'ik scholar Kawagley also provide key sources for discussion and analysis around ecology and relationships. In "Education Indigenous to place: Western science meets Native reality," Kawagley and Barnhardt (1998) provide an example relevant to the Alaskan context, highlighting the knowledge of the late Dene' Chief Peter John. Western scientists, each with his or her own specialty, were present in Chief John's village to discuss the decline of the pike; however, Chief John was able to more accurately analyze causal factors and outcomes using a holistic knowledge of place combined with Indigenous science methodologies developed over thousands of years.

Instructor lectures and guest presentations have extended our exploration of the sciences – modeling collaborative, praxis-based approaches to research in Indigenous contexts. Ongoing research by the UAF Master's students and PhD candidates enriched the discussions on a number of intersecting levels, with students utilizing counter-narrative, Indigenist, decolonizing, and/or unsettling methodologies to refute and re-orient science myths through re-writing and re-righting scientific truths from Indigenous perspectives (Peat 2002; Smith 2012).

In 2016, we were honored to host Ojibwe scholar and course text author Megan Bang for a guest lecture – “Community based design research: Indigenous peoples and science education” – during which she discussed her work with communities in Chicago, Seattle, and Wisconsin with a focus on effective teaching of “both Western and Indigenous science.”

In 2016, we were also very pleased to have Māori neuroscientist Melanie Cheung for a lecture on “Maori Science, the brain and neuroplasticity,” wherein she examined the challenges of scientific methods that incorporate “sacredness, livingness and soul.” Cheung discussed community defined protocols and ethics and defines Māori Science as “empirical, methodical, abstract, and extends to include ethics, community and spirituality.”

Synchronous connections with Indigenous scholars via videoconference effectively *glocalise* (Mercier 2011) required readings for both the instructors and students, providing unique opportunities to engage with scholars around questions and issues not directly referenced in the texts.

Reflecting on the Exchange

Students are excited about sharing a virtual classroom with students overseas. In the years where Beth’s students have been graduates, the Aotearoa undergraduate students have expressed nervousness about engaging, on account of feeling less knowledgeable. The graduate students and their proposed research set scholarly examples for the 300-level students.

In addition to honoring ancestors, ancestral knowledge, and place, our key rule of engagement is “respect.” In fact we expected nothing less than an attitude of respect as seen in our instruction handout: “In your postings to the forums, we *know* [emphasis added] that you will all observe the number one guideline: respect” (Leonard and Mercier 2014, p. 231).

Students on the whole relate respectfully to each other. One or two exceptions were identified and dealt with quickly, and further emphasized the need for safe spaces in Indigenous studies. In these classes, challenges of creating and shaping safe spaces often comes in the form of “defending Western science against reverse discrimination” (see Leonard and Mercier 2014, p. 232). In some cases, students are struggling with their own identities (as Indigenous, non-Native, or Pākeha), histories, processes of power, privilege, and disruption of the dominant narrative around science. These challenges may manifest in attempts to minimize the knowledge of other students for example. We have quickly responded to these disruptions of safe space using direct or indirect methods, depending on the nature of the offense. In one case, a formal apology was required and forwarded to the student and instructor. In other cases, we respond privately to students. Maintenance of safe spaces within the course is not an attempt to limit “free speech,” rather provide an opportunity to engage forum questions, readings, video presentations, and class discussions utilizing Indigenous concepts of respect.

When students explain their local situation to students in a different country, this both informs the “other” and turns students into expert commentators on their local contexts. This affirms students’ own funds of knowledge, encouraging them to speak out and boosting their confidence, which enhances further exchanges.

As an icebreaker, for the last 2 years we have asked students to brainstorm and share their perceptions of the other country. These have often lead to quite amusing stereotypes of the other, and the opportunity to work through national cultural differences. A string of reality TV shows – Ice Road Truckers, Yukon Men, The Alaskans – serve up powerful and lingering impressions of Alaska to the Aotearoa students. On the other side, the haka and the “man-bun” were noted by Alaskan students as Māori things they associated with New Zealand. Aotearoa students were less aware of the term “caribou,” than they were of reindeer. The direct exchange between Alaskan and New Zealand peoples gave checks and balances against stereotypes and misunderstandings. Our shared classroom became a space in which translation, explanation, and demystifications were expected, anticipated, and dealt with using humor. A light touch was needed initially for the shared virtual space to become a safe place within which to reflect upon and continue “indigenous struggles within the colonial project.” And to do so with support from another place besides our own colonial infrastructures and institutions.

Kinship and solidarity between Indigenous peoples became an emerging theme of feedback gathered from students about the course:

I believed that we were the only people who were having concerns about our people, our traditions & our environment. The similarities are so close that the indigenous ties were almost instantaneous. Instead of the isolation that we experience in Aotearoa it is exciting to know our indigenous brothers & sisters are available for us & we are available for them (MAOR317 Student personal communication, 2014)

The class really helped me to understand more fully how my experience as an Indigenous person is similar to my brothers and sisters in Aotearoa (CCS 693 Student personal communication, 2014)

This solidarity had positive impacts on student learning. “I was given the opportunity to discuss & establish connections with a great group of people. The presentations were great. The forums were insightful the discussions humbled me. I am grateful to everyone for what I have learnt.” MAOR317 Student personal communication, 2014. This particular student attributes their learning to “everyone” – suggesting that it was through forum discussions and reading presentations that literature became embodied, alive, and relevant to them.

As mentioned, the literature speaks to key questions relating to the validity of knowledge, ideologies underlying Indigenous knowledge and science. In effect, the journey of this course, through literature and through joint discussion, was nicely brought together by this student: “we need to get to a point where we can view all science as a discourse, not as objective truth” (personal communication, 2014). Other students found that course content exposed a gap in the foundations of their learning, and that their epistemological understanding of the world was shaken. This

had a profoundly unseating effect on one particular student: which connects with other research on the gaps in our secondary school education, particularly related to history, see Manning (2011) and te Huia (2016).

Affinity with the multi-modal learning environment was another theme of the feedback, with one student declaring MAOR317: “Seriously, BEST Paper at Uni!” (MAOR317 student personal communication, 2014). The 4-h class was noted as a possible deterrent for some, although one student fed back that they “Loved the 4 h format, it worked really well” (MAOR317 Student personal communication, 2014).

University of Alaska classes are set up as a 2.5–3 h seminar block beginning in late afternoon to accommodate those with 8–5 pm work schedules. Due to the distance nature of the Fairbanks courses, evaluations have been harder to elicit from students; however, the few that have been returned, along with verbal commentary, indicate students’ satisfaction and engagement: “The three hour joint videoconference did encourage me to engage and to lead. The forum was set up to encourage us to participate. . .this was an excellent class and one that should be continued” (P Hyslop, personal communication, 2014). Another student commented that the course allowed her to participate in international (and synchronous) discussions, as the demands of travel were not possible at the time for her and her family (O Skinner, personal communication, 2014).

MAOR302 continues to have a good attendance rate, with 100% attendance at the final class for 2 years running, by contrast with other classes Ocean teaches. Many lectures have had 100 + % attendance, through the visits of interested postgraduate students and visiting Faculty.

Contemporary Issues at the Science Interface

Students engage with much critical literature in the course, and naturally apply these to their own situations, with knowledge exchange within the classroom canvassing students from a broad range of disciplines. The videoconferencing, Skype, and forum discussions also allow them to hear how these critiques, theories, and frameworks apply in cases in Alaska.

For the last 3 years, MAOR302 students have had further opportunity to connect with and contribute to active research projects occurring at the interface between WS and IK. This section describes some of this activity.

Digital Cultural Mapping

MAOR302’s first major piece of assessment is a “cultural mapping project.” This work connects into a school-wide initiative called the Te Kawa a Māui Atlas project. The project idea came from Cultural Atlas work at University of Alaska Fairbanks (Alaska Native Knowledge Network 2005). Since 2010, we have introduced digital mapping activity and assignments across several of our courses. The aim is to engage students, by involving them in a high-impact practice (Kuh 2008), diversifying their

learning experience, connecting with place, connecting with the disciplinary turns in spatial history and digital humanities, and exploring the plethora of ways that mapping is relevant to Māori studies (Mercier and Rata 2016; Mercier et al. 2013). Digital cultural mapping also explores how a critical pedagogy of place (Gruenewald 2003) might look, in practice.

In one such assignment, students contribute to a class-wide Google Earth map. In 2014 Ocean asked students to find two examples of projects or research which explore an “interface” between science and Indigenous knowledge. In 2015 students were tasked with finding two examples of “Māori and Indigenous collaborations.” They wrote a short narrative about each project and located and pasted these inside description boxes in Google Earth. The presentation back to students of their work combined gave them an appreciation of how global these initiatives are, even if the cases found were naturally biased toward Aotearoa New Zealand examples. The exercise enabled students to “specialize” in two particular cases, then glocalize their learning by peer-to-peer sharing. Spatial organization of the information meant that stories were visually pinned to a particular place, reinforcing a glocal “look.”

Conservation and Biodiversity – Pingao and Taputini

In 2014, Lincoln University ecologist Dr Hannah Buckley led a project that brought together conservationists, biologists, weavers, and community with an interest or connection to pingao, the golden sand sedge. Pingao is a sand binder, produces a stable dune, and is important habitat for native creatures, such as the katipō spider. It has always been highly sought after by weavers for its bright yellow color, ease of harvest, and minimal preparation required of the leaves, which are of a convenient width for tukutuku weaving projects. But pingao populations have been threatened by building on foreshores, trampling by stock, grazing by rabbits, and other introduced species, such as marram grass. As a contribution to the project, students in MAOR302 had a short field trip learning about pingao from Greater Wellington Regional Council staff. They surveyed and produced a Google Earth map of pingao at Lyall Bay. They also wrote a short treatise on pingao, inspecting and collating knowledge from various written sources, with different disciplinary foci, e.g., oral history, genetics, plant biology, and conservation.

Students have also explored how to plan crops for a māra kai, or traditional Māori garden. This is a project initiated by archaeologists Peter Addis and Dr Bruce McFadgen, assisted by administrator Terese McLeod. McLeod sourced two species of pre-European grown kumara – taputini and hutihuti – and these were planted alongside the gourd. The short growing season in the first year of planting did not suit the hutihuti. However, the taputini grew, was boiled, eaten, and relished. Although the students were doing their project outside of the growing and harvesting season, they nonetheless seized the opportunity to explore local resilience through the planning for placement of crops for a māra kai. These were based upon traditional principles, but some students blended these with other growing philosophies, such as companion planting and biodynamics.

Biotechnology

The Aotearoa New Zealand National Science Challenges are public and government-determined areas of research priority (see <https://www.sciencelearn.org.nz/resources/1112-new-zealand-s-national-science-challenges>). One of the eleven strands, “Our Biological Heritage,” funds a number of research projects concerned with protecting and enhancing Aotearoa’s biodiversity, through better management of “pests,” amongst other things. One such project is Novel Biotechnological Controls of Pest Wasps, and it brings together existing New Zealand research on four biotechnological controls – including gene silencing and the use of pathogen-bearing mites – of German and Common wasps. A new strand of the project research is led by Ocean and explores “social and cultural” perceptions of these biotechnologies.

In 2016 and 2017, Ocean involved students in this conversation. They are first tasked with reflecting upon, writing about and mapping the locations of a personal experience with wasps. The mapped points are aggregated and shown back to the class. In the second part of the assignment, students choose, consider, and submit a case for or against the novel biotechnology of their choice. Literature that is relevant for this discussion goes back to previous debates in Aotearoa about genetic modification of food and use of human tissue in research (Hudson et al. 2010; Cheung et al. 2007). Thus, frameworks for decision-making from a Māori perspective (Mead 2003; Hutchings 2004) debates on biocolonialism (see, for instance, Mead and Ratuva 2007; Pugh and Silver 2003), the appropriation of gendered images to soften contentious science (Cronin and Hutchings 2012), as well as discussions on biopiracy (Harry 2001), all need reconsideration in this new debate. Interestingly, students overwhelmingly choose to advocate for a biotechnology, rather than advocate against. Furthermore, they are situating the discussion in a context in which concepts such as *tino rangatiratanga* (sovereignty), the *mana* (inherent worth) of *taonga* (treasured) species, and *kaitiakitanga* (guardianship) are taken for granted.

Indigenous Science Film Festival

“The Indigenous Science Film Festival” is scheduled to coincide with MAOR302’s final lecture. Students are tasked with finding, presenting and analyzing a short film that they see presents issues related to Indigenous science. Students email the name, year, and country of origin of their film to Ocean, who groups the films into a “festival program.”

Students tend to select films that resonate with their own interests, so the program, illustrated in Fig. 7, was well populated with films in other Indigenous languages, featured traditional practices, and oral histories conveyed in song. Interestingly, at least five of the eleven programmed films were explicitly about biodiversity and climate change, reflecting the concerns of students to global issues, their impact on Indigenous peoples, and the potential of Indigenous ways of knowing to ameliorate against global warming’s impacts.

Conclusion and Future Directions

As this chapter shows, educational institutions can be places that perform emancipatory work: in freeing and enabling the decolonizing of the minds of our students and validating of personal and local knowledges. In Indigenous and Native studies, one way we do this is by calling out colonialism in its many forms. The courses described here are concerned with dismantling the hegemonic power of the Western scientific discourse. By thinking of Western science as another local knowledge system, with which we can choose to engage, and do so on our terms, Western science becomes another mechanism that can provide complementary tools for issues of concern (such as management of wasps). This opens up safe space for the exploration of our own Indigenous knowledges and ways of knowing. But it also invites us to work alongside “modern science” to produce knowledge in revolutionary and new ways, such as (perhaps) the “stretchy science” that has arisen in Aotearoa New Zealand’s discourse around science for the public good (see <http://www.confer.co.nz/crazyandambitious/>).

Our 11 years of experience at mounting virtual, international exchanges leads us to agree with Durie (2005b) that interaction across knowledge spaces needs to occur with certain things in mind, including anticipation of mutual benefit and knowledge

sharing in an environment of respect. Furthermore, as we work toward some common goals, we must be mindful of historical contexts and our place *in* place.

As we have shown here, tertiary classrooms can be reconstructed to connect disparate disciplines, geographically separated people, and different ways of knowing. This means it can model for other “negotiated spaces” (Smith et al. 2008) such as research projects in which connections between science and mātauranga are a key driver (such as in National Science Challenge projects). Our tertiary teaching spaces acknowledge Indigenous history in place, can be experimental, a nursery of new concepts and ideas, and pedagogically revolutionary. Importantly, relationships are at the center of our engagement between Alaska and Aotearoa. We open space for mutually beneficial interaction, different ways of knowing, and producing knowledge to be affirmed and expressed in a multitude of ways. In this way, the space becomes a respectful one that honors multiple traditions.

Student thinking and discussion on global climate change is a reminder that big problems need his kind of multi-directional input, and a greater recognition of ancient wisdom. When Naomi Klein traced the plunder of our planet’s resources and subsequent ruin of ecosystems to capitalism (Klein 2015), she recognized that Indigenous views of Earth – being relational and not proprietary, local and not global, sacred and natural – need to be adopted if we are to slow, halt, and reverse the inexorable grind toward a dying Earth. The granting in 2017 of legal personhood to Aotearoa New Zealand’s Whanganui River, and the Ganga and Yamuna rivers in India shortly thereafter, suggest that an Indigenous view of the river can sit companionably with Western legal frameworks. General concession is that this fundamental and potentially game-changing shift is rooted in Indigenous philosophies, reminding us how needful are our ways of knowing and being when it comes to valuing our natural environments. Conversations and courses such as our cross-Pacific collaboration give room for and vitality to Indigenous knowledges and pedagogies, promote discourse at the interface between ways of knowing our world, and practice and model how we grapple with big issues. These spaces will continue to be critical as we face an uncertain future and global change.

Abstract

This chapter explores education through the development of Māori visual arts in Aotearoa New Zealand, in particular, the contribution of key twentieth-century artists to changes in customary art forms through their work in schools and tertiary institutions often in collaboration with tribal communities. A key role such artists played was in promulgating Māori culture as integral to art education in New Zealand the impact of which over time has led to some revolutionary innovations in traditional art forms. To illustrate the dynamic

changes, the chapter focuses on one such innovation in art form, that of tukutuku or lattice work, both within the traditional context of marae settings representing communal projects and more recently by Māori graduates of tertiary-based indigenous visual arts programs exhibiting in community and mainstream gallery settings.

Keywords

Māori visual arts · tukutuku lattice-work · Māori art education · Indigenous visual arts education · Innovations in customary indigenous art

Introduction

There's a difference between ideas and action. Marae are where the action is; where it is happening; where people live. The only community that is organised for this type of creative work at the moment is the marae. The school is the other place where it could happen. I don't mind which way we start so long as we start. . . . The school is right in the middle of the community. It should be contributing a lot more than from 9am to 3pm. . . . (Para Matchitt in Dept of Ed, 1978, p. 296)

Writing in 1940 Māori statesman and esteemed tribal elder Sir Apirana Ngata predicted there would be evolutionary stylistic changes to traditional carving of the Māori and that “*the time may come when new designs will be evolved according to the vision of individual craftsmen*” (Davis 1976). As art specialist Frank Davis commented some 35 years later, little did Ngata know just how diverse such changes in Māori art and design across the board would be and within such a short period of time. This chapter focusses on one such art form – tukutuku or lattice work which were customarily located within the tribal meeting house setting. In the latter half of the twentieth century, key artists have contributed to periods of evolutionary change particularly through their work in schools, in tertiary institutions often in collaboration with tribal communities. Art educators too have played their role in supporting Māori artists and communities in promulgating Māori culture as integral to art education in New Zealand. Indeed, the reference by Matchitt links to the importance of the school as a site for creative work such as tukutuku. The impact of such changes has seen some revolutionary innovation in art forms such as tukutuku both within the traditional context of marae representing communal projects and more recently by individual Māori artists exhibiting in mainstream gallery settings.

This chapter explores how key Māori artists have contributed to the development of tukutuku as an art form through educational and communal projects. Evolutionary changes to process, medium, technique, and context are identified within a chronology of change based on hereditary and acquired leadership. For the most part, European contact has seen a rise in acquired leadership associated with the innovative transformation of tukutuku fostered by Māori prophets, Māori parliamentarians, Māori artists, and educators.

Background: Māori Art in Education

The impact of European colonization throughout the nineteenth century and beyond saw systematic devastation of Māori communities through colonial wars, massive land loss, and population decline resulting from introduced diseases. By the early years of the twentieth century, the survival of Māori people, their language, and culture were in crisis (Walker 2001). Ngata considered the building and embellishments of tribal meeting houses as one strategy to ameliorate the decline of Māori culture through the arts and as a means of revitalizing Māori communities. As part of this strategy, a formal education in the arts of Māori was realized in 1926 when Ngata established the School of Māori Arts and Crafts at Rotorua (Walker 2004).

Native schools had been established under the Native Schools Act in 1867, and in 1880 the Native School Code was enacted as part of the government's assimilation policy whereby Māori language was banned within school precincts and enforced through corporal punishment; a policy that remained extant well into the mid-years of the twentieth century. Schooling was conceived as an agent for "civilizing" Māori (Simon and Tuhiwai Smith 2001); thus, Māori beliefs and practices were discouraged and replaced by European beliefs and customs. By the 1930s, a utilitarian curriculum of practical arts of woodwork and home-craft was introduced and a socially engineered curriculum was instituted for Māori learners whereby Māori boys were trained as farmers and Māori girls as the wives of Māori farmers. The education regulations for Native Schools from 1880 to 1915 provided the earliest insights into visual arts education for Māori children that imposed a Eurocentric notion of the arts as utility.

By the 1950s and 1960s, and inspired in part by Ngata's successful arts revitalization program of tribal meeting houses through the previous decades, Māori arts and crafts were considered an important inclusion in the education of Māori children. Among Government schemes was that initiated by Clarence Beeby, Director of Education, who appointed Gordon Tovey in 1946 as the first national advisor in arts and crafts to set up the Art and Crafts Specialist Service for the Department of Education (Henderson 1988). His aim was to launch an ambitious Māori advisory art project for schools by convening a team of Māori artists who were trained as teachers and art advisors in schools. Between 1946 and 1961, 14 Māori art advisors were handpicked by Tovey. Many of these artists became leaders of the renaissance in Māori visual arts including Ralph Hotere, Katarina Mataira, Arnold Wilson, Para Matchitt, Sandy Adsett, and Cliff Whiting to name a few.

Cliff Whiting, Sandy Adsett, and Para Matchitt, in particular, established substantial reputations for their individual art and as a major force in art projects involving the community. Whiting drew on the work of master carver Pine Taiapa, the leader of the Rotorua Carving school by using community art as a focus for community revitalization (Department of Education 1978, p. 284). Whiting considered the marae

... the proper place for Māori arts and crafts. On the marae the people gather and share their thoughts through speeches, haka and action songs, singing and art. There on the marae

the significance of Māori art is made apparent. There a whole network of significance is sewn together by social relationships and art can make the tie manifest. (Department of Education 1978, p. 284)

Like Whiting, Paratene Matchitt influenced Māori art as an artist and teacher including teaching in the tertiary sector. His 1975 seminal work, the Kimiora Mural at Turangawaewae marae, was groundbreaking in its production for a number of reasons. The Kimiora Hall is not a meeting house but a marae facility that functions for social events. Besides Matchitt 12 other advisors from around the country were seconded to assist in the project. Local primary and secondary school pupils and teachers were invited to attend and contribute. Funding for the project was a combined effort of the Minister of Māori Affairs, the Turangawaewae marae committee, and the Department of Education (1978, p. 291).

The educational experiences generated by Whiting and Matchitt and others through community projects provided extraordinary opportunities for innovation in Māori art drawn from customary practices such as the art of tukutuku. However, a contributing factor to Māori art innovation in the latter years of the twentieth century was the emergence of Māori visual art programs in the tertiary sector some 40 years after the Rotorua Māori arts and Crafts School was established. These contemporary schools of Māori visual art encouraged radical and innovative expressions of art based on distinct communities of practice, Māori centered pedagogy, and new technologies.

Led by Sandy Adsett at Toimairangi at Te Wānanga o Aotearoa in Hastings, Steve Gibbs, and Derek Ladelli at Toihoukura at Eastern Institute of Technology in Gisborne, and Robert Jahnke at Toi Oho Ki Āpiti at Massey University in Palmerston North, each artist developed communities of practice defined by a shared interest in, and commitment to, Māori visual arts and culture. As inspirational teachers, their ability to remain innovative in terms of pedagogy and program design is due in part to a degree of autonomy they enjoy within the bounds of institutional structures. Being under Māori direction and control has enabled a distinctly Māori approach to the provision of Māori visual art practice to emerge. In contrast with other fine arts programs in mainstream, in the Māori art schools priorities are given to courses that have as their core focus Māori art history, language, and culture rather than art history and culture rooted in Europe. This is not to say that Māori visual art programs do not reference western artists or art history; of course they do. It is that Māori culture, and to an ever increasing degree the Pacific, is prioritized in order to ensure relevant practice and maximum engagement of students.

Such priorities are associated with an important assumption that underpins these programs; that Māori students achieve when they see themselves reflected in the curriculum and the environment. According to Adsett (2014, personal communication) in order to appreciate art, the students have to see themselves in the art. On these terms, student/staff engagement includes an approach to Māori ways of knowing that has seen the emergence of a distinct pedagogy based on the principle of kaupapa Māori incorporating wānanga (knowledge gatherings), hui (gathering), moteatea (ancient song), and karakia (incantation) on the one hand and public exhibitions at local, national, and international levels on the other. The imperatives

associated with such pedagogy require an enabling environment upheld by such principles as *manaakitanga* and *whakawhanaungatanga*. In other words, what is shared (*manaakitanga*) and what brings the students and lecturer's together (*whakawhanaungatanga*) is a level of participation characterized by mutual recognition and enabling engagement. Staff generally hold high expectations of students to achieve a high quality and standard of excellence which in turn challenges staff to ensure their own art practice remains current and up for public scrutiny.

This attitude is manifest, for example, in the expectation that students will exhibit their works in public venues alongside senior Māori and indigenous artists, including their lecturers and mentors. In terms of quality and excellence, there is an expectation that the integrity of expression and form are resolved in the student's art work to be exhibited because they are putting themselves on the line publicly. The incentive for students to achieve success is thus a temporal process in a real situation and with their mentors "... a matter of sustaining enough mutual engagement in pursuing an enterprise together to share some significant learning" (Wenger 1998, p. 86). An investment of practice in participation to this level is also a source of continuity in terms of succession planning and growing of new staff and new generations of teachers and artists. The programs mentioned here are staffed with former students, supporting Wenger's view that "... the history of the practice remains embodied in the generational relations that structure the community. The past, the present and the future live together. ..." (Wenger 1998, p. 90).

There is connectivity between each Māori visual art program and the aspirations of *whānau*, *hapu*, and *iwi* expressed in tribal development strategies. Thus, the importance of the wider community is actively promoted and practiced through student/staff involvement in local collaborations. This approach is underscored by the principle of reciprocity of "giving back" to their wider community. The *Toihoukura* and *Toimairangi* visual arts schools in particular are deeply linked to local *whānau*, *hapu*, and *iwi* through tribal affiliations and through community art practice.

Community Art Practice Through *Tukutuku*

It is possible to trace the development of *tukutuku* as an art form identifying changes to process, medium, technique, and context from the evolution of the art. As well, a chronology of *tukutuku* is offered by proposing a framework of change based on leadership and by extending on the work of Māori anthropologist Sir Peter Buck in the early twentieth century and contemporary Māori artist and university art educator, Kura Puke.

What Is *Tukutuku*?

Within customary tribal contexts *tukutuku*, *arapaki*, or *tuitui* were names used by different tribal groups for the traditional lattice work structure. For example, *tuitui* was used on the East coast of the North Island, while *arapaki* was in common usage

in the central North Island. Tukutuku is the most common term and therefore referred to as the generic term in this chapter.

The lattice work was comprised of a series of vertical strakes of kakaho (*Cortaderia splendens*) overlaid with horizontal wooded laths called kaho. Prepared native fiber including kiekie (*Freycinetia banksii*), pingao (*Ficinia spiralis*), or harakeke (native flax) bound the two sets of laths together generating a sequence of patterns in the process. The lattice structure meant that the patterns were rectilinear in configuration composed of single, cross, and overlapping cross-stitch. The overlapping cross-stitch was structural often appearing at the center and sides of the panels to maintain uniformity in the lattice structure, prior to the addition of pattern. As an art form within the meeting house, tukutuku evolved out of a wall thatching process and from the construction of traditional kites or manu tukutuku that have a similar lashing process. Within the interior of the meeting house, tukutuku were wall panels that appeared in between carved (or painted) house posts. Customarily the construction of the whare puni or chief's house was regulated by the system of tapu (a restrictive sanction). Consequently, during its early development, tukutuku was the prerogative of men. Women only participated in the art of tukutuku after introduced building systems allowed for the tukutuku panels to be inserted into the total house structure after they were completed thereby removing the panels from the house construction site where tapu sanctions were enforced (Taiapa 1953).

Although it is a three-dimensional art form, the rectilinear nature of tukutuku tends to exude a sense of two dimensionality. Over time patterns have evolved often related to the type of stitch used in the creation of the patterns. For example, waewae pakura (footprint of the swamp hen) utilizes a series of three alternating diagonal stitches or ties while patikitiki or patiki, commonly referred to as the flounder, has a deeper significance as the Coalsack constellation, which is a diamond pattern composed of cross-stitches. The cross-stitch is also viewed as the eyes of ancestors in concord with the notion of the deceased becoming stars expressed in the phrase of acknowledgment "kua wheturangitia." During the early development of tukutuku, there was a tendency to use a single pattern throughout the whole house. One of the most popular patterns in the late nineteenth century was the poutama (see Fig. 1). Poutama which features as the tukutuku pattern in Takitimu whareniui at Martinborough, Waiherehere in Whanganui, and Ruatēpupuke in Tokomaru Bay on the East Coast is a significant cultural pattern. This is because the pattern alludes to the progress one makes through life in terms of the obstacles and triumphs faced and overcome, as well as the journey of the Maori deity Tanenuiārangi in recovering the three baskets of knowledge. For Christians, the pattern became synonymous with the stairway to heaven. Within the context of the colonizing era, the popularity of the poutama becomes an appropriate metaphor for a people suffering depopulation, land alienation, and an imposed alien system of land tenure. Poutama thus signifies the trials and tribulations of people coping with a new world order with the ascending verticals of the pattern signifying the possibility of recovery. Patterns like kaokao (armpit) design relates to the haka posture, while others are patterns grounded in oral

 panels. (Image by Kitty
 Martin; courtesy of Hami Te
 Whaiti)

narratives associated with bringing the kumara to Aotearoa from Hawaiki the ancestral homeland of Maori. Beyond their cultural messages, tukutuku offers a rectilinear counterpoint to the curvilinear kowhaiwhai painted patterns on the rafters and fascia boards and the carved ancestral poupou (wall posts) flanking the tukutuku panels.

A Tukutuku Chronology

In 1921, Sir Peter Buck identified three periods of tukutuku development that he named early, post-European, and modern. Drawing on Buck's 1921 observations and Kura Puke's 2008 review, a five-stage chronology is proposed for the art of tukutuku. Puke's five phases of tukutuku innovation begins in the 1870s–1880s with the Ringatu period (1870s–1880s) followed by the Ngata period (1927–1937), Māori Modernism (1950–), Contemporary Māori Art I (1970), and Contemporary Māori Art II (2000–) periods.

Both Buck and Puke's names for the periods have been revised to reflect the major shifts in leadership that provided the impetus for changes in tukutuku technology and pattern generation. These changes are outlined in Table 1.

Table 1 Tukutuku Chronology

Pre-1769-1849	<i>Te Ao Rangatira</i>
	Traditional leadership by hereditary chiefs
1850–1926	<i>Te Ao Poropiti</i>
	Māori Prophets emerge to contest the leadership of hereditary chiefs
1927–1950	Te Ao Paremata
	Māori Parliamentarians institute cultural and artistic change through statute and cultural revitalization strategies
1951–1999	Te Ao Wānanga Hou
	Māori emerge from tertiary art schools and teacher training programs to influence the development of art education in schools and within the marae context
2000	Te Ao Wānanga Rere Hiko
	Māori emerge from tertiary fine arts and Māori visual art programs to extend customary practice in the digital age

Attempts have been made to determine the nature of tukutuku patterns during the period of early European contact. However, what has become apparent from written and visual records up to 1844 is the repetition of a single motif, and a monochromatic or two-color (red and black) painting of the horizontal laths (Fig. 2).

With the advent of European contact, there was a “. . .change from repeating pattern sequences. . .to the composed symmetrical designs of post European work, and. . . the introduction of non-Māori motifs such as squares, octagons, playing card symbols, Christian symbols and representation of objects, both traditional and introduced” (Neich 1993, p. 100). In the latter part of the nineteenth century, there was also an increase in the color palette resulting from the use of Judson dyes as a substitute for customary dyes (Fig. 3).

Te Ao Rangatira Pre-1849: The World of Chiefs

Te Ao Rangatira literally means “the world of chiefs” and references the period when leadership was the prerogative of hereditary chiefs and *wharepuni* (chief’s house) were the premiere structure within tribal villages. In time, European colonization led by Missionaries and later colonial rule influenced not only land ownership but also architectural forms and the art forms within the house. Consequently, chiefs’ houses increased in size to accommodate religious and political meetings thus becoming communal meeting houses rather than a chief’s residence.

Traditionally tukutuku was used in the chief’s house and subsequently the meeting house between the *poupou* (house posts) on the porch and the inside wall of the house. The house posts were either plain, painted with *kowhaiwhai* (nonfigurative pattern), or carved. During the early explorer contact period, carved house panels were only recorded on the East Coast of the North Island and in North Auckland. In the early twentieth century, more durable wall cladding systems such

Nontraditional tukutuku club
pattern. (Image by Robert
Jahnke; courtesy of
Houngarea marae committee)

as tongue and groove were used and arranged diagonally and vertically, as well as manufactured fluted panels simulating traditional vertical reed wall lining.

The earliest reference to tukutuku comes from Lieutenant Roux in 1772 who noted “neatly made lattice work” (Neich 1993, p. 99). The earliest visual recording of tukutuku was made in March 1839 by Richard Taylor, who sketched the exterior

Fig. 4 *Nga Tau e Waru* (1881) Masterton. Traditional fiber-constructed nonfigurative tukutuku panels. (Image courtesy of the Museum of New Zealand Te Papa Tongarewa)

frontal view of two houses at Otumoetai Pa (Tauranga), and in April he sketched the house belonging to the Rangatira Te Kani-a-Takirau at Uawa (East Coast) that showed tukutuku in the porch area (Neich 1993). Porch tukutuku was also applied to the front wall of *Nga Tau e Waru* (1881) a tribal meeting house in Masterton (Fig. 4).

Te Ao Poropiti 1850–1926: The World of Prophets

Te Ao Poropiti is literally the world of prophets named after the proliferation of Māori prophets who contested the traditional hereditary leadership system from the mid-nineteenth century to the early twentieth century. Among the prophets, Te Kooti stands alone as the only prophet who actively fostered the arts of the tribal houses throughout his lifetime. He founded the syncretic Ringatu religion after being falsely accused of spying at the siege of Werenga-a-hika near Gisborne and his imprisonment on the Chatham Islands off the east coast of New Zealand. After escaping from the Chatham's Te Kooti exacted revenge in the Gisborne area before evading Government forces along the Eastern seaboard through the Urewera country, west of Wairoa. Eventually Te Kooti found refuge in the King Country in the central North Island, which was off limits to the settler community and colonial forces. Although he died in 1893 his influence persisted into the 1920s. In his youth, Te Kooti was missionary trained, but he influenced the building of a number of meeting houses either directly or indirectly (Fig. 5).

It is during this time period that innovation in the style of art took on a new turn, including tukutuku design. Among Te Kooti influenced meeting houses is *Te Tokaanganui a Noho* (1873) which was built at Te Kuiti as a gift from Te Kooti to King Tawhiao (King Tawhiao was the second Māori king who succeeded his father Potatau Te Wherowhero. The Māori King movement originated in 1858 in response to increasing settler migration, Crown demands for land and political

marginalization. There was no Māori Sovereign prior to this period as Māori leadership was based on hereditary chieftainship.) for sheltering him from colonial forces in the King Country. Tawhiao was the second Māori King who succeeded his father Potatau Te Wherowhero. The Māori King movement originated in 1858 in response to increasing settler migration, Crown demands for land, and political marginalization. There was no Māori Sovereign prior to this period as Māori leadership was based on hereditary chieftainship. Apart from influencing the introduction of a new range of tukutuku designs including text and playing card symbols, Te Kooti is also credited with the introduction of figurative tukutuku based on the carved *wheku* facial form which appeared on a rear lattice wall panel of the house. The *wheku* facial form is common to most tribal carving traditions and features obliquely set eye-brow and elliptical eye-lids that appear slanted.

By 1888 Te Kooti's figurative schema was expanded by Ngāti Porou house builders in the Porourangi meeting house at Waiomatatini, allowing the carvers to represent additional ancestors within the commemorative scheme of the house. According to Cliff Whiting, the *poupou* (wall posts) represent women and children, while male ancestors (see Fig. 6) are represented in the *tukutuku* (Christenson 2013).

Fig. 6 *Porourangi* (1888) at Waiomatatini, East Coast. Figurative and nonfigurative tukutuku panels. (Image by Cliff Whiting; courtesy of Ramari Collier)

As illustrated in Fig. 6, there was also an attempt to translate cursive patterns, like the shoulder and hip spirals associated with carving and the moko (tattoo) pattern on the forehead, into the rectilinear grid of tukutuku.

As well text makes an appearance in tukutuku where artists used the whole space beneath the legs to inscribe ancestral names with fiber. In other houses, text appeared on porch walls. In an alternative development, messages of welcome in the Māori language appeared among conventional tukutuku patterns like the poutama stairway pattern. Other divergent developments in tukutuku were also introduced as a result of the impact of European colonization, the absence of carving expertise, innovation, expediency, and the desire to record a changing worldview (Jahnke 2006; Neich 1993).

Takitimu (1887) at Martinborough (Fig. 1) featured poutama lattice-work above painted panels based on taniko, the rectilinear patterns that are attached as borders of kakahu (cloaks).

The era from the 1870s through to the 1920s is one of transformation and change as tongue and groove panels arranged vertically or diagonally (with painted vertical boards with kowhaiwhai or naturalistic painted images) and fluted boards replaced tukutuku not only in the porch but also inside the house as well. It was also the era of the painted house which evolved as an alternative to the carved tribal houses (Fig. 7).

In Te Poho o Hinekura (1914) at the small rural settlement of Tuai, the ancestral panels and tukutuku panels are painted in orange and blue poutama (staircase) patterns that are applied to manufactured fluted boards that contrast with the flat panels depicting the painted ancestor. The house was restored in 1977 by a group led by Cliff Whiting.

Fig. 7 *Te Poho o Hinekura* (1914) Tuai, Urewera. Painted poutama tukutuku patterns. (Image by Cliff Whiting. Auckland War Memorial Museum)

In Hinetamatea (c1900) at Anaura Bay (see Fig. 8), the tukutuku panels are comprised of timber tongue and groove arranged diagonally in the lower wall section with linoleum in the upper section. The substitution of linoleum is particularly transformative and innovative and demonstrates the artist's ability to translate customary pattern concepts on to ready-made designs. The symmetrical nature of the composition with rectilinear patterns relating to the composition of stars like the patiki (Coalsack), purapura whetu (star dust), and Te Mangoroa (the Milky way) was no doubt instrumental in the selection of the linoleum.

Te Ao Paremata (1927–1950): The World of Parliament

Te Ao Paremata literally means “the world of Parliament.” It was the period when several ex-pupils from Te Aute Māori Boy's College in Hawkes Bay attended universities and graduated with degrees in medicine and law and who would serve as Parliamentarians during their illustrious careers. The group, which included Sir Apirana Ngata and Sir Peter Buck, made significant contributions to Māori land development and the revitalization of Māori art. As Minister of Māori Affairs in the New Zealand Parliament, Sir Apirana Ngata was responsible for introducing the Act

Fig. 8 *Hinetamatea* c1900 at Anaura Bay, East Coast. Linoleum substitute for tukutuku panels. (Image by Cliff Whiting. Auckland War Memorial Museum)

in 1926 that established the Rotorua School of Māori Arts and Crafts. Ngata was the most highly educated and qualified parliamentarian in the New Zealand Government. He was the first Maori graduate who received a Master of Arts from Canterbury University College in 1894, completed a law degree in 1896, and was admitted to the bar in 1897.

Under Ngata's direction, the art of carving along with the related arts of tukutuku and painting were revitalized, but it was a period largely marked by conservatism and orthodoxy. Under Ngata's tutelage and guidance, a set of tukutuku panels were created for the opening of the meeting house *Te Hau ki Turanga* at the Dominion Museum in Wellington which is now known as the Museum of New Zealand Te Papa Tongarewa. Ngata used stock patterns from his tribal region of Ngāti Porou on the East Coast of the North Island such as *pātikitiki*, *roimata toroa*, *poutama*, and the Ngāti Porou version of the *poutama*.

Correspondence symmetry of tukutuku patterns is characteristic of the Ngata period evident in all the houses created under his stewardship. By way of contrast, *Hotunui* built in the late nineteenth century contains the oldest extant set of tukutuku of any meeting house. The tukutuku in *Hotunui* continue the early nineteenth-century alternation of red and black color (see Fig. 2) together with an asymmetrical juxtaposition of tukutuku patterns across the house and either side of the central front

and central back wall posts. The asymmetrical system evident in Hotunui was reintroduced by Master carver Pakariki Harrison in the 1970s in a house that he carved in Te Awamutu. The Ngata period was one of revitalizing the arts of the tribal house, and tukutuku produced during this period were generally conservative in maintaining priori patterns. The only exception is the continuity of the figurative tukutuku in Porourangi (see Fig. 6) influenced by Te Kooti.

Te Ao Wananga Hou (1951–2000): The World of New Institutions of Learning

Under Ngata's stewardship tukutuku as an art form migrated from the tribal meeting house to churches, marae dining rooms, and assembly halls. Within these contexts, carving was subordinate to tukutuku and more often than not carving featured as frames for the tukutuku panels. Generally, the traditional patterns were reiterated throughout this period. However, there was a shift from the lattice structure to peg board, a composite hard-board with gridded predrilled holes. This enabled new experimentation with raffia, leather, and plastic substitutes for the traditional binding fiber. The pegboard technology produced a single plane ready-made grid for lashing. To overcome the flattened nature of the tukutuku, oblong or half round timber was often fixed to the peg-board surface to simulate the kaho in customary lattice panels.

Many of the projects discussed within the Te Ao Wānanga Hou period are associated with communal projects that have involved communities of learners whether formal or informal educational or community contexts. Many of the projects are linked to tribal structures from ancestral houses, institutional houses (including those located in schools and tertiary institutions) to halls, and marae dining rooms.

The period of Te Ao Wananga Hou, which literally means “the world of new institutions of learning,” was characterized by marae restoration and innovative building projects. Cliff Whiting and Paratene Matchitt emerge during this period as two of the most influential contributors to change in tukutuku practice and design. In the 1950s, both artists were associated with Gordon Tovey's strategy for promoting the teaching of Māori art in schools. Both artists held positions as Māori art advisors for the Department of Education in various parts of the country leaving their inevitable mark wherever they visited and resided.

However, it was not until the mid-1970s and the advent of Matchitt's mural *Te Whanaketanga o Tainui* (1975) (see Fig. 9) at Kimiora that carving, tukutuku, and painting were combined to create radical dining hall murals that enabled tukutuku to migrate from framed lattice panels to purpose designed components within a mural narrative composition.

The mural, combined with a single plane tukutuku fabrication, introduced a radical shift from the rigid rectilinear lattice grid associated with customary lattice structure of tukutuku and predrilled peg-board substitutes to freeform cursive designs following the example of Cliff Whiting. The tukutuku patterns were achieved by drilling the holes for single, cross, and multiple stitches following cursive contours within which the linear patterns were configured on a vertical or radial grid.

Fig. 9 Paratene Matchitt *Te Whanaketanga o Tainui* (1975). Kimiropa Dining Room. Turangawaewae marae. Nontraditional cursive tukutuku patterns. (Image by Paratene Matchitt; courtesy of the artist)

However, the Kimiropa mural owes its realization to Cliff Whiting's *Te Wehenga o Rangi raua ko Papa* in the National Library in Wellington (see Fig. 10) which he created between 1969 and 1975. In this mural, the cursive tukutuku technique pioneered by Whiting is applied to the areas representing the sky, the radiating rays of the sun and Te Ao Mārama, the light that flooded into the world when Tāne separated the sky parents, the light that would see the emergence of the natural world and humankind in Māori tribal narratives.

Whiting's contribution to tukutuku straddles the continuum of Māori art from the conventional to the innovative. In 1969, he was the first practitioner to add carved elements to the tukutuku panels in Waiherehere tribal house at Koroniti on the Wanganui River. He repeated this technique in 1974 in Kauaetangohia tribal house on the East Cape expanding the range of figurative images to include fish. Perhaps his most comprehensive tukutuku statement can be found in Te Rau Aroha dining hall and Tahupotiki tribal house in Bluff (see Fig. 11), the house that Whiting worked on between 1998 and 2001. In the dining hall and house, tukutuku is presented in panel and mural form but can also be found on the roof of the dining hall as substitutes for painted rafters. The use of tukutuku on the roof of a house appears as a Wanganui innovation for the 1870s in Waiherehere at Koroniti. From 1975, Whiting's cursive tukutuku is extended with several customary compositions such as poutama composed in arcs on incised and perforated fiberboard. In a new development however, bracken fern stalks act as kaho following the curved pattern on perforated fiberboard. Over the years, Whiting has introduced a range of imagery including fish, the iconic Te Whānau ā Apanui ancestral form from the Te Kaha pataka (store house) with upraised arms, the Christchurch Commonwealth games symbol, and the rays of Te Ao Mārama among others.

Fig. 11 *Te Rau Aroha* (2003) dining hall mixed media mural at the Bluff, South Island. Nonfigurative roof tukutuku panels. (Image by Cliff Whiting; courtesy of Te Rau Aroha marae)

Sandy Adsett is another Tovey generation artist who is also esteemed as a tukutuku practitioner. His tukutuku panels for the Te Huki House at Raupunga (see Fig. 12) feature a contemporized version of the pātiki (fish) pattern with an internal figurative reference to the raupunga fern from which the village takes its name. Adsett's wall mural relies on layers of relief and paint to create visual relationships to tukutuku patterns like poutama and niho taniwha (teeth of the taniwha).

Pākehā artist Peter Boyd emerges, under the guidance of master carver Pakariki Harrison, as one of the most transformative tukutuku designers combining customary patterns once separated in previous houses like the poutama and kaokao (arm pit design), as well as introducing an expanded color palette. The expanded palette was necessary to capture the subtle overlays and juxtaposition of hues referencing land and sea. Tanenuiārangi (1988) (see Fig. 13) at Waipapa marae at Auckland University is exemplary in its range of tukutuku designs with both figurative and nonfigurative imagery including tiki (human form), poutama, kaokao, and niho taniwha.

Te Ao Wananga Rere Hiko (2000–): The World of Computer Technology

With the advent of the digital age, computer technology impacts on the tukutuku-related arts beyond tribal spaces. While conventional approaches to tukutuku still feature prominently in tribal and institutional spaces like the marae, parishes, diocese, and tertiary institutions, tukutuku transformations have evolved outside these spaces. *Te Ao Wananga Rere hiko*, the world of computer technology, endeavors to capture the transformation of tukutuku processes and patterns in the digital age of pixilation while acknowledging the continuity of conventional translations of tukutuku within the modern era.

Lyonel Grant was trained at the Māori Art and Crafts Institute in Rotorua in 1974. Since graduating he has completed three carved houses, a voyaging canoe and countless commissions. In the *Ihenga House* (1996) at Toi Ohomai Institute of Technology (formerly Waiariki Polytechnic) in Rotorua, Grant was assisted by weaver Christina Wirihana in the creation of plaited whāriki (flax mat) panels as a substitute for tukutuku panels. This alternative process for wall cladding was used in a church in the Bay of Plenty in the 1940s, a tribal house in North Auckland in the 1980s and at Waipiro Bay on the East Coast in 1990. In 2000 Grant used vacuumformed plaited relief panels on the rear wall of *Ngakau Mahaki* (2009) at *Te Noho Kotahitanga marae* at Unitech in West Auckland (see Fig. 14) introducing a unique and bold departure from the tradition of lattice panels of the past.

Fig. 13 Peter Boyd *Tane-nui-a-rangi* (1988). Multicolored nonfigurative tukutuku panels. (Image by University of Auckland; courtesy of Peter Boyd)

In 2000 Kereama Taepa a graduate of the Toi Oho Ki Āpiti school created an undergraduate body of work for his Bachelor of Māori Visual Arts degree using wax crayons arranged in a grid formation in deference to tukutuku. He produced three large-scale relief works as a tribute to Leonardo Da Vinci, two featured the Mona Lisa and the other St John the Baptist. Using a computer to plot the grid Kereama was able to capture the fidelity of Mona Lisa's "smile" (see Fig. 15) while simultaneously referencing tukutuku patterns by altering the relief depth of the black, white, and grey crayons. His approach not only references the pātiki (flounder) tukutuku pattern in a related but different approach to Matchitt, but he was also able to produce a work that was unique in its capture of both figurative and nonfigurative elements simultaneously. The use of crayons also elevates the work to a conceptual engagement where crayons, as the medium of representation become the building blocks for a relief sculpture. Scale is a critical factor in the work in order to allow the pixelated pattern of crayon circles to fuse as they do in a pointillist painting.

In contrast to Kereama's computer plotted grid, Gina Matchitt, also a graduate of Toi Oho ki Āpiti, resorted to recycled computer keys to plot her references to range of tukutuku patterns including kaokao, poutama, and pātiki among others in her 2007 pre-Master's thesis exhibition *E Kare You're so Colonised*. The panels at 2400 mm × 1200 mm were a parody on literacy as a colonizing process where computer keys with imprinted letters, numerals, punctuation marks, and commands are reordered according to color rather than any literary or numerical order to generate patterns about cultural beliefs and values. The works stand tall and proud in an act of colonizing the colonizers system of communication (Fig. 16).

Peata Larkin created a series of tukutuku inspired works by forcing blobs of acrylic gel pigment through whitened mesh weave. The work is seductive in its tactile nature, the apparent randomness in the fusing and mixing of pigments, and the tendency of the pigments to disrupt the regularity of the mesh structure. The result can be viewed as

Fig. 14 Lyonel Grant *Ngakau Mahaki* (2009) Unitech, West Auckland. Vacuum formed rear wall plaited relief panels. (Courtesy of the artist)

Fig. 15 Kereama Taepa *The smile* (2007). Crayon relief combining nonfigurative tukutuku patterns with a portrait of the Mona Lisa. (Image by Bridget Reweti; courtesy of the artist)

expressionist tukutuku in terms of the splatter-like appearance of the paint. In her 2010 *Woven In-Pixelled Out* exhibition, she introduced a light box version of the paintings that introduced another level of luminescence into the work almost like stained glass as the blobs of pigment glow like gemstones. When the light is turned off the works project another layer of engagement in the tactile nature of the blobs of pigment with their impressionist juxtapositions. With *E Tu* (Explorer) 2012 Larkin introduces a black and white pixelated ground of pictograms that bring an added visual language into the process of navigating the actual and the digital. The tukutuku reference remains in the “stairway to heaven” pattern, but overall the painting is more akin to taniko (hand-weaving) with its minute figurative ground of signs from European and Māori culture both past and present. The new work also sees a shift away from the overpowering symmetry of the previous works to the inclusion of an asymmetrical counterpoint in the background. The works are more intimate in scale compared with “stairway to heaven.” (Figs. 17 and 18).

Artist and art educator Lisa Reihana has been at the forefront of video and new media arts since the 1990s. One of her major projects *Digital Marae* (see Fig. 19) was exhibited at the Auckland City Art Gallery in 1998 and 2002 and accessioned in 2003. Over the years the project has undergone a number of configuration changes. Its configuration in 2007 at the Govett Brewster Art Gallery resulted in its selection for the 2008 Walter's Prize and attracted The Anne Landa Award in 2009 for video and new media arts.

The tukutuku animations are accompanied by digitally manipulated references to ancestral wall posts in tribal houses comprising deity of old like Mahuika the goddess of fire and modern day heroes such as a Dandy dressed as a Victorian gentleman representing takatāpui (transgendered identity) to evoke a tableau of identities that present a continuum between past, present and future. For the artist, the figurative images are about being connected in space and time and about being Māori. It is a project that translates the honorific context of carved ancestors flanking woven tukutuku panels within ancestral houses into a digital marae with digital poupou and digital tukutuku. The resulting installation is a feast for the senses as one is confronted with digital portraits of over human sized ancestors, animated tukutuku sequences, and sound within an immersive environment.

In 2009 Kura Puke exhibited *Muramura* at the Pataka Art Museum as partial fulfilment of her Master of Māori Visual Arts degree. The exhibition later featured at Pukeariki Museum in New Plymouth and Te Manawa Art gallery in Palmerston North. The exhibition was a development of experimental work created in the previous year using computer programmed fiber optic illumination of dots of light configured to simulate tukutuku patterns. *Muramura* referenced tukutuku patterns with astrological connotations like purapura whetu (star dust) and pātikitiki (the Coalsack constellation) to create a narrative of cosmological origin. The 12 screens (1200 mm × 400 mm) alluding to the tiered heavens of Māori tradition created a spectacle of celestial illumination that was poignant in its reverential acknowledgment of oral traditions in which Tanenuiārangi clothed Ranginui the sky with a cloak of stars (Fig. 20).

Fig. 19 Lisa Reihana *Digital marae* 2001–2012 Edge of Elsewhere Campbelltown Art Centre, Sydney. (Digital prints and animation juxtaposed to simulate interior of a tribal house by Lisa Reihana; courtesy of the artist)

Fig. 20 Kura Puke *Muramura* (2009). Animated fiber optic panels referencing traditional rectilinear and nontraditional cursive tukutuku patterns. (Image by Kura Puke; courtesy of the artists)

In 2010 recent Masters graduate Karangawai Marsh extended tukutuku from the flat viewing plane into a cylindrical format with vertical wooded dowels and plastic ties with fluorescent illumination housed within the cylinders. Instead of creating rectilinear patterns, she used text and numerals to reference shorthand text messaging using Māori phrases. Hence, KOWHATU meaning stone or rock became KO42. “WHA” is the Māori term for number four and “TU” is pronounced phonetically as the numeral for two (Fig. 21).

Marsh’s approach has the closest affinity with traditional practice with its integration of a binding system of plastic ties and a lattice structure of wooden dowels (vertical as opposed to horizontal) for pattern generation while breaking from the flat plane presentation of tradition to tukutuku in the round. A similar physicality is maintained with Kereama’s crayons, Larkin’s paint blobs, and Matchitt’s re-cycled computer keys. With Reihana and Puke, the computer generated and powered imagery renders tukutuku as digitized animations of light.

Recent developments beyond the conventional tukutuku lattice structure have evolved within an educational context fostered to a large extent by exhibition spaces beyond the tribal marae context. The shift from “traditional” medium, technique, and subject matter coincides with a shift in tertiary education art programs and an increase in Māori-centric visual arts programs since the 1990s, an increasing referential acknowledgment of the value of traditional Māori art as a source of inspiration and the use of computer technology.

Fig. 21 Karangawai Marsh *Kowhatu* (2010). Circular illuminated text panels using fluorescent lights, wooden dowel, and plastic ties. (Image by Bridget Reweti; courtesy of the artist)

Conclusion

Tukutuku as an art evolved out of the lashing of the walls of tribal houses into a form of house embellishment using vertical strakes overlaid with horizontal laths bound together with fiber in its natural state or dyed. Overtime patterns evolved that related to narratives of migration and Māori aspirations in terms of leadership or battle or death. Patterns were rectilinear, conditioned by the grid format of the lattice structure with a limited color palette. This was the period when tukutuku evolved as a distinctive architectural art form alongside painting and carving during the age of traditional chiefly leadership.

With European contact and the advent of literacy, text entered the tukutuku pattern range alongside religious, playing card symbols, and images of ancestral carved effigies. Painted patterns and even linoleum were introduced as alternative systems for tukutuku embellishment. Much of this transformative practice happened under the influence of the prophet leader Te Kooti. At the heart of Te Kooti's vision was a desire to make carving, painting, and lattice work accessible to his Ringatu congregation. In this respect, there was a didactic intention that drove his vision.

For a time, there was a period of conservatism that was spawned by Ngata's desire to reinvigorate a dying art and to resurrect the traditional patterns and techniques of the past as templates for the future. Ngata's vision and drive resulted in the establishment of a School of Māori Arts and Crafts and a building and restoration program that ensured the continuity of tukutuku as an important corollary to carving and painting. In the process, Māori art was reinvested with its former vitality. But Ngata's vision did not have a place for the liberalism of Te Kooti, and the renaissance of Māori art went hand in hand with the suppression of the painted histories of the late nineteenth and early twentieth centuries.

In time the introduction of new fiber-board resulted in the two-layer lattice system being replaced by a single-layer system and the introduction of curvilinear tukutuku patterns. Teacher, educator, and artist Cliff Whiting stands as the inspirational leader

of the era whose involvement in marae projects has resulted in an unparalleled development of a range of tukutuku innovations within the tribal context that straddles the 1970s into the twenty-first century. Ironically while it is a period that saw graduates emerge from tertiary art training institutions, it is also a period when many of the graduates return to the marae environment to inspire a new generation of artists and educators. It was also a period of the restorations of painted houses associated with Te Kooti where tukutuku was simulated in paint or replaced by linoleum. The inherent attraction of tukutuku is a three-dimensional process that translates images into pattern that maintain a rectilinear two dimensionality. This retention of two dimensionality regardless of materials and techniques is an enduring feature of tukutuku over time. This relates back to its original function within tribal houses as an iconographical and rectilinear counterpoint to the carved ancestral wall panels and curvilinear painted rafters. In houses like Mihiroa at Pakipaki in Hawkes Bay, there are no carved panels; tukutuku and kowhaiwhai stand as the champions of tradition.

Inevitably the age of computers would impact on Māori artists trained in the art schools of the new millennium as they searched for innovative ways to express their identity as Māori, and accessioning the art of tukutuku as a template for artistic engagement and transformation. The works of Reihana and Puke are exemplary in their use of computer technology. However, the conventional form of lattice work of tukutuku continues today. In 2013, a number of Māori weavers were involved in creating tukutuku panels for the United Nations Building in New York led by Christina Wirihana. The commissioning of the panels clearly demonstrates an appreciation of customary aesthetic of tukutuku with painted wooden kaho (vertical strakes) and dyed fiber.

Tukutuku in all its innovative forms is still the art of ancestors whether presented in tribal, educational institutional, or gallery spaces. In the art of tukutuku, the cross-stitches that bind strake and lath are believed to be the eyes of ancestors. In a darkened space, fiber optic pins of light twinkle like stars in the night sky. With Puke's magical rectilinear and curvilinear works, the native and the exotic merge in a narrative of the universe that has its origin the eye of the sky father in Māori tribal narrative – Ranginui e tu ake (Rangi the great one who stands above).

Abstract

An indigenous, specifically Māori worldview is used as the foundation for a case study that describes the people and their relationships and interactions in one New Zealand primary school (ages 5–11). We contextualize this school and its people, within the education and schooling system since the introduction of a new leadership team in 2011. We consider how leaders, teachers, and *whānau* (family and extended family) have promoted contexts for learning to ensure Māori students can enjoy and achieve education success as Māori (Ministry of Education 2013). Leaders' and teachers' beliefs, and their principles for practice, are detailed alongside the changes in Māori students' experiences. Finally, we consider these principles for practice in terms of their relevance for other indigenous and nonindigenous students. The case concludes in 2017 when, for the second successive year, the school became a finalist in the New Zealand, Prime Minister's Excellence Awards in Education for teaching and learning.

Introduction

E kore au e ngaro, he kākano i ruia mai i Rangiatea.

I will never be lost, for I am the seed which was sown from Rangiatea.

Like the potential signaled in this *whakataukī* (proverb/wise saying), this case is a story of educational success. However, the issue of lost potential is an intergenerational reality for many Māori students in New Zealand schools. Data from New Zealand's official secondary school qualification, the National Certificate of Educational Achievement (NCEA), the Programme for International Student Assessment (PISA), and the Progress in International Reading Literacy Study (PIRLS) all highlight an achievement gap between Māori students and their non-Māori counterparts. This longstanding gap is indicative of the deeper issue of "education debt" (Ladson-Billings 2006) that Ladson-Billings (2008, p. 3) in her research about African-American students defines as "longstanding inequities and educational disenfranchisement," based on the historical, socio-political, economic, and moral inequities, which have never been repaid.

Māori student and *whānau* narratives, recorded in projects such as *Te Kotahitanga*, indicate the ongoing impact of pathologizing practices and deficit discourses in New Zealand (Bishop and Berryman 2006; Shields et al. 2005). Education debt is also evident in the consistent achievement disparities between Māori and non-Māori students, which are present at 5 years of age on entry and that often continue to widen throughout schooling (Office of the Auditor-General 2012,

2013). Descriptions of high-quality and low-equity education systems, driven by deficit-oriented approaches, are familiar to educators across the world (Sleeter 2011). Ladson-Billings (2008, p. 3) likens the reduction of the achievement gap to achieving a balanced budget without addressing the bills of the past. This achievement gap is widely focused on through the media, within schools and at a political level. In New Zealand, teacher professional development focuses on the reduction of the gap and school reporting is mandated by the Ministry of Education to include an Analysis of Variance. Using quantitative and qualitative evidence, schools report on the gaps in achievement against the past year's student progress of achievement. Overall, the evidence shows this gap continues to be entrenched through the education system provided by the state, with very few enduring examples of closure.

Important Historical Markers

The current New Zealand education system was shaped with the signing of The Treaty of Waitangi on February 6, 1840, by representatives of the British Crown and approximately 512 Māori tribal leaders. It is important to note that two versions of this Treaty were signed: one in English and one in Māori. The Treaty was initially written in English by two crown representatives, then translated into *te reo Māori* (the Māori language) by two others. This translation and its interpretation differed greatly from the English version. Orange (1987) noted that only 39 *rangatira* (tribal leaders) signed the English version, which then became the official version. Māori viewed the Treaty as a reciprocal agreement, an *operational partnership*. However, the European settlers were operating under a “fundamental belief in the inherent inferiority of the Māori people” (Shields et al. 2005, p. 57). This fundamental difference of interpretation has had huge ramifications for all New Zealanders, and in many respects, it has continued to be perpetuated through the education system.

As in many other colonized countries, New Zealand's earliest schools were mission schools, which operated to *civilize* Māori through Christianity. The medium for instruction in these schools was *te reo Māori*, with many historians noting that Māori were keen to learn reading and writing and were quick to adapt these skills to further enhance their own means (Bishop and Glynn 1999). Following the signing of the Treaty, the colonial government was established, and in 1843, the Colonial Office decreed that all Māori were under the Queen's rule, signatories or not. The Native Trusts Ordinance was established to focus on the “welfare and protection of Māori, offering a solution through education and assimilation” (Tauma 2015, p. 16). Subsequently, in 1847, government funding for mission schools was provided on the proviso that instruction was in English only. This move established, through British rule, education as the means for social control. The subsequent Native Schools Act of 1858 included policies geared towards assimilation through the rejection of Māori knowledge and values and went on to establish a separatist education system: Native schools for Māori, the other for non-Māori or Pākehā children of the colonial settlers. According to Shields et al. (2005, p. 63), this was justified by “pathologizing Māori people's abilities to cope with, in this instance, a modern schooling system.”

Educational policy and practice was geared towards one future for Māori, that of laborers and domestics, and a separate, more academic focus for Pākehā children. Teachers were only permitted to use Māori as a means of introducing English. By the turn of the century in 1900, children were punished for speaking Māori in school and parents raised their children speaking English to avoid their children being punished (Berryman and Macfarlane 2017). The prohibition of te reo Māori in schools, often enforced by corporal punishment, had devastating effects on the Māori language. In 1930, for example, a survey of Māori children attending Native Schools estimated that 96.6% spoke Māori at home. By 1960, only 26% spoke Māori (Shields et al. 2005). Today, the number of Maori speakers is even less. Furthermore, the restricted curriculum offered Māori very few opportunities for higher education and limited employment opportunities. Native schools did not offer the required subjects for matriculation to higher education. At the time, one secondary school, Napier's Te Aute College, led by a non-Māori principal, stood against this policy and offered the required subjects for matriculation. However, a government inquiry in 1928 forced the school to return to its previous curriculum (Consedine and Consedine 2005). During this small window of opportunity, New Zealand's first Māori university graduates, including Māori politicians and leaders such as Sir Apirana Ngata and Sir Maui Pomare, matriculated from this school.

The Ongoing Pathology

During the period of mass Māori urbanization, to seek employment following the Second World War, Māori children moved away from the largely rural Native schools and had to attend state schools. Leaving behind older family members, and with them the remaining vestiges of their own language and culture, coupled with entering a compulsory education system based on low academic expectations of Māori, deficit thinking and the derogatory representations of Māori in textbooks and reading materials, resulted in further exclusion from academic success for Māori (Bishop and Glynn 1999). Shields et al. (2005) identified that values, such as individual competition and achievement, stood in opposition to core values within the Māori culture of reciprocity in teaching and learning and the importance of relationships and responsibilities of interdependence. This *talking past each other* (Metge et al. 1978) resulted at best in cultural confusion, at worst in cultural genocide, and this was often manifested as a lack of engagement, poor behavior, and subsequent low achievement. Situations like this continued to reinforce the deficiency discourses prevalent among educators and the ongoing inequity for Māori (Bishop and Berryman 2006).

Resistance and Potential

In resistance to both the colonizing of education for Māori and the ongoing decimation of te reo Māori, the kaupapa Māori movement began to set up a very effective

Māori language immersion system for education outside of that provided by the state, beginning with Kōhanga Reo (Early Childhood Māori immersion language nests) in the 1980s (Pihama et al. 2004; Hohepa et al. 1992). Māori resistance and solution seeking continued (Smith 1997) and, from the turn of this century, a move away from focusing solely on the barriers to learning for Māori saw a long-awaited shift towards listening to *iwi* (tribal groups of indigenous Māori people in New Zealand) and a focus on Māori potential in English-medium education, both in policy and practice. *Iwi* had become increasingly strident in voicing their discontent with an education system where Māori consistently were forced to leave their culture at home. Instead, *iwi* wanted to become active determinants in the pathway education should take for Māori. A series of four *Hui Taumata Mātauranga* (Education Summits) were hosted by *Ngāti Tūwharetoa*, a central North island *iwi*. Education officials and politicians attended the hui and listened as Māori parents and grandparents spoke of their aspirations and hopes for their children through education. A second Hui Taumata was held in November 2001, focusing on leadership in education and the place of Māori in education authority. A third, held in March 2003, looked at the quality of teacher education and Māori experiences in the tertiary sector.

Ka Hikitia Māori Education Strategy

In 2008, largely as a result of these education summits, the New Zealand government created the *Ka Hikitia-Managing for Success* strategy, followed by the *Ka Hikitia-Accelerating Success* 2013–2017 (Ministry of Education 2008, 2013). This strategy aimed to make significant changes to Māori student achievement in the next 5 years and beyond through the underpinning values of quality teaching and learning and strengthened engagement of students and whānau. The Ministry of Education website tells us that *Ka Hikitia – Accelerating Success* is “our strategy to rapidly change how the education system performs so that all Māori students gain the skills, qualifications and knowledge they need to enjoy and achieve education success as Māori” (Ministry of Education 2013). *Ka Hikitia* is defined as “to step up, to lift up or to lengthen one’s stride” and challenges educators with, “stepping up how the education system performs to ensure Māori students are enjoying and achieving education success as Māori” (Ministry of Education 2013). The website spells out that when this vision is realized, all Māori students: will have their identity, language and culture valued and included in teaching and learning, in ways that support them to engage and achieve success; know their potential and feel supported to set goals and take action to achieve success; experience teaching and learning that is relevant, engaging, rewarding, and positive; and have gained the skills, knowledge, and qualifications they need to achieve success in *te ao Māori* (the Māori world) New Zealand and the wider world.

In 2016, while there was evidence of changes within some schools, the overall conclusion of the Auditor-General was that “the implementation of *Ka Hikitia* was originally flawed by a slow and unsteady introduction by the Ministry of Education”;

“Ka Hikitia was not effectively communicated to schools”; and in the words of a senior Ministry of Education official, “the implementation of Ka Hikitia was faulty because it relied too much on goodwill and devolved responsibility” (2016, p. 19). Although in 2017, this policy is due to end, schools, such as the school in this case, have benefitted from the guidance provided by this policy.

Methodology

This chapter is told by members of the senior leadership team, of an urban primary school, and a researcher who has been working closely with this school. Together they constitute a research-whānau (Berryman 2008) or, as described by Bishop (1996), a research whānau of interest. As such, they are a group of people, using a kaupapa Māori approach that reinforces Māori knowledge and self-determination to act as a metaphoric whānau, in the telling of this story. This story is told as a case study using both qualitative and quantitative data, gleaned from recent school documents and people’s experiences within the school. The case tells a story of shift, from the repositioning of teachers, to the reduction of the achievement gap and in turn to agency of students and whānau, towards collective capability and adaptive expertise as described by Groff (2012), and through the development of a shared vision with moral purpose (Berryman and Eley 2017a).

Kaupapa Māori Research

Bishop (2012) defines a kaupapa Māori approach as one that challenges the dominant discourses in education through tino rangatiratanga (self-determination), by and for Māori. This approach calls for decolonization through resistance to the entrenched colonial agenda (Smith 1999) and assuming positions of authority to transform and reposition power relationships as the partnerships mandated by The Treaty of Waitangi. It aims to create a sense of moral purpose and a growing sense of responsibility for educators to address the need for a shared vision for Māori students’ achievement, created through culturally responsive, power-sharing relations between stakeholders. A kaupapa Māori approach connects with Māori political, social, economic, and spiritual aspirations, and it can provide guidelines embedded in te ao Māori, for what constitutes excellence for Māori in education (Smith 1997).

Case Study Research

Case study research can involve both qualitative and quantitative research and aims to gain in-depth understandings of a research site by studying the relationships and interactions as they occur in their real-life setting. Stake (2000) describes a case study as the study of a functioning, specific, integrated, and *bounded system*. Denzin and Lincoln (1994) also describe a case study as a bounded system and suggest that

this type of study involves the study of a single instance in action. Stake (1994) suggests, however, that although certain features sit within the system or the boundaries of the case, other features that might sit outside the case, for example the historical or political events, can also provide important contextual information. Case study research therefore provides opportunities to learn about the case as well as from the process and from the product of the learning.

Participants and Procedure

This case is contextualized within the historical and contemporary education policy and schooling system in New Zealand. It is bounded by two points in time: 2011 – when a new senior leadership team was introduced to this school and its community and 2017 – when this chapter was written. The principal is of Samoan heritage, the deputy principal has Ngāti Porou connections, and the researcher has connections to Ngāi Tūhoe, Ngāti Awa and Ngāti Whare. Two distinct pathways have brought them together: the first being academic study and the second the new policy pathway for professional development in schools known as Kāhui Ako. This case is told through the direct experiences and learning outcomes of this school and its community.

Invercargill Middle School: Te Kura o te Puna Wai Ora te kura

*Ko Waipourewa te maunga
Ko Ōtepunī te awa
Ko Murihiku te rohe
Ko Te Kura o te Puna Wai Ora te kura
E tu atu nei mātou
Ānei mātou. No tēnei kura, hei tauira.*

The case begins by making formal, cultural connections to the important land marks and people of the region, within which the school is located: the mountain, *Waipourewa*; the waterway, *Ōtepunī*; and to the people, *Murihiku*. This greeting continues by introducing the school's Māori name, both a direct translation and a metaphorical connection to the potential of the school, as a spring with waters of wellbeing. It concludes by calling attention to the people standing together within. *Here we are. In this school, learners.*

Indigenous Leadership

Through an indigenous Māori lens, the leaders and teachers at Invercargill Middle School – Te Kura o Te Puna Wai Ora – are transforming this school. Students' potential and successes are at the heart of the schools' core purpose and students,

Māori, and non-Māori (Pākehā and *Tauīwi*, more recent immigrants) are thriving. Alton-Lee (2016, p. 36) describes indigenous leadership as responding to “the ways of knowing of the people most affected by educational disparities” by building upon “Māori aspirations, preferences and practices for educational reform.” This model, as with this school, views culture as a resource that can be deliberately used to draw upon Māori knowledge thus accelerating progress for Māori students, while also benefitting non-Māori with new ways of being and new learning.

Invercargill Middle School is a year 1–6 school, located in the middle of Invercargill, hence the name Middle School. Invercargill is the most southern city in the South Island of New Zealand. The *mana whenua* (locally affiliated tribes) are of Kai Tahu, Kati Mamoe, and Waitaha descent. There are also many families in the region, affiliated to iwi from the North Island, in particular Ngā Puhī and Ngāti Porou. These families migrated south in the 1950s–1960s seeking employment in the farming, shearing, and freezing work industries that at that time were thriving. The school is on a small site and given that it is in the middle of the city, it has a predesignated zone for student enrolments. The school is one of the oldest in Invercargill and has buildings that reflect this. Students come from a mix of low cost rental properties and middle income New Zealand housing. Contributing to the special nature of the school are the 22% Māori students on the roll. The school’s leaders and staff are actively using a kaupapa Māori approach to transform the school culture and in turn the achievement of these students. In so doing, they are respecting their responsibility to the mana whenua community. Another aspect of the special nature of this school is provided by the local tertiary provider, The Southern Institute of Technology, which is located within the school’s zone. This institute provides a lot of accommodation for families, meaning that the school roll includes a number of international learners whose parents are studying. A high number of these learners are English Language Learners. There are also a number of transient students who enroll in the school from around New Zealand and may stay for a year or less before moving to another part of the country. The international and transient numbers in the school have averaged 16–18% of the school roll since 2011. In 2017, it was up to 25%.

Today, in order to achieve equity and excellence for all students, the Treaty of Waitangi principles of participation, protection, and partnership are at the forefront of the school’s delivery of the New Zealand curriculum (Ministry of Education 2007). The core principles of *whanaungatanga* (the act of developing familial type relationships and responsibilities), *ako* (unified and reciprocal responsibilities to both learn and to teach), *manaakitanga* (care for people and provide hospitality), and *mahi tahi* (to work together as one) are also embedded into all aspects of school life. We now return to 2011 to contextualize this journey.

In 2011

In 2011, the school staff numbered 16: eight classroom teachers, the principal, and seven support staff. Of these, 14 identified as New Zealand European/Pākehā, one as Ngā Puhī and the incoming principal was of Samoan descent. His first appointment as deputy principal was a young woman of Ngāti Porou and New Zealand European

descent, with 12 years teaching experience within *Reo Rua* (Bi-lingual Māori English) settings. Her initial focus was curriculum and teaching practice reform.

At the time, the school was challenged financially, relationships were not good, and student achievement clearly indicated that teaching practice, assessments, policy, and curriculum needed some serious considerations. The student achievement data gathered for all learners achieving at or above the National Standard showed:

- Reading 79%
- Writing 59%
- Math 80%

The achievement data for Māori students were:

- Reading 79%
- Writing 50%
- Math 79%

Of concern, was a belief that the reliability and validity of these data might well be compromised due to the lack of robust moderation throughout the assessment procedures. For example, the Education Review Office (ERO), the official agency for evaluating and reporting on the education and care of children and young people in all New Zealand education institutions, had identified the school as in need of careful monitoring and support. This review, conducted shortly after the current principal was appointed, stated areas for significant improvement including:

- *Most students need to make accelerated progress.*
- *Set targets to raise Māori student achievement in consultation with whānau progress.*
- *More cohesion between Charter, curriculum plan, class programs.*
- *Appropriate priority in Charter re raising student achievement.*
- *Accountability and clarity of roles and responsibilities for leaders and trustees.*
- *Consistent implementation, monitoring and review of plans and systems developed (including PMS [Performance Management Systems], review of school programs and practices).*
- *Effective assessment practices, OTJs [Overall Teacher Judgements], including re National Standards.*
- *Moderation for consistency and reliability.*
- *What constitutes high quality teaching. (ERO 2011)*

Reflecting these assessment practices against relevant research from other schools, the leaders, teachers, and members of the Board of Trustees (BOT) found that the teaching, learning, and assessment practices within the school:

- *Were not reflective*
- *Were not truly collaborative*
- *Did not genuinely acknowledge the aspirations of Māori*

- *Were not improving achievement levels over time*
- *Were not intentionally seeking a research base for improvement (BOT report 2012)*

In response, focus lines of inquiry were developed in order to transform these practices. The questions included:

- *How can learners' progress, in particular Māori learners, be accelerated so that they are able to achieve at or above their current levels?*
- *What teacher knowledge needs to be built in order to improve learner, and in particular Māori learners' outcomes?*
- *What systems can be developed to require teacher, management, and board reflection to improve practice?*
- *What concepts and values need to develop in order to achieve learner, in particular Māori learners, outcomes?*
- *How could a culture reform encourage continuous improvement, equity, excellence and agency alongside a sense of belonging and cultural located-ness? (BOT report 2012)*

A teacher, recalling the situation the school was in before the transformation occurred recalled:

The school that [the leadership] inherited, even if people were motivated and wanted the best for their students, there wasn't the same urgency, there wasn't the same collective accountability. . . (2016, ERO video series)

Reforming the School Culture

Taking an indigenous leadership lens, the principal decided to focus first on the development of respectful working relationships, applying the elements of dialogic practice to begin the repositioning towards more positive relationships between and among staff members, parents and students. By 2012, this thinking was evident in the School's charter where it was stated that "We have already identified whanaungatanga/community care as being an important aspect about our school. We celebrate the diversity we have in cultural groups, family types and income brackets." Exemplifying the focus further, the leadership team determined that "*Whanaungatanga*: [would involve] actively engaging in respectful working relationships with Māori learners, parents and whānau, hapū, iwi and the Māori community" (Invercargill Middle School Charter 2012). Māori cultural understandings such as whanaungatanga were established with reference to Tātaiako, the cultural competencies for teachers of Māori learners (Ministry of Education 2011). Tātaiako is a resource designed for use with the Graduating Teacher Standards and Registered Teacher Criteria (New Zealand Teachers Council 2009) and promotes other cultural

understandings such as Manaakitanga; *Tangata Whenuatanga*: respecting and caring for the land and the people; and Ako. It was from this position and these central cultural tenets that buy-in and ownership was spread across the school and the reform began to develop.

Another action taken by the school leadership was to establish a sense of *turangawaewae* (location and connectedness to the land) within the school. A close personal whānau relationship between the Deputy Principal and a local highly respected *kaumatua* (tribal elder) Riki Cherrington, whose children had attended the school in the 1970s–1980s and who had been a Board of Trustees member, provided the connection and impetus. Through *whakapapa* (history and genealogy), the *kaumatua* gave the school its Māori name, *Te Kura o te Puna Wai Ora*, the school of the fresh water spring, referencing literally the fresh-water spring at the location where the local iwi refreshed themselves, resting on their long journey to the *motu īīī* (mutton-bird islands) each season; and metaphorically to the springing forth of knowledge through the teaching and learning taking place. The *kaumatua* visited the school frequently and through dialogue with the principal and teachers maintained a deep connection with the school and its people. He composed a school *haka* (group performance that issues forth a challenge), which begins with the line *Te Puna Wai Ora, e tu atu nei e* (stand up, stand strong, and be proud), and this became the school motto. Every student in the school knows this *haka* and it is celebrated weekly during *kapa haka* (Māori cultural performing arts) and at all school events such as school assemblies, prize-givings, and school productions.

The gift of this new name and motto provided the focus for a series of artworks which now adorn the school and are constant visual representations that promote indigenous Māori culture as normal, valuable, and important. The first of these is a series of murals, designed and painted by the students and staff, representing the school name literally and metaphorically. The second is a series of window wraps representing the school values of Ako, Manaakitanga, and Whanaungatanga. These values encompass cultural location, as through a Māori worldview, and with these aspirations and knowledge as integral to the school. The window wraps communicate these values through the application of *kowhaiwhai* (traditional Māori patterns) to represent the school name and values. Through the design process, the teachers and students engaged in dialogue towards developing shared understandings of the meaning of each value. Currently a staff member's son, a talented *kaiwhakairo* (carver) has been commissioned to design and create several art pieces representing the concepts of the school values as well as, *Poutama Mātauranga* (stairway of knowledge), the school name and motto. These carvings will be displayed at significant areas around the school and will be developed into the school logo to be displayed on the school uniform, letterhead, and signage. Normalizing Māori cultural iconography, as an important part of the school culture, has increased students' sense of belonging.

Through the development of the school values and the collection of student and whānau voice throughout this time, the school leadership responded to the growing need to provide opportunities for further learning in te reo Māori. The principal, deputy principal, and Board of Trustees surveyed the school community and

responded to the positive interest by establishing a Level 3 Immersion Reo Rua class at the school. The location of the class was deliberately at the heart of the school, and the decision was made that the class be named as Room 4, in line with the other classrooms, therefore locating this class as connected and a part of the whole school culture.

The class continues to operate, is open to students from years 2 to 6, and is taught by the Deputy Principal. The teaching and learning includes both te reo Māori and English and operates within an additive strategy to bi-literacy, whereby students add to their lexicon, or mental dictionary, words and phrases in both languages and utilize this learning interchangeably as they choose. Aspects of front loading and dialogic teaching practices defined by Lyle (2008) as “what happens when teachers and pupils work together to build on their own and each other’s knowledge and ideas” (2008, p. 230) support the development of te reo Māori. Within the classroom, the curriculum is delivered through a Māori worldview with cultural responsiveness (Bishop and Glynn 1999), viewing the cultural knowledge of students, their prior knowledge and experiences as important in the construction of new knowledge (Bruner 1999). In recognition of the first group of students to transition on to secondary school from this class, the students and teacher investigated *tukutuku* (traditional Māori woven panels) and designed and created a series of panels that tell the story of the school values and motto within the patterns. These panels now adorn the school hall and are the backdrop for all school activities that take place there, including weekly assemblies. The school kaumatua blessed these panels during an assembly, making this a special memory as it was the final school function he attended before his passing.

Reforming Leadership

As discussed previously, the central vision of Ka Hikitia, the MoE’s Māori Education policy strategy (Ministry of Education 2008, 2013), aims for “Māori students to enjoy and achieve education success as Māori.” Accordingly, Invercargill Middle School set out to achieve this for Māori and in the same way, aimed to achieve greater success for all students by ensuring their success was not at the expense of having their own home cultures assimilated by that of the school. This was achieved through the deliberate exploration and implementation of knowledge and relationships that come from a Māori world-view, through the co-construction of culturally responsive practices and through the deliberate relationships forged with all members of the home community. Constructivist theories describe culture as super-organic, one that institutions both create and in turn, are created by (Bruner 1999). According to Bruner, one’s *cultural toolkit*, their prior knowledge and experiences, are thus essential in the construction of new knowledge. Through their own application of culturally responsive leadership (by listening to students, parents, and teachers), school leaders aimed to transform the culture within the school and thus created by the school, by providing the agency to enact change in response to the *Ka Hikitia* policy strategy as described above. They did this by using Ka Hikitia as the mandate and then providing teachers

with both the will and skills, through understandings of *Mauri Ora* (emotional, social, cultural, and academic well-being), to provide equity, excellence, and belonging for all students in the school (Berryman et al. 2016). Like a socio-cultural view of the mind, one of the contentions of neuroscience is that learning occurs through social interactions; therefore, the organization of learning should be highly social (Groff 2012). However, increasingly many schools, through required testing regimes, are becoming places that appear more interested in the narrowing of the curriculum with independent transmission of learning and competitive scholarship. Organizational factors, such as shared vision through strategic leadership, participation, and aligned goals, are also key factors that significantly impact on efforts to improve student achievement (Timar and Chyu 2010, cited in Hynds et al. 2016, p. 539). The key role educational leaders play in “developing expectations for improved student outcomes and organizing and promoting engagement” (Timperley 2008, p. 22) has been identified as a powerful catalyst for transforming practice at a whole school level. Research tells us that “according to dialogism we produce and organize social reality by talking and writing” (Lyle 2008, p. 225); therefore, through their acts of teaching and learning about language, reading and writing the teachers and leaders at the case study school enacted social and cultural reform.

Reforming the Pedagogy

At Invercargill Middle School, all aspects of teaching and learning now operate from an additive perspective, which means every team member brings value and innate worthiness or *mauri* just by being a part of the team, and that any professional development must add to that value rather than replace or subtract from it. The leadership team constructed the teacher professional development methodology through a *kaupapa* Māori lens, which operates within the context of *whanaungatanga*; defined by Bishop et al. (2014b) as culturally responsive relationships, evidenced by classroom practice that provides appropriate cognitive demand, student engagement, and dialogic teaching and learning practices. There is a collective responsibility to show *manaaki* (caring hospitality), *tiaki* (nurture and guidance), *awhi* (helpfulness), and *aroha* (love) to each member of the group, while maintaining a focus on the task or purpose. This approach avoids singling out individuals and taking collective responsibility for achievement. Through relationships that respect and care for each other, rather than being coercive or demanding of the other, power is shared and responsibilities are interdependent. Learning is interactive and interpersonal through dialogic practice and participants are connected and committed to one another. Bruner (1999 p. 181) describes this as the *interactional tenet* whereby learning is co-constructed through interaction. Leaders and teachers provide opportunities for the discovery of principles and ideas through active dialogue with and between participants and reject the model of Initiation-Response-Feedback (IRF) more favored by mono-logic pedagogy (Lyle 2008). Curriculum material is delivered in a spiraling manner, in order to build on previous learning. This includes the consideration of the participants’ prior knowledge as

resources for learning. Teachers understand that through dialogic practices they can position themselves alongside students, in order to transform the world, rather than transform the students themselves (Lawrence 2011, p. 33).

It is from this additive, kaupapa Maori foundation, within the context of whanaungatanga and through social co-construction, that school leaders have designed and implemented professional development to promote the new shared vision and aligned goals. At Invercargill Middle School, whanaungatanga-based relationships are evident in the clear, consistent, responsive co-construction of expectations and routines. The expectations and procedures for weekly teacher professional development is an example of this. The focus for each meeting is preplanned by leaders and teachers, on a shared document one term in advance. The selected development foci are based on teacher and student needs, gathered from observation feedback and co-constructed next steps. Initially the meetings were planned and delivered by the school leaders; however, as teacher confidence grew and adaptive expertise developed in classrooms, the meetings began to follow a leadership model that distributes responsibility across the team. The development of internal expertise is prioritized.

Active participation is an expectation and scaffolding is provided to ensure this happens. The agenda is set a week in advance and now follows an expected pattern which includes purposeful professional reading and reflection. This ensures every team member comes to the meeting from a position of *mauri* (innate worthiness), and through more equitable power relations, they take responsibility for adding to their own learning and the learning of others. Throughout the professional development, acts of dialogism, which “assumes knowledge is something people do together rather than an individual possession” (Lyle 2008, p. 225), are enacted. Culturally responsive practices are another key aspect, as leaders pay careful attention to the discussions, to student achievement data and observed outcomes in order to provide readings and contexts that will meet teachers’ future learning needs.

The timetabled observations and data sharing meetings are another key aspect to reforming pedagogy within the school. Initially the deputy principal modeled and was observed by every staff member following prenegotiated protocols and procedures. The lesson observation form was co-constructed by reflecting on aspects of the teacher registration criteria, the *Te Kotahitanga* effective teaching profile (Bishop et al. 2014a), the school’s values and students’ voices. The observation timetable that emerged follows a set pattern and is planned each term in advance. Teachers are observed regularly, and they observe each other. This is further reflective of *ako*, as educators are both learners and teachers within this process. Teachers have opportunities to request observations in order to be in control of their own development, including using videoed lessons which are then viewed during the co-construction process. Teachers watching their own lessons (on video) can reflect on their use of questioning and types of conversations in the classrooms through structured self-reflection practices. Observation practices such as these have built the impetus and agency for changes in their own practice and in the practice of others.

Data sharing meetings are also timetabled three times each term. The data are gathered based on a co-constructed assessment timetable and the data are recorded

on co-constructed student progress graphs. These graphs are stored in a shared folder and are accessible to any staff member at all times. At the meetings, student progress and concerns are shared through critical dialogue that focuses teachers on their own agency and away from deficit theorizing. A student summary form is used to scaffold this discussion. The reliability and validity of data collection and analysis is also moderated through the use of videoed assessment procedures. Through this dialogue, teachers and leaders plan next learning steps and deliberate acts of teaching, for themselves and their students, and the focus for future staff development and observations is set.

By 2015, ERO had begun to see the beneficial influences of this work. In their report, ERO noted that:

Leaders share very strong beliefs about what effective teaching and learning looks like. Teachers work well together and are improvement focused. They have detailed guidelines as to what effective teaching should look like in this school. New teachers are very well supported. ERO observed well-embedded systems and practices to build and support the quality of teaching. These include:

- *detailed planning and purposeful resourcing for classroom learning,*
- *intentional professional learning and discussions,*
- *peer observations of teaching practice and helpful feedback,*
- *teachers reflecting on their practice,*
- *and a rigorous appraisal process. (ERO 2015)*

Cultural relationships and responsive practices have been applied to all aspects of school life. Contexts where power is shared and learners have the right to equity and self-determination are evidence of this (Berryman and Eley 2017a, b). Teachers have begun to spread these practices further through the active sharing of student achievement information with students and with whānau. Now lessons begin with students discussing their achievement levels, learning goals and next learning steps. Students have opportunities to question, request learning conferences, and seek feedback. Every student knows, understands, and can articulate their current achievement levels, learning goals, and next steps. The Māori metaphor of *poutama mātauranga*, the never-ending upward stairway pattern, representative of the ongoing nature of learning, is commonly discussed as students talk about “moving up the poutama.” This is also understood by their parents. In the 2016, ERO, Shared Values video, one parent commented:

A sense of urgency to want to keep climbing and not be left behind. They are all pushing each other up that poutama and for me that's what whakawhanaungatanga is about. (ERO video file 2016)

Research tells us that “one of the barriers to the implementation of dialogic teaching is the dominance of the teacher’s voice at the expense of students’ own meaning making voices” (Lyle 2008, p. 227). At Invercargill Middle School, the pedagogy and curriculum reforms have created contexts where teachers value students’ cultural

locatedness and their cultural knowledge and they now view these as resources for the basis for all learning. Therefore, one teacher reflected:

In order to connect and create whanaungatanga with the home, the first way is through the children, so if the child is going home and talking to them about their learning, the parent knows that their child is being valued. (ERO video file 2016)

Home and School

Ako is described as a reciprocal relationship for teaching and learning, within the context of the broader whānau, this affirms the innate value of all parties. Grounded in reciprocity, ako recognizes that the knowledge and experiences that both teachers and learners bring to the learning ensure that both parties can grow and benefit from the learning. Furthermore, ako recognizes that the learner and whānau must not be separated (MoE 2008).

At Invercargill Middle School students have regular opportunities to comment on their learning and share this with whānau through the use of weekly *reflection books* and *student led conferences*. Reflection books are journals which encompass evidence of student progress, assessment, and weekly goal setting and reflection. Student agency is evident as students set weekly goals and reflect on their learning, engagement, and next steps. This is undertaken every Friday across all year levels throughout the school. These books are shared with whānau each term, and whānau comment and respond to their child in writing, thus providing opportunities for the strengthening of home-school relationships. Student-led conferences are held annually. Students lead their parents around stations covering aspects of their learning. At each station they explain, describe, and model their learning by teaching their whānau the skills and strategies they have been working on, thus providing further sharing of expertise within the broader whānau. As stated by one of the teachers, these conferences are of shared importance to students, whānau, teachers, and leaders:

The student led conferences are completely run by the children. They bring their whānau in and they take them around the different learning stations and teach them something. The purpose is for the children to explain what they have been doing and show their family. (ERO video file 2016)

Recently the innovative use of Facebook and the Seesaw app have added to these interactions. Each class has their own Facebook page; teachers post photos, videos, and comments that encompass the learning taking place on a daily basis. This provides opportunities for discussion and celebration among wider whānau, with posts often being shared by whānau more widely across the country and the world.

Evidence of the impact of powerful home-school partnerships for improved achievement was identified by Hattie's (Hattie 2012) visible learning analysis, which reported that concurrent home and school interventions were three times more powerful than good teaching alone. As a consequence of students developing expertise in their own learning, parents and whānau could also understand what was

happening at the school and they become adept at explaining what this meant. For example, a parent described:

Student led conferences are not a tick-box conference, it is a true sense of my child knowing everything that is happening in the classroom. They really understand their work, they understand where they are at now and where they are trying to get to. (ERO video file 2016)

Specific expectations that link within the school community will be used to raise achievement are now explicit within the current school charter. Already, the impact of these innovations is being spread by parents, among them one who stated:

The school's use of Facebook for a school page and each class having their own Facebook page gets used in lots of different ways but reminds parents and children who are looking over their shoulder at what's happening. . . there is a clear emphasis on showing the learning and recognizing achievement. (ERO video file 2016)

Oral Language

Another innovation that the school is using to improve students' learning and sharing with their home communities is that of oral language. Dr. Rangimarie Pere (1991) describes traditional Māori learning as understanding that every person is a learner from the time they are conceived to the time they die. Because everyone is in a constant state of learning and therefore teaching, the collective can also benefit through both the construction and the transmission of knowledge. In these endeavors, Pere describes language as the life line and sustaining force of culture. This is akin to the *whakataukī* (wise saying) *Te kai a te Rangatira, he kōrero* (the food of leaders is oratory) or with language our potential as leaders can grow.

Through professional learning discussions, students' oral language was identified as key to their accelerated progress in all aspects of their learning and leading. As a result, a new development focus for teaching and assessment practices began to emerge. Through regular classroom observations, reciprocal visits, and feedback meetings, the leadership team and teachers noted that many students were not actively participating in class or partner discussions, and when they did, they were asking questions that had already been answered. Furthermore, they were unable to summarize what had been said. Rather, the students were seeking affirmation and praise as opposed to sharing their ideas and opinions.

The literacy assessment data confirmed that needs in vocabulary and sentence structure impacted student achievement. The Deputy Principal attended the Language, Education and Diversity conference to further investigate additive language approaches. She connected with Associate Dean Pasifika Rae Si'ilata from the University of Auckland in regards to additive language acquisition strategies. On return she formulated a plan, applying the strategies of recasting and rephrasing, and together with the students in Room 4, she began the journey towards being active participants in their own and each other's learning. The class began to develop *talk*

moves that would empower students to participate more actively and in the end, run the class discussions. As the class developed their practices, they also created strategies and expectations for student ownership, empowerment, and active participation, rather than affirmation alone.

Soon, a whole school inquiry model was planned with the aim of developing more dialogic teaching practices and developing capability and adaptive expertise of all teachers in order to introduce these strategies into all classrooms and to increase the participation and ownership for all students. Dialogic teaching practices contrast with the view of behaviorists who see teaching as the passively received transmission of prepackaged knowledge (Lyle 2008). This transmission model is described by Freire as the *banking* model of education, whereby education is viewed as the transference of information and becomes an “exercise in dominance” (Freire 1972, p. 53). The co-construction and deliberate teaching of talk-moves and sentence stems provided students with the scaffolding to share ideas and questions and take responsibility for maintaining interdependent discussions. This required repositioning of the teacher from the center of learning to learning with and alongside the students. It was from this viewpoint that teachers established shared *talk moves* that would build, grow, and sustain the school culture of accelerated progress and reposition power relationships and responsibilities between teachers and students.

The oral language progress the students have made has enabled them to more richly describe their learning. In Room 4 the oral language development has impacted teaching and learning in te reo Māori, where the talk moves are being developed in te reo. The students began to use the talk moves to structure their writing, resulting in improved written language assessment results. Teachers noticed that the students started actively seeking out and using a greater range of vocabulary in their oral and written language – not just from their learning in class, but from things they encountered at home. The students were excited to share their vocabulary learning. As teachers focused on the ability to listen to and repeat back an idea using the talk move: “I heard you say” or “What he/she said was,” students became more actively engaged in listening because they knew they would be expected to repeat or comment on what was said. This flowed on into their writing – they were able to discuss their idea and successfully and confidently record it on the page. Teachers saw increased student confidence in the classroom – agreeing and disagreeing with each other’s ideas – using these silent signals, which also allowed them to constantly participate and show their engagement more actively. It also validated the opinions and ideas that the children were sharing in class as they received instant nonverbal feedback from their peers. The *talk moves* have given students confidence to have a voice, be heard, and to experience success, as themselves.

The oral language teaching and learning developments at Invercargill Middle School were being further accelerated through home-school relationships. Students shared their new vocabulary, silent signals, and talk moves at home and brought words from home to share at school. This process exemplifies: *whanaungatanga* which builds as learners’ participation increases and their voices are heard by others; *manaakitanga* which develops as learners work together, and with their parents, to support each other; and *ako*, as all take on the roles and responsibilities of teacher

and learner, building teacher capability as much as learner capability. The impact in teaching practice can be summed up by this sentence from a teacher:

I can't imagine teaching without the talk moves now. (PM Awards Application 2017)

In 2016

By 2016, rather than being seen as a school that was not performing, the school was invited to be one of the schools from throughout New Zealand to be filmed to exemplify ERO's new Evaluation framework indicators. In part, this invitation was undoubtedly due to the ERO evaluation that the school received in 2015 when, in their report to the school, the ERO reviewers noted:

Since the last ERO review in 2012 the school has responded to parents' wishes for Māori language learning. A level 3 bilingual class has been established. Māori and non-Māori students enjoy this class.

The school has continued to build on the good progress noted in the last ERO 2012 report.

This includes:

- *a strong focus and very effective systems to accelerate students' progress,*
- *comprehensive curriculum planning,*
- *high-quality teaching and learning,*
- *continued effective leadership,*
- *and, the development and use of useful review processes.* (ERO 2015)

Furthermore, ERO observed that:

Teachers skilfully use their in-depth understanding of each child's progress in reading, writing and mathematics to inform their day-to-day teaching and to support individual students in their classroom learning. Teachers work hard to ensure students understand their learning, know how well they are achieving and what they need to do to improve. (ERO 2015)

And finally, using the voice of a senior student, the ERO reviewers showed in their report that what teachers were doing in their classrooms was letting students know that teachers cared about their students' learning:

The board, leaders and teachers have worked hard to create a caring, inclusive school culture. The school values of respect and responsibility and its vision (e tu atu nei – stand tall, be proud) are very evident. There are high expectations for learning and behavior. Senior students told ERO 'teachers care about our learning'. One current school focus is to strengthen the home-school partnership and establish community links to raise student achievement. (ERO 2015)

The accelerated progress that emerged from the development of strong cultural relationships and responsiveness to students and their home communities was

encapsulated within the voices of the schools' students and whānau throughout this filming. For example, one parent stated:

...they're [the students'] given the space to be creative and they're given the trust that they're doing what they're supposed to be doing, and they thrive within that environment so you know, it works because they're known as individuals. Each know, the teacher knows them, like knows the children really well, and knows their likes and their dislikes and she targets them to where they're at, and where they need to go.

Another stated:

They [the school] really encourage them [the students] to know who they are, Ko wai au? Who am I? Where do I come from? Who do I belong to? So, in terms of their learning they always know where they are at. (ERO video file 2016)

Teachers also expressed their changed expectations about teaching and learning, one saying:

Our children know that they are going to achieve today. Our children know that they are coming to school to learn, we have these high expectations of them and they have high expectations of themselves and we have high expectations of each other. (ERO video file 2016)

Shifts in Student Achievement

Overall achievement, as shown in Table 1 below, a comparison between the 2011 and 2015 National Standards data showed that indeed, as a result of the schoolwide reforms, improvements in core areas of the curriculum had been achieved for both, all students and as seen by the disaggregated data in the columns alongside, for Māori students.

A finer grained analysis across the student cohorts, room-by-room, showed that achievement for Māori students was significantly higher in the Reo Rua class, established in 2013. A comparison of students across the classrooms by age revealed that for reading, similar aged students in the rest of the school progressed on average, 9.8 stages over the 3-year period, while students in the whānau class progressed on average, 14.33 stages. This was further evidenced in writing where similar aged students in the rest of the school progressed on average, 2.1 stages over the 3-year period, while students in the whānau class progressed on average, 7.5 stages.

Spreading the Culture

The academic success of the Invercargill Middle School whānau class has driven the desire from parents at other schools to have the opportunity for te reo Māori provision for their own children. As a result, the principal has now established a

Table 1 Comparison between the 2011 and 2016 National Standards data

	All students at or above the expected National standards		Māori at or above the expected National standards	
	2011 (%)	2015 (%)	2011 (%)	2015 (%)
Reading	79	86	79	84
Writing	58	82	50	89
Math	80	85	79	89

Māori Provision focus as a recurring item on the agenda of every Invercargill Primary Principal's meeting. Further, this group has now set a long-term goal of effective Māori educational provision across the city. This initiative remains on-going, and the plan is for this to be a long-term initiative that gives voice to the *Runaka* (local tribal leadership council) and develops collaboration in order to strengthen Māori provision in other schools. At these meetings, each school reports on what the school is doing to improve Māori outcomes. An Invercargill wide survey was conducted and a subsequent forum emerged, with the main focus being on the new Education Review Office indicators framework (ERO 2014), which now also focus on whanaungatanga, ako, manaakitanga, and mahi tahi, as levers for school reform.

School Success

Building and maintaining reciprocal whanaungatanga-based relationships has been a key focus at Invercargill Middle School since 2011. By 2017, the School Charter goal states:

All learners will be actively involved in their education taking responsibility and ownership of their progress. Learners receive regular feedback and use this to develop learning goals and they become experts in their learning, being able to articulate and report on their learning. (School Charter 2017)

School leaders have transformed the school culture to one that is now built on: whanaungatanga – through learning collaboratively towards a shared and aligned vision and goals; using ako – reciprocal teaching and active learning for teachers and students; and manaakitanga – as learning by empowering and supporting others. Using a kaupapa Māori approach as the basis of these transformations has reformed the school at all levels and seen impressive shifts in students' learning and achievement outcomes.

These results prompted the school to write and submit proposals for the New Zealand, Prime Minister's Award for Excellence in Teaching and Learning in 2016, and then again, in 2017. Each time the school was selected as one of three national finalists. As with this chapter, these proposals were based on the ways in which the school leadership team and teachers had applied a kaupapa Māori

approach to enable comprehensive school reform, thus resulting in increased and accelerated student achievement. Leaders provided a whanaungatanga-based framework alongside Ka Hikitia and used aspects of culturally responsive practice (Bishop et al. 2014b; MoE 2011) and historical and ongoing student outcomes, from which to change both the *positioning and skills* of teachers. Teachers were then supported to build new relationships and plan for *strategies and interactions* that would engage their students and whānau more effectively in their classrooms. As well, the school received advice from Māori community members. In turn, the *experiences* of Maori students began to change in ways that ensured they were able to enjoy and achieve education success as Maori. As a result, whānau also wanted to engage more regularly with the school and all other students also improved.

The results have enabled staff to inquire into their own teaching practices using evidence-based perspectives and from positions of honesty and openness aimed at equity. Leaders and teachers have maximized opportunities for ako by ensuring that their core community, school, and classroom work is paying careful attention to the incorporation and interrelationship of three discrete contexts (Berryman and Eley 2017a, b). These contexts for teaching and learning begin with cultural relationships that are responsive to the students' prior cultural knowledge and experiences as the basis for sense-making and new learning. These contexts also involve the development of purposeful, deliberate professional acts of teaching with adaptive expertise. Finally, the school works together with ongoing and authentic whānau input. Working together across these contexts has begun to see excellence, equity, and belonging for all students in the school, Māori, Pākehā, and Tauīwi.

Conclusion

Invercargill Middle School provides clear evidence of indigenous leaders recognizing their critical role of disrupting and changing the status quo of Māori underachievement. The transformation of the school through an indigenous leadership lens demonstrates how the development of Mauri Ora for Māori students can also benefit non-Māori students.

This case concludes with the voice of the principal looking to the future:

We have some unique opportunities now to support other schools through the provision for Māori and immigrant learners and we want to develop these further as is part of our 100-year thinking, to leave a lasting legacy for our children, our school and our community, so that we can live our school haka.

At the 2017, gala dinner for the New Zealand, Prime Minister's Award for Excellence in Teaching and Learning the school was announced as first equal. The principal's acceptance was impressive as he stood and performed the school haka to the room full of political and educational dignitaries. Perhaps 1 day, if we have more schools like Invercargill Middle School and more Room 4s, we will all be able

to understand not only the power of his performance but also the power of these metaphors and words.

	<i>Awaken, be alert Stand staunch, grimace!</i>
<i>Te Puna Wai ora</i>	<i>Te Puna Wai Ora</i>
<i>E tu atu nei</i>	<i>Stands with Pride</i>
<i>E whai ana</i>	<i>that seeks knowledge</i>
<i>I te puna</i>	<i>in the well</i>
<i>O te mātauranga e</i>	<i>of education</i>
<i>I aha ha</i>	<i>ahhh...rightfully so...</i>
<i>Kia tupu ake</i>	<i>that we grow</i>
<i>Ngā uri</i>	<i>the descendants</i>
<i>Waihotanga</i>	<i>to follow the footsteps</i>
<i>O ngā mātua</i>	<i>of our forefathers</i>
<i>Tūpuna e</i>	<i>Aha.. rtand tall in life</i>
<i>I aha ha</i>	<i>Move as one in education</i>
<i>Haramai te toki</i>	<i>Aha...stand tall in life</i>
<i>Haumie, huie, taiki e</i>	<i>Move as one in knowledge</i>
	<i>How great is the adze in education</i>
	<i>Ana, bind together all as one</i>

Abstract

This chapter will highlight some of the challenges and opportunities specific to bringing Indigenous knowledge and perspectives to online learning environments. Drawing on two recent Indigenous education case studies – the author’s experience developing a massive open online course (MOOC) on Indigenous worldviews and codesigning an online course for principals working in First Nations schools across Canada – this chapter will discuss the opportunities and challenges of designing online learning experiences that invite all learners to engage with Indigenous knowledges, worldviews, and pedagogies in culturally appropriate, respectful, and meaningful ways. This research is based on a

decolonizing theoretical framework using a critical pedagogical and relational approach to processes of knowledge production, informed by Indigenous research methodologies and epistemological frameworks. Applying an Indigenous ethics derived from Indigenous knowledge protocols in both the course design and the subsequent analysis of data drawn from evaluations of the course, the chapter argues that indigenizing online learning spaces is possible but also fraught with the same challenges of any learning space not of our own making.

Keywords

Indigenous education · Online learning · MOOC · Indigenous knowledge · First Nations schools · Principals · Indigenizing · Decolonizing

Introduction

This research is based on a decolonizing theoretical framework (Smith 1999) situated within action research, which I will discuss more fully below. It was inspired by the many Indigenous researchers who are “making the road by walking,” reframing our traditions to create respectful and relevant ways of doing research as ceremony. In writing this chapter, I referred to notes from our planning meetings; notes and emails from the design team meetings; feedback from our FNSPC expert advisory panel; and unsolicited feedback from our MOOC participants in the form of letters, emails, and postings on the course forums, and from two exit surveys distributed to the MOOC participants, one for those receiving a certificate of completion and one for those who were ineligible for certificates (meaning, they had not completed enough required assignments in the course). All these sources of data helped me to tell the story of how we attempted to Indigenize online learning in two very different types of courses: a MOOC scalable for thousands of learners across the globe over a few weeks and a small private online course of 10 months intended for no more than 20 learners from across Canada in each offering.

This chapter examines the opportunities and limitations of bringing Indigenous knowledge, perspectives, and education to online learning environments. Looking at two contexts of online learning, a massive open online course (MOOC) in Aboriginal Worldviews and Education and a small private online course for principals working in First Nations schools in Canada, it also includes discussion of how to design e-learning opportunities that invite all learners to engage with Indigenous knowledges, worldviews, and pedagogies in culturally appropriate, respectful, and meaningful ways. Situating our course design in Indigenous principles of respect, relevance, responsibility, and reciprocity, it is only fitting to extend these values to an analysis of how well the online spaces described here could be indigenized.

I begin with an overview of the two courses. While differing greatly in scale, openness, and cost, by the nature of their online mode of delivery, both courses share many fascinating similarities. In most instances, the challenges and opportunities of bringing Indigenous education to both online mediums are shared. The chapter begins with an overview and background of the MOOC and the First Nations

Schools' Principals Course (FNSPC) and then moves to a description of the overarching theoretical assumptions guiding the research project, the data sources utilized to answer the questions, and the ways that the data demonstrate the challenges and opportunities of introducing Indigenous knowledge in online learning environments.

Before moving on, it's important to clarify the terms I will use in this chapter. I understand "Indigenous education" to mean learning throughout the life course that is shared and draws from the accumulated knowledge and wisdom of Indigenous communities. While this definition is broad enough to include schooling, it is by no means limited to formal education. Indeed, traditional Indigenous education would likely be very much the *opposite* of the characteristics of many mainstream schools today which are based around age and subject segregation, bureaucratic authority, disciplinary power, routines, schedules, and separation from family, community, and adult work. In Indigenous education, learning takes place in the community and the environment, and everyone is a potential teacher from family members to nonhuman and more-than-human relations. Indigenous education as it is talked about today usually includes schooling that has an element of culturalism for self-determination or anticolonialism for building solidarity among non-Indigenous learners. I situate the online learning strategies of our research projects as emerging both from within and against these notions of education. Indigenous education can include the transmission of Indigenous knowledge to either an Indigenous or a non-Indigenous learner.

Indigenous knowledge is defined by UNESCO (2017) as the understandings, skills, and philosophies developed by societies with long histories of interaction with their natural surroundings. Battiste and Henderson (2000) add that these are systems. One part is not easily extricated from the whole without changing its nature. Castellano (2000) talks about systems of Indigenous knowledge as having three sources, traditional, empirical, and revealed, as well as five characteristics that include being experiential, holistic, personal, orally transmitted, and using narrative and metaphor. While I believe that Indigenous knowledge is part of the knowledge we've brought to bear in designing curriculum for these courses, it is also not the only system or tradition we've drawn from in creating these courses. From a purist perspective, we cannot exchange exclusively Indigenous knowledge in cyberspace; it is a hybrid way of working, not unlike the "ethical space" or "third space" notions of thinkers such as Willie Ermine (2007) or Homi Bhabha (1994). Indigenous knowledge brought to online spaces is usually compartmentalized into individual teachings, which, while discrete and workable independently, still refer and relate to all other teachings (to a person knowledgeable within the culture). These pathways and connections are not necessarily accessible or shared in these spaces – often for good reasons. Additionally, pragmatically it takes a lifetime to learn the intricate connections and cycles linking knowledge together. Often, the safest and most accessible aspects of Indigenous knowledge are what find their way into online learning. Deeper knowledge would require greater experience and connection to knowing, and that apprentices of the knowledge form relationships with the knowledge keepers in person in order to yield a meaningful exchange. So, when we talk about Indigenous knowledge online, it is usually in reference to a particular kind of Indigenous knowledge that is more introductory, will not bring harm on others if

shared again, and is able to work in a relatively low-context communication exchange.

In traditional Indigenous education, value is placed on teaching and learning from place and in high-context relationships (Hall 1976), where the teacher knows the learner intimately and can customize teaching to the pupil (Styres and Zinga 2013). In an online environment, place, relationships, and community building become virtual constructs, and communication is usually low-context, especially when the audience includes large groups, as is the case with MOOCs. Another characteristic of traditional Indigenous education is engagement with the whole person in developing spiritual, emotional, intellectual, and physical aspects of their being (Bopp et al. 1989; Cajete 1994). My research seeks to examine if online activities can contribute to these aspects of learning, identified by some as the core of Indigenous education.

This chapter draws from research into two online courses that I played a role in developing. The first was a MOOC entitled *Aboriginal Worldviews and Education*, which was offered on the Coursera platform in early 2013. The second was a small private online course run by the Ontario Institute for Studies in Education (OISE) of the University of Toronto in partnership with the Martin Family Initiative – a partnership that is detailed later in this chapter. The design teams on these courses formed a research partnership to glean lessons learned, and this chapter is a distillation of emergent findings from our work.

Our research is guided by these questions:

- What are the opportunities and limitations of bringing Indigenous knowledge, perspectives, and education to online learning environments?
- How can we design e-learning opportunities that invite all learners to engage with Indigenous knowledges, worldviews, and pedagogies in culturally appropriate, respectful, and meaningful ways?

Theoretical Framework

This research is based on a decolonizing theoretical framework (Smith 1999), using a critical pedagogical and relational approach to processes of knowledge production, informed by Indigenous research methodologies and epistemological frameworks (Debassige 2010; Kitchen and Raynor 2013; Kovach 2009; Restoule et al. 2008; Restoule 2011; Wilson 2008). Our research framework is situated within action research, an appropriate methodology, given our focus on actively developing educator capacity and leadership (Kitchen and Raynor 2013). Action research is “. . .collaborative, inclusive research with the objective of action resulting in the promotion of social change” (McDavid et al. 2013). Further, we are committed to work that is Indigenous community-first, land-centered, culturally aligned, relevant, and based on respectful relationships (Styres and Zinga 2013; Zinga and Styres 2013).

As researchers working in Indigenous contexts, we were inspired by the work of Shawn Wilson (2008) and Linda Smith (1999). We have approached research as

ceremony (Wilson 2008) with a focus on relationships, as we agree with Wilson (2008) that reality is composed of our relationships and essentially form who and what we are and what we can know. Within our course design and our research, we seek to inspire learning and coming to know through the fostering of relationships and studying the relationships and networks that have formed as a result. In *Decolonizing Methodologies*, Smith (1999) identified 25 projects of anticolonial research: our partnership incorporates several of these, some of the more obvious fits being indigenizing (project 6), connecting (project 9), representing (project 12), and reframing (project 15). We hope that by engaging in this work, we study how our course designs have inspired greater indigenization, connecting, representing, and reframing Indigenous identities, rights, knowing, and realities, and actively contribute to these processes through the partnership's practices themselves. One of the Elders we consulted said that we walk the walk not just talk the talk and that our path for the next ones coming is the one that we make today. In other words, "we make the road by walking" (Horton and Freire 1990). It is this symbiotic relationship between research and practice that we aspire to enact and enable through our work.

Creating the First MOOC on Aboriginal Worldviews and Education

Offered in early 2013, the Aboriginal Worldviews and Education MOOC attracted 23,000 initial registrants from around the world. Several thousand more have taken the course in its archived form since, and, in 2017, the course was modified for on-demand mode attracting 2000 more learners in its first month. In its inaugural offering, our completion rate was triple the average for MOOCs (13% vs. 4%) (Jordan 2015), showing a high level of engagement and interest sustained among course participants, a result our team worked hard to achieve.

In the span of just a few years, MOOCs have gone from relative obscurity to being touted as the most important recent innovation in higher education. Taking apart the acronym allows us to see how they differ from conventional distance learning. "Massive" refers to enrolment numbers, typically in the thousands or tens of thousands. "Open" refers to the price tag of enrolment: completely free to anyone with access to broadband Internet, which also depicts the "Online" part. The course content is available through the Internet, usually at the users' convenience and usually without a synchronous "real-time" participation component. The "Course" part is that a MOOC covers standard course material delivered by a course instructor or small team of instructors over several weeks, with assignments and quizzes to assist in the absorption of course content. These assignments are often machine-graded or assessed by course peers. Following the course, one may obtain a certificate of completion or in some cases, and for a fee, receive course credit toward a university degree.

The MOOC I designed required no previous knowledge or prerequisite courses, only an interest in learning about Indigenous history and worldviews. The "About the Course" section on Coursera described the course:

Intended for both Aboriginal and non-Aboriginal learners, this course will explore Indigenous ways of knowing and how they can benefit all students. Topics include historical, social, and political issues in Aboriginal education; terminology; cultural, spiritual and philosophical themes in Aboriginal worldviews; and how Aboriginal worldviews can inform professional programs and practices, including but not limited to the field of education. (Coursera 2012)

For each week of the course, there was a different topic with several short videos that delivered the course content (5–20 min each) featuring the instructor (me or sometimes a guest lecturer). Some of these videos included one or two integrated quiz questions. “Adequate participation” in the discussion forums was defined as a minimum of ten posts and ten comments on others’ posts, which was worth 10% of participants’ final grade. There were also two graded quizzes each worth 20% of the course grade and the peer-assessed assignment, worth 50% of the final mark. This assignment grade was only accepted if the participant had assessed three of their peers’ assignments as well, again encouraging learners to learn from one another’s knowledge and use their own expertise to enhance the experience of their course peers. The course also included optional activities that could be completed independently or through the forums, but these were voluntary and did not count toward the final grade. The videos had subtitles in numerous languages, and additional accommodations, if needed. The quiz due dates were overlapping in case some students had more time in one section of the week than the other and remained open past the end date for more learners to take advantage of the content by watching the video lectures, reading the suggested articles, and surveying and possibly contributing to the forum discussions.

The primary mode of organization in the Coursera platform is the video lecture. These act as the main content or anchor funneling the student to the assigned readings and resources.

Discussion forums, a key component of each course, enable students to interact with each other about course material. Aboriginal Worldviews and Education featured video lectures released on a weekly basis and related resources tied to each video, such as additional readings, video screenings, and websites. Each week about 10 videos were released with approximately 2–3 h of content in total per week. There were three optional nongraded activities that were designed to encourage forum participation on key topics. Video lectures and “screenside chats” also encouraged students to make comments about the lecture material in the forums.

The findings in this chapter from the MOOC study are based on an exit survey completed by 2,500 people, as well as the in-course statistics that Coursera captures. The results of two post-course surveys sent out to participants were also examined to gain a better understanding of participant engagement. Importantly, one survey was for learners who did not complete the course, and the other was sent to learners who did.

Having discussed the MOOC background, I will now turn attention to the FNSPC, a small private online course, and will then detail the similar challenges and opportunities available to us when bringing Indigenous knowledge into these e-learning contexts.

Designing a Pilot Course for Principals in First Nations Schools

In early 2014, the Martin Family Initiative (formerly the Martin Aboriginal Education Initiative) entered into a partnership with OISE to design and pilot a primarily online course for principals working in First Nations schools in Canada. A number of agencies funded the development of the course, and XX volunteer advisors, all experts in the field of Indigenous education in Canada, were consulted during the development and pilot process. The reason behind creating the FNSPC is that research has shown “leadership not only matters: it is second only to teaching among school-related factors in its impact on student learning” (Leithwood et al. 2004). In a survey of best practices and high performing schools, Bell (2004) and Fulford and Daigle (2007) found a common theme: effective educational leaders led to successful students and schools. As Bell (2004) noted:

Successful schools are led by capable and caring principals and energized by teachers and the instructional and student assessment practices they employ. The quality of their training, their depth of experience and knowledge of subject matter; their expectations, their ability to form positive relationships and their cultural understanding of their students and communities positively affect students’ performance and behaviour.

A design team from OISE met with a 22-member Expert Advisory Panel of leading educational thinkers, planners, principals, and academics in regions across Canada on two occasions before launching the pilot course. The first meeting helped establish the content that had to be included and preferred activities, design features, values, and resources. The design team then created a 200-h, 10-month course for review by the Expert Advisory Panel. During this second meeting, the panel evaluated the flow, amount of information, type of resources, and scale of activities. The design team then produced a beta version of the course which the panel reviewed virtually. The pilot course was then offered from September 2015 to June 2016.

The FNSPC has now been offered twice in addition to the pilot. Based on the experiences of those involved in the FNSPC, the research aims to gather perspectives and insights as to what works or doesn’t when transferring Indigenous knowledge and perspectives to online spaces, for whom, and why. Participants and design team members from the piloted and subsequent year of the course, the MFI team, and the Expert Advisory Panel have all contributed valuable data to the research study, which is important for furthering understandings of Indigenous education.

Indigenous communities have consistently called for meaningful recognition of Indigenous worldviews and ways of knowing in school curricula and community learning (Canadian Council on Learning 2009; Kanu 2011; Paquette and Fallon 2010; Royal Commission on Aboriginal Peoples 1996; Wilson and Wilson 2008). In our design of a course for educational leaders working in First Nations schools, we sought to improve general knowledge of Indigenous worldviews, history, and perspectives and thereby foster increased understanding and build meaningful cross-cultural relationships.

In answering our overarching research question, regarding the opportunities and limitations of bringing Indigenous knowledge, perspectives, and education to online learning environments, the data from the FNSPC analysis came from three sources. These sources included exit interviews and surveys of the 21 pilot course participants, as well as comments from the national Expert Advisory Panel, who provided extensive feedback during a 3-day intensive meeting and course closing in June 2016. I also draw from evaluation forms for both the panel and the course participants that were collected by the course coordinator, which allowed completers to submit anonymous comments.

Opportunities of Bringing Indigenous Perspectives and Education to Online Learning

Although the MOOC and the FNSPC are ultimately quite different, the opportunities that each provides for Indigenous education were remarkably similar. Further, many of the opportunities found are in line with the literature on the advantages of online or distance education, namely, greater accessibility, flexibility, access to experts and diverse perspectives, and the opportunity to mobilize action and form communities of practice. Proponents of MOOCs have also noted the low cost for participants as a key plus. The literature on online learning identifies the following challenges: loss of context and place-based meaning in the main lectures, loss of control over how information is used, and the typical issues with technical problems, such as learning curves related to adopting new technology and the loss of community and real-time interactivity when communicating through computers. It's common in the literature on best practices in online learning to find that online modes of delivery is best suited for learners who are highly self-motivated and have strong time management skills.

Among online learning options, the MOOC has at least two features that are distinct: scalability and lack of course fees. Unlike conventional online course offerings, MOOCs are designed to scale up to support an indefinite number of participants. Accordingly, course design platforms and considerations must take into account the potentially global reach and the widely divergent starting points of course participants vis-à-vis knowledge and experience. The lack of course fees means that the course is open to all students. Accordingly, many enroll and may have little intention or motivation to complete the course. Completion rates for MOOCs are estimated to be 4–5%. However, as Balch (2013) notes: “MOOC completion rates aren't really low in the context of Internet engagement. A click through rate of 5% for a Google ad is considered a strong success. Convincing 5% to engage intellectually for 8 weeks is, I think, a big deal.”

The two features detailed above are likely behind much of the hype (and backlash) associated with MOOCs. MOOCs have variously been called the end of higher education as we know it and the realization of extending education as a fundamental human right to everyone. The potential of MOOCs in terms of scale, reach, and size contributes to the democratization of learning from an optimistic standpoint and potentially entrenches the cultural imperialism of higher education

from a critical perspective. The scalability is what gives MOOCs such global reach, accessibility, and cost savings over time and per capita. However, the scalability is what may also attract investors to for-profit MOOC ventures. MOOCs in a capitalist environment will ultimately influence accessibility. The largest and most well-known MOOC providers are currently highly reliant on the prestige of the universities they partner with. In essence, to draw students to the courses, they are using the brands and prestige that the names of world-leading higher education institutions provide. Koller's Ted Talk (2012) often references the "top-tier" education available through Coursera's partnerships.

The high-quality free course offerings are the main appeal of the MOOC to those who sign up. Peterson (2012) states that there is one word that matters more than any others in assessing MOOCs:

That word is "free." MOOCs can provide the liberty to learn as adults so often must. Without relocating. Without reorienting. Without unpaid, unpayable debt. If MOOCs can simply educate adults for zero cost as well as the expensive for-profit colleges upon which people presently rely, then their admittedly imperfect enterprise will still do real good in the world by chasing real evil from it.

Presciently, Peterson (2012) sees MOOCs as challenging not higher education institutions in general nor even the prestigious universities being courted by the various MOOC platforms. The real threat is to the many for-profit institutions currently offering online education opportunities marketed to adult professionals who can't afford the time, money, or space to attend the renowned brick and mortar schools.

At the time of this writing, Coursera is the largest MOOC provider, with 23 million registered users (Shah 2016). A social entrepreneurship company founded by two Stanford University computer scientists, the company partners with well-known universities, such as Stanford, Michigan, Princeton, UPenn, Duke, and the University of Toronto, to deliver courses online. For Coursera, instructors videotape their lectures in advance and upload them for captioning and transcribing, a service that increases accessibility, especially for a global audience. This can take a few days, which is one reason why producing content ahead of scheduled release dates is important. In some regions, students have to travel to an Internet provider, download the content onto a hard drive or memory stick, take it home to absorb, and return to the ISP to post questions and comments or submit assignments. To have to "attend" class in real time is not possible.

Personally, I struggled with having to produce the majority of the content ahead of the course offering. A key component to teaching in an Indigenous way is interactivity, responsiveness to the particular group and its needs, reading the feeling of the group and responding accordingly. I wanted to avoid what Freire called the "banking concept" of education where students are passive recipients of content. As Sumner (2000) states, "one-way technologies leave little room for communication in the true sense of the term – communication as emancipative, non-dominative discourse designed to promote understanding" (p. 279). I began to ask myself,

how could I engage students in the meaningful dialogues that are fundamental to Indigenous ways of teaching? In classroom teaching I prioritize and center on both narrative and storytelling. How might I apply Freire's notion of conscientization (Freire 1973) to this course and contribute to social change?

Using transformative learning as a conceptual framework, I sought to find ways to bring a more reflective and critical discourse to the MOOC. Merriam et al. (2007) assert that "Transformational Learning is about change, dramatic, fundamental change in the way we see ourselves and the world in which we live" (p. 123). Imel (1998) states that teachers should foster a learning environment of trust and care and that students should share the responsibility for establishing a learning atmosphere whereby "transformative learning can occur" (p. 4). Working with a team of graduate assistants, we began to actively seek ways to create an online space in which people felt comfortable and safe to share their personal experiences and stories with the desire to catalyze personal change in the lives of those taking the course, spurring the learners on to take action in their lives to contribute to social change in how Indigenous peoples are treated.

Mainly, the data identify a series of paradoxes about learning online. On the one hand, you can access experts and knowledge keepers who might never visit the community in person; on the other, your opportunities for immediate interaction with those people are severely limited (outside of a webinar format). On the one hand, you can connect with a community of people from across vast geographies; on the other hand, it's rarely synchronous, and often there's a lag between sharing a message, journal entry, or post to a forum and receiving a reply from others. One has access to a community of like-minded practitioners and learners; but this community is geographically distant and not often online at the same time, nor available for quick chats in the hallway after class. On the one hand, technology enables these possibilities; on the other hand, it frustrates users to the point of disengaging, feeling inconvenienced by learning new programs, or having them work inadequately.

Translating Indigenous Education to an Online Environment

One characteristic of Indigenous education is seeking ways to engage the whole person in developing spiritual, emotional, intellectual, and physical aspects of their being. Using a medicine wheel as organizational principle, our MOOC course activities sought to focus on these different aspects of being.

Activity 1 asked participants to describe a place that has special meaning to them. Many people interpreted this icebreaker as a spiritual question. Indeed, there is an intuitive aspect to the question that engages students in describing why a place draws them to it. Activity 2 involved writing a response to what it feels like to experience loss of life and knowledge. Students complete a list of ten names all of which have taught them something valuable. They are then directed to strike off a name one by one until only one name is remaining. In the debrief students learn that in some regions 90% of the North American Indigenous population was killed by disease, warfare, and other means over the course of a few generations. What is the impact on

knowledge and learning and cultural worldview? This activity had an emotional component. Another activity had students analyzing a segment of discourse from Canadian Prime Minister Stephen Harper's Indian Residential Schools Apology of 2008. It was largely an intellectual exercise. The peer assessment assignment required creativity as students used ethnographic writing to describe with detachment and cultural insight, an event or location that is familiar to them.

The open online platform offered great opportunities for diverse voices and media to be shared as part of the content. Available open-source material is vast, and selecting the right video, resource, or reading became tricky. I incorporated videos from Indigenous Elders and community members to provide a diversity of voices. The online platform proved particularly helpful in this regard as we were able to hear from a broad range of Indigenous scholars, thinkers, and activists. The response from course participants demonstrated the effectivity of this approach, exemplified by the following excerpt:

Dr. Restoule's MOOC uses the Internet to provide links to highly relevant materials that provide the essence of the course. These materials include more than 90 hyperlinks to relevant professional articles, Government Reports, United Nations' Documents, interviews of other departmental faculty members and graduate students, segments from interviews by other professionals, talks given at professional conferences, blogs, YouTube videos, interactive graphics, historical footage, short films, tours of significant museums, photographs of other locations, stories of Indigenous people and even access to 4 hours of CBC programing. (Canadian equivalent to PBS programs). Something that would be impossible to provide in a classroom setting.

The feel is something entirely new to me. ... Dr. Restoule, provides something more like a docent in a museum tour. He exposes you to a wide range of material about which he is very knowledgeable, and draws your attention to things you might otherwise have missed while keeping the tour group moving along. While you may not actually visit the museum again, you know that if you do go back, what objects you like to look at in more detail.

A different participant responded to our approach and also touched on another goal in the course design: to encourage students to take up their own learning long after the course was complete:

i've just been ruminating on this the entire time. ... the way the teaching in this class really has been different from my other experiences in Coursera and classes in general. i really felt like a great effort was made to give us lots of different KINDS of resources, to get us to think on our own, investigate and ponder on our own, imagine, understand, create. this is the only class out of several i've taken on Coursera where there were so many additional resources of all kinds, where there was such a creative kind of essay assignment, and where the lectures themselves seemed to wrap throughout just like a medicine wheel. in other words, we learned about the content just by being a part of the class!

A key focus of our course design efforts was to ensure the forums would be used often as a place for deep discussion and dialogue, just as in a face-to-face Indigenous education class. The discussion forum in particular was helpful in creating a more "horizontal student-teacher relationship" (Taylor 1998, p. 18) and demonstrating how much students have to contribute to the learning environment. The online forum

was used by students to support one another and answer each other's questions. For Aboriginal Worldviews and Education, there were a total of 43,879 posts in the forums made by 4685 participants. There were 326,266 views of forum posts. These numbers lend credence to the idea of four student archetypes Hill (2013a) suggests: lurkers who read but don't post, passive participants who look at the material and do the assignments but don't participate in discussions or postings, active participants who engage with the material and their peers in numerous ways, and drop-ins, who become deeply involved in aspects of the course, subtopics that interest them, but do not attempt to complete the whole course.

In a sample pool of 500 randomly pulled participants of the course who filled out the demographic survey, Brugha and Restoule (2016) found that forum participation mostly met expectations, with a few interesting exceptions. For instance, countries where English is not the predominant language appeared to have a lower contribution rate to both posts and comments and had seemingly more discomfort with original posting than commenting. North Americans were more likely to post more than the required number of original posts, which could be because of their comfort with the language or perhaps even the course content. Males appeared more comfortable posting their own notes rather than commenting on others, whereas it was the opposite for women who were more likely to choose commenting rather than posting. Participants with less than a high school diploma did not comment on others' posts, whereas it proved to be the opposite for those who had a high school diploma as their highest level of education. Participants with a post-graduate degree appeared to like original posting, whereas participants with a completed post-secondary school degree chose commenting on others' posts more than creating their own.

The results of two post-course surveys ($n = 1656$) sent out to participants were also examined to gain a better understanding of participant engagement. One survey was for learners who did not complete the course, and the other was sent to learners who did. For the former survey, when they were asked what course components they found were most valuable in helping to learn the materials, most agreed on the video lectures (93%), related resources (89%), and quizzes (62%). Interaction with peers was agreed to be valuable to 41% of participants, and 39% stayed neutral on the subject, which could be because they did not use the forums. If they had used the forums, it is possible that they may have been more engaged and complete the course. As Saadatmand and Kumpulainen (2014) state, the nature of MOOCs requires students to assume active roles, in a spirit of openness, to shape activities and collaborate in goal achievement. Learners decide which tools and resources to use, which readings to master, and which connections to rely on. If they do not choose to participate in and learn from these connections, perhaps this results in less learning and achievement. This supports the theory that online learning favors self-motivated learners.

In the post-course surveys returned by learners who completed the course, 65% said that reading their peers' work helped enhance their understanding, and 57% agreed that forum discussions enhanced their understanding. Sixty-seven percent agreed forums were safe and supportive, and 55% agreed that forum

organization was conducive to communication with peers. Some of these numbers appear to disagree with the non-certificate track participants, but as mentioned before, this could be because they did not have an opportunity to participate as much in the forums.

The course data of Aboriginal Worldviews and Education indicated a direct relationship between forum contributions and grades achieved (however, this result may have been encouraged by 10% of the course grade being tied to forum contributions). While correlation does not imply causation, it should be noted that forum presence might be a larger contributor to achievement and dedication to course completion than previously estimated. The importance of creating a community is indicated throughout the literature as a predicate to engagement (Kop et al. 2011; Maddix 2013), and active participants have been noted as being the key to a successful MOOC (Milligan et al. 2013). These connections, however, must be supported by an effective pedagogy that supports and engages such a diverse group of learners (Ahn et al. 2013; Kop et al. 2011). This will allow them to engage with each other, learn from one another's experiences, and form lasting and effective learning connections.

Transformative Learning Potential

This goal of pushing the students to become responsible for their own learning harnessed the power of open sources and finding materials that are no cost and accessible online. Indeed, this is the core group MOOCs are targeting and hoping to pull into higher education:

I am so grateful that Dr. Restoule, the University of Toronto, and Coursera are sharing this information for free. Where I live, there are very few (if any) courses on Aboriginal/American Indians within a 50-mile radius. ...Also, at this point in my life, I can't afford to attend college courses (it's very expensive in the US – I'm still paying off my student loans from 1997!). Anyway, it would be a lot harder to learn about this topic without a free course like this.

We watched as students took learning into their own hands, creating Facebook study groups, in-person meet-ups, and a Twitter hashtag for the course so students could immediately share their thoughts on the course and their learning. Libraries reached out to explore ways of supporting MOOC learning in their spaces by hosting and facilitating meet-ups.

There is a notion that the learning process could continue after the course is over and that authentic networks of people interested in lifelong learning could be promoted. As the 4-week course progressed, we watched as this critical reflection became more substantial and students engaged in the notion of praxis, "moving back and forth in a critical way between reflecting and acting on the world" (Taylor 1998, p. 18). It was clear students were challenging themselves to think in a new and transformational way as in this example:

... The course also got me thinking much more critically about knowledge and goals for obtaining it - not acquiring units of categorizable information, but envisioning it as something deeply personal outside the bounds of an external authority. While I don't come from an Indigenous heritage, much of what we learned about knowledge struck me as intuitively "right" somehow.

We received multiple responses about the course moving participants to seek out Indigenous activist events. This kind of movement toward making critical social change as a result of what was learned in the course is the most dramatic example of transformative learning. There were other responses about being moved personally, being "changed" forever as a result of what was learned usually followed up with additional comments about ensuring others would learn about what the participant had learned. There were many responses about "decolonizing" oneself. The course brought people together to engage in more than intellectual learning. They were learning with their "whole selves."

Opportunities Embedded in the First Nations Schools Principals Course

With respect to the data shared from participants in the FNSPC, the opportunities provided by learning this material online were often similar to those expressed by MOOC participants. Characteristics that were named often included accessibility, flexibility, convenience, connecting to a community, and greater opportunity or access to diverse opinions and perspectives on both leadership development and working in a First Nations community.

As with many other aspects of the FNSPC, the ways in which these advantages are felt are nuanced by the use of Indigenous knowledge and the fact of the content being situated in First Nations contexts. For instance, where access is concerned, many of the First Nations schools are located in remote areas. In order for leadership development to remain relevant to the context the principals work in, a healthy foundation within local Indigenous knowledge needs to be fostered. While this quality cannot be transferred adequately on a national scale, we could and did design assignments to require each individual participant to make connections in their local community to enable exposure to the local knowledge ways and practices. This was a key design consideration so as to align with the diversity of First Nations demands an approach that favors the local and specific over a pan-native approach. We designed assignments to encourage principals to connect with the local community practices. As the participants and Expert Advisory Panel let us know, it was important to ensure no imposition of worldview and that the tone of the course should be respectful of the culture of the school and community where they are located [June 2016 meeting].

The flexibility of an online learning module allows the FNSPC participants to take the course at their own pace and at times that are more convenient for them. While this is true also of the MOOC experience, principals have demanding schedules with responsibilities that often make their daily timetables unpredictable.

Further, being able to access a course in a flexible manner allowed the principals to keep their regular work hours, maintaining their responsibility to First Nations Schools. By continuing to attend work, while studying professional development in their own time, the FNSPC was able to inspire through direct relevance: from what they study at night in the course to what they experience in the day at work. If they had needed to travel away from their school to access an in-class course, this opportunity would have been lost. Participants shared with us that they most preferred to work on the course on weekends and evenings. They also stated that going forward, the course should “make sure all activities/tasks are open/flexible enough for participants to adapt them to their circumstances.” At the same time, they cautioned us to maintain the rigor of the course, indeed, even to reduce some of the flexibility and choice within the assignments. As one group noted, “there shouldn’t be too much flexibility as timely collaboration and contribution is paramount to the success of the course.”

Principals expressed to us the loneliness of their profession, especially when they were working in First Nations communities. Rarely did they have opportunities to chat through challenges and experiences that come up as they must maintain a sense of neutrality among staff, parents, students, and other constituents in their daily activities. While respecting privacy and anonymity, principals cannot appear to be taking sides in conflicts, or debrief or discuss these encounters and leadership challenges with their peers, unless they have access to a network of other principals. For principals working in First Nations contexts, this loneliness can be heightened by the specificities of the role, remoteness of schools and communities, and the added challenges of being members of small and tightknit communities. An opportunity of bringing Indigenous knowledge to online learning was to enable and foster the development of relationships among principals in the course. In each other they found a supportive learning community and one who understood the unique challenges of working in a First Nations context.

The importance of networking with other principals was highlighted in the post-course evaluation focus groups and surveys. When asked how the Martin Family Initiative could continue to have impact on First Nations schools, all groups named the importance of establishing a network to link principals and schools via video-conference and email to discuss topics, such as best practices in educational leadership, where to access additional training, how to develop curriculum, and how to indigenize curriculum. Furthermore, the principals noted in their groups the importance of learning from someone with experience as a principal and as a teacher in First Nations schools. Every group mentioned that future facilitators must have First Nations school experience, even more important than academic qualifications, although several did note this as an important qualification. All groups underlined the importance of course facilitators understanding Indigenous languages and cultures, as well as understanding the difference between provincial schools and First Nations schools. Most groups, though not all, mentioned the importance of facilitation coming from a strong instructional leader.

Another identified opportunity for online learning in the FNSPC is the way more “experts” could be brought into the instruction of the course. By including videos,

we were able to draw from the expertise of the members of the Expert Advisory Panel and include their perspectives in the teaching of the course. Some of the most popular segments created for the course were on-site tours of a school with experienced principals and interactive interviews with expert principals drawn from our advisory panel. This expanded the possibilities of instruction and increased the number of perspectives on issues of importance. Indeed, these aspects of the course were so appreciated that all focus groups in June 2016 mentioned the desire for more guest speakers in future offerings. The groups identified topics where they desired guest speakers, in particular special education, as well as strategies for conflict mediation and resolution.

This access to diverse opinions was another key piece of using online learning tools. The principals had access to each other's opinions and also to diverse materials curated for the course curriculum. Since we tried to cut materials down to make the course less imposing or intimidating, there were many items, videos, and readings that became supplemental, yet were still accessible to the participants. It meant a wealth of opportunities for access to materials. Again, for some of the more remote communities, finding these items would not have been possible without the course. In our focus groups, the resources were universally lauded as excellent. The suggestions were limited to additional organization of the resources so that they could all be accessed from one spot (instead of only within the relevant modules) and a few additional resources designed specifically to build on material covered within the course. In addition, one group recommended a particular resource from their region, and another group suggested an additional video on the topic of managing classrooms.

Challenges of Online Learning

In the literature on online learning challenges, there are a number of themes that recurred in our analysis of the MOOC and FNSPC. These include technological issues, such as the learning curve associated with using new technologies, occasional inconveniences of connecting from remote locations, and other various technical issues. Aside from technology-related problems, there are the challenges of mediated communication, such as (not) feeling part of a community and delays in receiving feedback or responses that characterize asynchronous courses.

In online learning literature, the need for learners to have strong time management skills and self-motivation are often named as challenges. The pilot group of the FNSPC, however, was excellent in this regard. The only way they were challenged in this component of e-learning might have been with falling behind in the early days of the course. Usually, when you feel like you are behind more than a module, you start to just not log in at all. To avoid this potential challenge, our course coordinator had regular check-ins and would encourage those falling behind to just start at the module of the current month instead of progressing sequentially. Because our modules were not dependent on prior learning or scaffolding of concepts, it was possible to do this – to skip ahead without getting lost.

The motivation to log in to the FNSPC was challenged in the early days of the pilot because of a technical glitch with permissions to use software chosen for the course. It was in fact a glitch fairly unique to our cohort that had to do with timing of software releases, shared permissions, and institutional issues with our cohort's student statuses. While representative of the potential difficulties of relying on technology, this particular set of circumstances is highly unusual and unlikely to recur. With this bug sorted out by the release of module three, the tech challenges became more typical in nature: community broadband limiting video uploads and minor inconveniences related to videoconference feeds.

Where learning curves were concerned, the FNSPC participants found the EdX MOOC platform we used for the course intuitive and easy to work with. Our supporting solutions such as Seafile, a file sharing software, while easy to use and reliable, were missing some desired features such as notification when a file successfully uploaded. When participants received files, it was obvious, as they appeared in a folder created for the course, but when they submitted files to the instructor or other members of the cohort, it wasn't clear to the sender when or if the file had successfully transferred. At end of course, nearly all participants recommended additional supports for navigating the tech, including an in-person walkthrough of how to do day-to-day course functions. They greatly appreciated the tutorial videos created for the course and recommended a few more as well as making them easily accessible from the main page at login.

One of the interesting findings around the tech learning curve is that the principals reported using their phones for a LOT of the course. Therefore, a mobile app for the course would have been appreciated. Also, the majority of FNSPC participants used multiple devices and locations for participating in the course. Reasons ranged from finding quieter workspaces and being more comfortable (at home or in the office), to issues with firewalls and security, to device preferences. While the course was designed to be mostly asynchronous to allow principals the utmost freedom and flexibility to choose when to participate, an interesting recommendation emerging at the end of the course was to have more videoconferencing opportunities (at least monthly) and to schedule them at set times from the beginning of the course so that they could be scheduled and planned for well in advance. The desire to interact in real time with colleagues was the motivating factor behind this recommendation. It should be noted that the Vidy software we used in the course actually enabled participants to contact any one of their cohort members at any time and use a private chat room to connect. It seemed the interactivity that real-time video conference sessions afforded the principals helped to counteract lack of motivation and provide support.

A challenge of online learning is that participants don't always get immediate responses from instructors or other participants. There can be a lag in communication that makes interactivity and immediacy suffer. In the FNSPC, we found that connecting the principals via videoconference helped to take this barrier away. After our module 6 practicum check-in with the whole group, we saw the desire in participants to have more video conferencing and interactive synchronous meetings. From that point on, we held monthly check-ins using the program Vidy. Providing

the course participants with up to three conference options per month allowed us to reach nearly everybody and to increase interactivity. Not only did this help with building community within the course, it also helped to instill confidence in participants who had differing perceptions of everyone's level of comfort with the course or with their own participation. By hearing what others struggled with or where they were at in the course, it helped to assuage fears about their own progress through the course. They also found ways to communicate and provide support to one another through the conferences and in following up from them. Learning that someone else is interested in the same topics or has something to share about past experiences or struggles helped to initiate conversations within and outside the course. Ultimately, these conversations helped in the horizontal transfer of knowledge and skills.

In online learning contexts, learners tend to default to the technologies they know well and are most comfortable with. What we found with the FNSPC pilot is that when an urgent matter arose and a course participant wanted feedback, he or she would send an email to the whole group. The responses often came instantaneously or within a few minutes or hours. Cohort members were generous with their emotional support and helpful advice including sharing resources, additional contacts, stories from past experience, or just words of encouragement. While the forum would have been an appropriate space for some of the requests for information and feedback, participants are more comfortable with email and seemed to know they'd get more immediate response via group email. The reactions and responses would seem to bear out this presumption. Accessing the forum would have meant logging in and then several clicks. The emails, however, were instantaneous and most likely allowed for immediate, direct notification to a mobile device application.

This falling back to email was visible in the MOOC environment too. Many learners wrote to me personally, to a point that was overwhelming during the first running of the course. However, I responded to every request (eventually), and learners were actually pleasantly surprised and happy that I did. This tells me they didn't fully expect to receive a response and knew that it was unlikely for a single person to be able to respond to students individually in a MOOC.

These concerns and limits to personal communication and community building are particularly felt when working in Indigenous education and knowledge contexts. Learning online and communicating via media require low-context, clear communication goals, strategies, and outcomes. Nearly everything has to be explained very clearly, and words and instructions have to be checked numerous times for any possible inference that might lead to misunderstandings or confusion. One exception to this limitation was the tech tutorials which successfully employed images to convey the steps for participating in the course. Indigenous forms of knowledge transfer that include personal interpretation, time for digesting or processing experience, and narrative and stories, often related to particular landscapes, landmarks, or sites, do not necessarily transfer well to this new medium. In the MOOC, we had to be clear from the outset what the course biases would be. For one, most examples would be drawn from the Canadian context as it is what I, as an Anishnaabe and the lead instructor, know best. There was an emphasis on cultures from the Northeastern

Woodlands and more Anishinaabe examples than anything else. To mitigate this bias, our design team attempted to select sources and videos from different regions and to request learners to make connection to their own local context as best as they could for the assignments and activities.

The diversity of nations from which course content could be drawn, a plus in many ways, becomes a con when considering the transferring of Indigenous knowledge arising from one nation, time, and place to another. These teachings are not always meant to be compatible outside their place of origin and face losing richness when divorced from the places that gave them birth, life, and texture. As with the MOOC, the greatest challenge when selecting content to share with an audience that is not familiar to us is that it is impossible to control who will share what with whom, when, and where. Therefore, choices are limited to knowledge that is safe, that any learner may be ready to hear, or that will not bring harm upon someone. There are protocols governing much of the knowledge that is kept within families, clans, moieties, and nations and is not meant for being shared widely. This helps with narrowing down what is safe to share. But there are some stories, medicinal knowledge, and spiritual ways that are best shared only in highly controlled settings with clear guidelines for who may hear them and what they may do with the info. I tried to select teachings and resources that had some transferability and universality in its observation of how people work, relate, and learn.

Developing a community online can be challenging: for the FNSPC we had to think of ways to ignite connection to their physical community where their workplace is located as well as to the community of practice within the course itself. Getting to know each other was important – so important that module 1 was taken in person and a pre-course module was developed to begin breaking the ice among the community. The use of video conference check-ins was also significant. The check-ins were so highly appreciated that they became a monthly activity, altering the course curriculum and experience. This feature was also adopted by subsequent course offerings.

If there is one thing that all Indigenous peoples share, it is the experience of colonialism. In both the MOOC and the FNSPC, there is content related to understanding and addressing colonialism that is applicable across all contexts. However, to properly center Indigenous knowledge, one has to start from the community and the place where it lives and then move outward. When your course is composed of at least 20 different communities, as was the case in the FNSPC, with many of them from completely different nations, languages, and cultures, how are you to honor the specificity of Indigenous knowledge in an online course shell that responds better to low-context communication? The answer that we landed upon was to let the learners do this work on their own in the places where they live and work. We used the 5Rs as a framework to ensure the universal and standardized pieces of the course were balanced by content and activities. Importantly, the content and activities brought community knowledge and experiences to bear on making the learning respectful, relevant, responsible, and reciprocal. The 5Rs teach us how education can accommodate Indigenous knowledge and learning, not the other way around, whereby

Indigenous peoples are meant to accommodate, or conform to, traditional university expectations. The 5Rs are a reference to Kirkness and Barnhardt's (1991) classic article on higher education where they listed the 4Rs of Indigenous higher education as respect, responsibility, relevance, and reciprocity. We've added a fifth R for "relationship," as it underlines and permeates all the other Rs.

By requiring the principals to engage in these learning activities and assignments themselves, making connection to the community where they were, we were ensuring that *relationships*, the underpinning of Indigenous knowledge and education, were being honored, fostered, and, in some cases, initiated. It ensured that there was *respect* for local experiences, traditions, and ways as that became the locus of the activities and the answers sought to complete assignments and activities. It highlighted the *responsibilities* of the principal to the local culture and the families of the children the schools served. We attempted to ensure there was *relevance* to the community and to the principal too so that the learning never felt merely theoretical but was rooted in daily requirements and responsibilities as well as what needed to be attended to every day. Finally, we wanted to ensure that our course ultimately contributed to community self-determination and betterment and didn't merely develop the individual course participant. So, our practicum, or capstone course activity, was essentially a giving back to the school or the community. To ensure reciprocity, we required the course assignment to "give back" and "stay" with the school.

Employing the 5Rs in the FNSPC enabled us to address our second guiding question, of how to design e-learning opportunities that invite all learners to engage with Indigenous knowledges worldviews and pedagogies in culturally appropriate, respectful, and meaningful ways.

Conclusion

Indigenous education is possible in online environments, but it takes some effort and thoughtfulness in order to ensure optimal participant experiences, while best adhering to traditional Indigenous values. There are many attributes and strategies that can help. There has to be emphasis on community building within the course and extensions outside of the course, finding ways to bring participants to connect with place and community. Course designers must strive to encourage participants to see themselves as both learners and teachers. This can be done by honoring experience and experiential learning and the personal stories that emerge from this learning. In this way we honor Indigenous knowledge that is personal, experiential, holistic, and shared through narrative and metaphor.

The course design teams behind the Aboriginal Worldviews and Education MOOC and the First Nations Schools Principals' Course attempted to ground the curriculum and pedagogy in Indigenous approaches. For the MOOC we attempted to balance modes of learning valuing the four aspects of being: physical, emotional, intellectual, and spiritual. We wanted to ensure that people were changed

by the learning: that it went beyond intellectual development to real personal and political commitment to addressing social injustice. When we received feedback that students were forming activist groups, or joining a cause in their community or participating in Idle No More events as a result of their being in the course, we knew that we were succeeding in sparking transformative learning. We intended our teaching and our research on learning in online environments to ultimately have the objective of precipitating action for promoting social change.

This orientation toward action for social change was also visible in the FNSPC. Whereas the principals in the course all cared deeply about the children in their schools before taking the course, we watched as they drew on community resources and from each other as a result of the course curriculum and ways of teaching and learning. There was an increased connection and relationality encouraged by the 5Rs that helped to deepen the relevance and responsibility to community and redoubled the commitment to student well-being and achievement. It was stated by one of our participants that he observed all the principals in the course and in First Nations schools were having to do twice as much work as most principals. As he explained, they were delivering the Canadian curriculum and ensuring their students' abilities to adapt and survive in the mainstream society, but in addition to this requirement, they were providing the tools and cultural teachings to survive in the local community, essentially a second curriculum that included language and culture to ensure a decolonizing learning space for student safety and cultural survival. Being able to do both well was a testament to the challenge of the work, and having a leadership course that recognized this context demanded a different approach was liberating and appreciated by our pilot group. When designing the course, we set out to indigenize leadership programming and see positive changes during the course, not only as a result of the course but as part of the process of learning and applying that learning. For these changes to make an impact was to see social change and transformative learning happening before us and to see a decolonizing action. We witnessed several of Smith's (1999) 25 decolonizing projects being enacted within the course: greater indigenization; connecting, representing, and reframing Indigenous identities, rights, knowing, and realities; and active contribution to these processes through the course practices themselves.

In any course planning, one has to see the limits of the medium and work within it. It's not unlike how Elders see the limits in any setting where they are teaching. Depending on the time, place, and learners they are working with, they adapt what they share and how they share it. So too must we in our course design. Once we know the limits of what can be achieved in this medium, we can push against them and use the technologies to take the best elements of Indigenous education to grow a larger community. Colonialism works by segregating us, separating us, dividing us, and playing us against one another. But by creating a sense of community and shared struggle in our courses, we can all be working to combat colonialism and restoring our peoples to vital sites of cultural resurgence.

Abstract

In New Zealand, the national education achievement statistics identify Māori (Indigenous), Pasifika (Pacific Islanders living in New Zealand), and other students from low income groups as “underachieving” in the education system. This chapter outlines the design, implementation, and outcomes of a longitudinal multifaceted secondary school intervention, named the Starpath Project for Tertiary Participation and Success (Starpath), which was designed to fundamentally change pedagogy and challenge the distribution of opportunities for students in some of New Zealand’s most under-served communities. In this chapter, we provide a brief summary of major school research and development projects carried out in New Zealand addressing the needs of Māori and Pasifika students in English medium schools. Then we provide a description of the project design, including the theoretical background of the approach. Following this, we outline of the New Zealand educational context, how we worked with schools, and the overall demographics of the student cohort. We then document the two phases of the project – the research and its outcomes, and the professional development design and its implementation. This is followed by an overview of the project outcomes and a discussion regarding the project’s mixed success. Lastly, we draw some conclusions regarding what we think is necessary for equitable and quality school reform.

Equity · Research and development · School improvement · Data utilization · Academic counselling · Parent and community engagement

As the first navigators crossed the Pacific they followed the stars from island to island. At the beginning of their journey, they found the star which marked their direction, and followed it until it sank towards the horizon. Then they located the next star on the star path, and the next, and the next, until they reached their destination.

Introduction

A long held view in democratic societies is that *all* students should receive and achieve a high standard of education. Yet there has been a long history of students being educated differently within the same school system according to their class, ethnic, or racial background. While it is accepted by educators, there will be diversity of individual student achievement, entrenched inequity stratified along lines of ethnicity, race, class, or income is viewed as unfair and undesirable, and indicative of inequities within the education system itself. It is also regarded as socially and economically counter-productive for any country to have identifiable sectors of its population failing to achieve educationally and bearing the ruinous consequences of low income, poor health outcomes, and social alienation.

The introduction of Māori language immersion schooling in the 1980s had a transforming effect for Māori students and their whānau (extended family) (Smith 1997). Māori immersion schooling was initiated partly in response to Richard Benton's (1979) identification of the demise of the Māori language and his subsequent suggestion that schooling could be used as a vehicle "save" it. New Zealand now has a Māori medium education system from early childhood education through to secondary schools. The Māori immersion system became popular as students graduated not only having achieved academically, but also with the "cultural assets" of Māori language and having a greater depth of understanding Māori culture. These schools remain successful for the students who attend them; however, the number of students attending these Māori medium schools remains small (9.6%) in comparison to Māori students in English medium schooling (90%) (Education Counts 2017). Of all the students in Māori medium education in 2016, 82% were in primary (elementary) education. This suggests that Māori students are transitioning between Māori medium and English medium schooling options at a crucial point – upon entering secondary school. So, with an overwhelming majority of Māori students in English medium (also known as mainstream) secondary education, lifting their performance within this system is an absolute imperative.

In New Zealand, the national education achievement statistics identify Māori (Indigenous), Pasifika (Pacific Islanders living in New Zealand), and other students from low income groups as "underachieving" in the education system. This chapter outlines the design, implementation, and outcomes of a longitudinal multifaceted secondary school intervention, named the Starpath Project for Tertiary Participation and Success (Starpath), which was designed to fundamentally change pedagogy and challenge the distribution of opportunities for students in some of New Zealand's most underserved communities. In this chapter, we provide a brief summary of major school research and development projects carried out in New Zealand addressing the needs of Māori and Pasifika students in English medium schools. Then we provide a description of the project design, including the theoretical background of the approach. Following this, we outline of the New Zealand educational context, how we worked with schools, and the overall demographics of the student cohort. We then document the two phases of the project – the research and its outcomes, and the professional development design and its implementation. This is followed by an overview of the project outcomes and a discussion regarding the project's mixed success. Lastly, we draw some conclusions regarding what we think is necessary for equitable and quality school reform.

Previous New Zealand Research and Development Initiatives

In this outline of the previous research, the authors have chosen to privilege the research and development work carried out in New Zealand. While colonized countries share some similar experiences, and British colonies have derived their education systems from similar beginnings albeit at different times in history, New Zealand's school systems and peoples have taken some different paths. It is

also very difficult to find longitudinal research and development programs done internationally that report on outcomes for Indigenous students. For these reasons, and others, we have decided to highlight New Zealand longitudinal research and development programs in this section.

The disparity between various groups within New Zealand schools gained increasing attention over the 1990s and early 2000s. International tests showed that there were greater disparities within New Zealand schools than between them. In other words, the gap between the high and lower achieving students within the same school was one of the largest in the OECD countries (Ministry of Education 2015). In particular students who went to schools that served low income communities, in which Māori and Pasifika communities are over represented, were not enjoying the same success as their wealthier counterparts. These schools have been the focus of some large school reform projects that have achieved some success. In particular there were two major, long-term projects described below that contributed to the development of the Starpath project.

The Strengthening Education in Mangere and Otara (SEMO)

This project targeted schools in two low-income suburbs in South Auckland that cater for New Zealand's largest Pasifika community. The purpose was to increase the capacity of the schools and communities to offer high quality learning environments for students (Robinson and Timperley 2004). The project was undertaken with a three-way partnership between the Ministry of Education, the schools and the communities, and targeted the areas of school governance, reporting to parents and the perceptions of Pasifika student achievement. In the study, some schools had as many as 95% Pasifika students (not uncommon for South Auckland schools).

The findings of SEMO, of relevance to this chapter, showed that good progress was made with schools' reporting practices as they became increasingly focused on educational achievement, which resulted in changed reporting regulations as well. The schools went from under reporting underachievement and misleading parents about their child's achievement levels, to increasing their reporting against explicit standards (Robinson and Timperley 2004).

When teachers, parents, and students were asked about improving Pasifika student achievement, two major factors were identified: teaching quality (including teacher attitudes, changing teaching practices) and home-school partnerships. These factors have since become a major focus for intervention (see Rubie-Davies 2015). While schools practiced more accurate reporting on achievement post-SEMO, they still did not seek to partner with Pasifika parents more for the purpose of working together to improve student achievement (Robinson and Timperley 2004).

Another important contribution was that SEMO also highlighted the many complexities of working within a significantly Pasifika cultural context. For example, Timperley and Robinson identified Pasifika board members and parents' cultural tradition of deference to high status educational professionals, schools needing to promote Pasifika students' identity, and building on the cultural strengths Pasifika

students bring to school. They also found many of teachers and principals had lower expectations of Pasifika students (Robinson and Timperley 2004). These identified factors have become sites of further research in New Zealand (see Coxon et al. 2002; Chu et al. 2013; Turner et al. 2015).

Te Kotahitanga

Te Kotahitanga was designed to improve the educational achievement of Māori students in mainstream high schools (Bishop et al. 2010). The Ministry of Education funded the research and development project which was developed from a “unique perspective, in that it draws on the ways of knowing of people most affected by educational disparities, and [...] built on Māori aspirations, preferences and practices for educational reform” (Bishop et al. 2010, pp. 13–14). An Effective Teaching Profile was developed from interviews carried out with Māori students, their families, principals, and some of their teachers, to provide the focus for an intervention targeting classroom pedagogy and professional development.

Importantly, Te Kotahitanga drew our attention to the importance of relationships between teachers and students in the classroom, arguing that establishing whānau (extended family-like) relationships in the classroom was central to Māori student engagement. The developed strategy became known as a “culturally responsive pedagogy of relations” where teachers focused on improving Māori student achievement through developing their own understandings of antideficit theorizing and agentic positioning (Bishop et al. 2007, p. 7). The strategy includes changing the institutional structures in their classrooms; distributing leadership through the development of power-sharing relationships; spreading the reform to include all students in the benefits of participation in the conversation of learning; formally and informally monitoring and evaluating Māori students’ (and others’) progress so as to inform their changing practices; and above all, schools and teachers taking ownership of the aims and objectives of the project (Bishop et al. 2007, p. 196).

Results from the project indicated that Māori students, whose teachers were in the project, increased their academic achievement in mathematics and in literacy, especially students in the lower to mid-range of achievement. The project also found positive trends in measuring the quality of teacher practice (in terms of establishing whānau relationships) and student performance (Bishop et al. 2007). The Starpath Project consequently included in their design the establishment of trusted learning relationships between teachers and students to increase Māori students’ engagement in learning. Starpath also deduced that it would be beneficial if students could build a relationship with at least one significant adult (Darling-Hammond 2010) whom they recognized as “knowing them” and displaying an ethic of care about them as people and as learners (Webber et al. 2016). In addition, and by implication from Te Kotahitanga’s results, engagement with Māori parents/whānau and building further trust between them and the school was also seen as critical.

One of the wider influences in New Zealand is that there are national policies that guide schools, such as national curricula (in English and Māori), Māori education

policy and plans, and a Pasifika Education plan. Most important to note in this chapter is a policy on Māori student achievement called *Ka Hikitia* that promotes “Māori success as Māori” no matter which system students participate in. The policy argues that this outcome can be achieved by attending to each student’s academic performance as well as Māori language, culture, and identity. *Ka Hikitia* promotes quality evidence-based teaching and learning experiences; high expectations; collaboration between schools, parents, students, and the wider community; and that all Māori students have access to learning pathways of their choice (Ministry of Education 2013).

Project Background

The Starpath Project for Tertiary Participation and Success (known as Starpath) was established in 2004. The idea for the Starpath Project emerged from discussions at the time on building a knowledge economy in New Zealand (Gilbert 2005). The development of human capability and skills for a knowledge society, particularly among those groups currently under-represented in degree-level education and high skill employment (Māori, Pasifika and other students from low income backgrounds), was considered to be one of the most fundamental and urgent challenges facing New Zealand at the time. It had been predicted that by the year 2050, approximately 57% of New Zealand’s population would identify as Māori and/or Pacific Island, while more than two thirds (68%) would identify as non-European/non-Pākehā (Ministry of Education 2001). As such, the greater Auckland and Northland regions were chosen as the project base because they are home to New Zealand’s largest Māori and Pacific Island populations. These striking shifts in the country’s demography, coupled with unacceptable patterns of educational underachievement for the groups above, put at risk the prospect of developing and sustaining a high income, high value knowledge economy in New Zealand (Gilbert 2005).

This concern accompanied the view that New Zealand’s relatively young population had the potential to give the nation a major competitive advantage, if only all New Zealanders had the opportunity to realize their educational potential. Consequently, the Starpath Project was proposed in recognition of the urgency of this challenge and subsequently tested and coordinated a set of robust and reliable research and development projects, so that at each critical transition point in the educational life cycle, an evidence-based initiative could lift the educational performance of students to new levels.

Gilbert (2005) premised that in a knowledge society all students would be catered for through multilayered, individualized programs accessing the resources they needed at any given time for their learning journeys. Working on the assumption that the educational achievements of each student addressed achievement statistics of groups as well, it was important that Starpath worked with schools to help them address the learning needs of every student in the schools *in a timely manner*.

At the time of implementation, New Zealand was in the initial stages of employing data-driven evidence to confront achievement disparities and did not

wish to adopt a one-dimensional view of evidence (i.e., high stakes testing) apparent in other countries. Rather, Starpath was premised on the notion that “achievement gaps” can be decreased through responding to data-driven evidence and individual school accountability across a variety of dimensions. The project opted for a partnership between all stakeholders (university, school, teachers, parents, students), a wide view of evidence, and individual schools “owning and driving” the data strategy deployed in the school. Up-to-date data became the core of the project – tracking and monitoring student learning and achievement progress, setting individual student and school targets, assisting with professional learning in schools, and engaging parents/caregivers and students in learning conversations. In order to achieve the data focused intervention, schools needed to undertake significant professional learning.

The over-arching rationale behind the Starpath Project was to ask the question “how do we work with schools (and their stakeholders) to build and implement effective evidence based strategies to assist them to achieve more equitable outcomes for underachieving groups of students?” From the beginning the project was concerned with both research based and practical and pragmatic strategies. Therefore, a mixed methods research and development approach was employed, and Starpath worked alongside schools advocating for a systematic approach to inquiry as a basis for schools to ask questions of themselves.

The New Zealand Education Context

Students are required to attend school in New Zealand from the age of 6–16 years. However, most children begin on their 5th birthday and are increasingly staying at school until the age of 17 or 18. In all, schooling in New Zealand is made up of 13 Year Levels, with primary (elementary) schooling Years 1–8, and secondary (high) schooling Years 9–13.

Approximately 95% of all New Zealand students attend government-funded schools (referred to as state and state-integrated school – e.g., Catholic schools). Students are entitled to go to their local school for which they are zoned. At the time of the project and over its duration, all New Zealand state and state-integrated schools were assigned a category (referred to as decile ratings) reflecting the socio-economic nature of their intake for funding/resourcing purposes. High decile schools had the lowest proportion of students from low socio-economic homes; low decile schools had the highest proportion of these students. The Starpath Project worked with low-mid-decile secondary schools in the wider Auckland and Northland region.

New Zealand introduced a new national qualification system in 2002 that was innovative in that it catered for senior secondary and tertiary education on the same framework. The senior secondary school qualification is called the National Certificate in Educational Attainment (NCEA) (New Zealand Qualifications Authority 2016). Students can achieve NCEA at 3 levels (NCEA 1, 2 and 3) that approximately match onto the last 3 years of secondary school (Years 11–13). Students enroll in

subjects, and in each subject, skills and knowledge are assessed using a number of standards. There is a range of internally and externally marked assessments to measure how well the students achieve. Internally marked assessments undergo a national moderation process. When students attain an achievement standard, they gain a number of credits depending on how difficult the standards are. These credits accumulate towards a qualification (NCEA Level 1, 2, or 3). There are various criteria that need to be met to go from one level to another (e.g., credits in literacy, numeracy) (Madjar and McKinley 2013). The NCEA assessment system allows teachers to track and monitor credit accumulation towards the national certificate over the year.

This assessment system is extremely flexible and complex, as it offers a wide range of standards where students can gain qualifications towards trade certificates or they can qualify for entry to university (Madjar and McKinley 2013). However, it can also place students onto academic pathways that are narrow and restrictive, particularly if students are uncertain about their goals, lack good advice, and do not choose their courses with care, or if schools do not offer appropriately challenging NCEA courses. The Starpath Project targeted the NCEA system to develop a data-driven evidence-based intervention.

It is worth noting here that by the time Phase 2 was implemented the New Zealand government had a national goal to maximize success at NCEA Level 2. Resources were deployed to support student achievement at NCEA Level 2 and schools reported on this level. This, in turn, influenced school targets (and possibly student ones too), in that, instead of focusing on what the evidence (school data) was saying about what individual students could achieve, many schools focused on students achieving the NCEA Level 2 target.

Working with the Schools

Starpath was designed to be a partnership-focused research and development project. The aim was to be a key learning partner in the school improvement process. As a result, a participatory action research (PAR) approach (Reason and Bradbury 2008) was used as a guiding framework for data collection, reflection, negotiation, and agreement on specific actions and professional development work to be undertaken by the schools and the Starpath team. The PAR approach allowed us to pay equal attention to the two key aspects of the project: implementing the intervention and evaluating its effectiveness, impact, and potential for transferability and sustainability.

The PAR design maximized the collaborative aspects of the relationship with each school and built on the schools' capacity to use data to inform their decision-making and classroom practice, as well as to contribute to evaluation research. We could not require individual schools to follow a single protocol and recognized that because of the differences in context it would have been impossible for them to do so. We needed to be collaborative and responsive to how different schools chose to implement the intervention.

School and Student Demographics

Starpath worked with 39 low-mid-decile secondary schools in the wider Auckland and Northland regions of New Zealand. The schools were chosen according to stated criteria that included size, decile rating, and population characteristics. Of the total student population across the 39 schools ($N = 19,000+$), 29% were Māori and 29% were Pacific Island students. From a national point of view, Starpath schools included approximately 43% of the total Pacific Island and 14% of the total Māori New Zealand secondary school student population. School size also varied considerably as Starpath schools came from both urban and rural areas. Twenty-six percent of the schools had less than 500 students attending them, 28% had 500–1000 students, and 46% enrolled over 1000 students. The smallest school had approximately 100 students, while the largest had over 2000. With priority being given to schools that served the lower socioeconomic communities, 87% of Starpath schools had a decile rating of 4 or less. Sixty-two percent of schools were in urban areas and 38% in rural areas and small towns. We personally approached and met with the Principal and/or senior leadership teams in each school. Ethics was sought and approved by the University of Auckland Human Subjects Ethics Committee, and procedures were strictly adhered to for all aspects and phases of the project.

Project Description

The Starpath Project was divided into two phases.

Phase One (2005–2010)

The first phase of the project was a collaboration between two tertiary institutes and five high schools. During the first 5 years of the Project, the Starpath team completed over 25 quantitative and qualitative studies that focused on identifying barriers to student participation and achievement, examining the context and impact of the recently introduced NCEA system in secondary schools, and testing a program of academic counseling and target setting. This broad range of studies included: carrying out factor analysis studies on issues impacting student achievement (e.g., subject choice) and its effects on student pathways to university; university secondary school outreach programs in mentoring and academic assistance; an analysis of learning support programs in schools; a prospective, longitudinal, narrative enquiry of student transition from high school to university; a quasi-experimental effectiveness study of an academic counseling and target setting (ACTS) initiative; a mixed methods evaluation of ACTS initial impact and its sustainability in the original school; and a mixed methods, participatory action research of ACTS transferability to 4 other schools. The project also spent time interrogating school data – what was kept, where, how it was managed, accessibility by all teachers, and how schools and teachers used it to improve their teaching and student learning.

Findings from the first phase identified a series of structural and systemic barriers to student achievement and progression to degree-level study. Significant findings included:

- The poor collection, management, and use of data to track student achievement over time and allow for timely academic interventions (Irving and Gan 2012)
- Unequal access to relevant NCEA subjects and relevant standards for university pathways (Shulruf et al. 2008a)
- Inadequate understanding of the NCEA system and the medium and long term implications of subject choices by parents, students and teachers (Madjar et al. 2009; Madjar and McKinley 2013)
- A lack of evidence-based academic guidance of students (Webber et al. 2016)
- Failure of students to reach the literacy standards required for university entrance (Smith and Timperley 2008)
- A proliferation of student support programs outside the core curriculum, and little to no evaluation of these initiatives regarding their impact on student achievement (Shulruf et al. 2008b)
- A lack of capacity in schools to move from collecting data to identifying issues in student learning and formulating interventions (Tolley and Shulruf 2009)
- Numerous challenges during the transition from school to university for students from these schools (Madjar et al. 2010a, b; McKinley and Madjar 2010)

From these findings, and the evaluation of some school practices developed and trialed in partnership with the five Phase 1 schools a comprehensive, school-wide intervention was designed for Phase 2.

Phase Two (2011–2015)

Phase 2 of the project worked with 34 new schools (39 schools in total) on an evidence-based program that focused on:

1. Establishing quality longitudinal data and student information systems that could be used to track and monitor student progress to ensure that each student's academic progress was known in real time and timely interventions could be provided to ensure best possible outcomes. This required quality data to enable staff and students set achievement targets, for individual and groups of students.
2. Working with schools and teachers to develop teacher knowledge and skills to help students understand the path, they needed to follow to fulfill their educational goals and enable them to chart their progress (also known as 2-way academic counseling conversations).
3. Helping schools to engage with students' caregivers or parents/whānau (families), as partners in their child's learning journey. Doing this was a way to ensure clearer understanding of educational opportunities, promote more in-depth discussion about their child's learning needs, and work with parents on how best to support their child's educational goals and progress (also known as 3-way Parent-Student-Teacher conferencing).

The professional learning and development program that Starpath implemented in schools was comprised of Data Utilization, Academic Counseling, and Target Setting (known as DUACTS). In Phase 1 the DUACTS program had been developed and tested for its academic effectiveness (Smith 2010), and overall impact on students, teachers, and the school (McKinley et al. 2009) in one school. The program was then implemented and evaluated in a further 4 schools, both urban and regional, to test for transferability to other school contexts (McKinley et al. 2010).

Implementation of DUACTS

The Phase Two implementation of Starpath in schools included on-site direct assistance for teachers and school leaders, regular observations of data utilization, academic counseling, and target setting and other professional learning and development (PLD) support through the provision of workshops. Some of the PLD work was generic and was presented to all schools in the project, but other PLD was responsive to the needs expressed by individual schools. Following the introductory presentation made by Starpath staff visiting each school, the DUACTS professional development program had two major strands. One was focused on each school's capacity to collect and use student achievement data for improvement purposes and the other was on improving academic conversations between students, teachers, and families. Baseline data were collected and improvements tracked in student achievement and school practice in a series of formative, individualized reports which were fed back to all schools.

Data Utilization

Without a capacity for longitudinal tracking, it is impossible to discern whether a student or group of students are on track to achieve their goals and aspirations. It is also difficult to determine when a student or group of students begins to head towards failure, discover the reasons why, and take effective action. A key aim of the DUACTs program was to enable each school to develop and maintain an up-to-date school achievement database. It was viewed as an essential tool to enable schools to collect longitudinal data on student achievement and use those data to improve practice and outcomes for students over time. However, evidence collected by Starpath indicated that many schools struggled to maintain their databases, particularly if key project personnel with data utilization expertise left the school. Ongoing support was required for schools to achieve this goal.

Role of the Student Achievement Manager (SAM)

One of the first tasks was to train the person identified as the Student Achievement Manager (SAM). Some schools also nominated an administrative assistant who

supported the SAM with data storage and analysis. After locating all student achievement data in a school, assistance was provided to the SAM to create the database using Microsoft Excel, so that each school could interrogate patterns in student achievement over time. Approximately 45–50 people were involved in these individual professional learning sessions.

The staff development workshops for SAMs and their assistants introduced new skills such as merging data, target setting, manipulation, and interpretation of data. Subsequent workshops concentrated on techniques for target setting (individual and group) and data analysis using data visualization tools. After initial training, there was a program of regular school visits by Starpath staff to support the tracking of student achievement results, to provide feedback on data utilization work being undertaken within schools, and make suggestions for improvement. Individual coaching was provided to better understand and use student management systems in schools. Reports were written up for the individual SAM, school, and school leadership teams.

In the second and third year of the project, there were further workshops based on using data for discussion and planning, including the development of data teams. At times SAMs were accompanied by nonteaching staff who supported data utilization within their school. In response to requests from schools, Starpath facilitators provided training on interpreting assessment data and using these data to develop next steps for teaching and learning.

Target Setting

Prior to intervention, the process of target setting in schools was for each year level cohort and consisted of extrapolation from previous years' results. With the introduction of the EDB, it was possible to use the individualized longitudinal achievement data to estimate a target number of credits for each individual student in a cohort and therefore to predict whether each student would reach the credit threshold for the award of NCEA. By aggregating the outcome for each student, a whole-cohort target could then be set. Part of the challenge of this work was ensuring high expectations for students so that targets encouraged teachers to push and support students to do their personal best.

An innovative approach, using a modified form of data envelopment analysis (DEA), was introduced and the SAMs were provided with training to implement the process early in the school year. DEA is a method for measuring efficiency of decisions using linear programming techniques to envelop observed the relation between inputs (such as PLD, course taking) and outputs (e.g., achievement, course taking, student retention). The method allows multiple inputs–outputs to be considered at the same time and efficiency is measured in terms of a proportional change in inputs or outputs. It has many other features that allow schools to see the effects of each and combined inputs, whether it is worthwhile to minimize certain inputs and the consequential effects on outputs, and can show the weightings of relations to best maximize individual or combined outputs (see Cooper et al. 2004; Smith 2010).

This process, however, proved to be too time-consuming for schools at a busy time of the school year (at a minimum, half a day per cohort), and the SAMs abandoned the process in favor of the simpler extrapolation method they were more familiar with. For individual students, the de facto target reverted to the award of NCEA Level 1, 2 or 3 according to the year level of the student.

Academic Counseling (AC) and Parent-Student-Teacher (PST) Conferences

Schools were asked to nominate one or two teachers who would take responsibility for coordinating two-way academic counseling (AC) and the newly introduced three-way parent-student-teacher (PST) conferences. The first workshops covered the key ideas and shared strategies for introducing the practices in schools. Starpath also provided resources and initial professional development to support the establishment of these practices. Staff at two Phase 1 schools agreed to share their practices through the production of a video. Schools were encouraged to use this in their own professional learning programs, particularly when training new teachers. Most Phase 1 schools shared resources they had developed for academic counseling and student-parent conferences. These resources were stored in a private website so schools could easily access templates. In the second and third year of implementation, workshops were held that enabled the AC and PST coordinators to meet and reflect on the introduction of the two and three-way conversations and to share any feedback they had collected from students, parents and staff. Ideas were shared willingly, including the successes and challenges of actual implementation.

The principal message of the academic counseling program was that every student should have a significant adult (generally called an academic counselor) who had responsibility for overseeing his or her academic progress. Using achievement data, the academic counselors were asked to help their students formulate learning goals and work with them to plan their pathway through the NCEA Level 2, 3 and UE qualifications. Different schools arranged different times and locations for these conversations depending on their own timetable structures.

All Starpath schools adopted some form of academic counseling, albeit with some variation. For most of the schools, academic counseling sessions were conducted throughout the year with individual students having at least one conversation per term. In a couple of schools, the time for academic counseling was concentrated into two- or three-week blocks and these AC-intensive periods would occur two or three times per year, often a few weeks before the PST conference.

The academic counselor was generally a teacher who met with the student and their family for an extended PST conversation about the student's progress and learning plan. It was expected that schools would replace the traditional short five-minute subject teacher meetings (with 5–6 individual teachers) with a 20- to 30-min conversation where families and students discussed the students' overall progress with the academic counselor. The intention was that the student-led conversation would be based on achievement data and other evidence of learning.

Thirty-six schools introduced the PST conferences, although in one school they were implemented in Year 11 only. Two schools made the deliberate decision not to hold PSTs. All schools that held Starpath-style PSTs asked the form teacher to be the teacher in the three-way conversation. This meant that for 9 of the 39 schools the teacher involved in the PST *was not* the academic counselor. Twenty-one schools in the project held the three-way PST conference once a year. For 15 schools, PSTs were held more than once a year. In many of these cases, the first meeting was used to discuss student goals for the year with the second used as a review meeting. At least two schools continued to hold the traditional subject teacher/parent interviews as well as the new PST conference.

Towards the end of the project, the emphasis of the PLD program was on helping schools to sustain and embed AC and PST practices. The Starpath facilitators responded to schools asking for reflective workshops and the training of new academic counselors. Some schools were also interested in how they could embed processes for self-reviewing.

Project Outcomes

The goals of the project were to improve student achievement at each level (1, 2, and 3) of the National Certificate of Educational Attainment (NCEA) and University Entrance (UE) in each of the 39 schools, year on year, with the added goal of improving the opportunity for these students to entry degree level study after secondary school in either a Vocational or University institution. The overall measures included students' NCEA pass rates, entry into degree level study and retention into the second year of their degree.

Achievement gains were seen across NCEA Levels 1–3 for all students but disappointingly not for UE during the term of this study. Māori students made year on year gains across all levels and progress was particularly notable across NCEA Levels 2 and 3. Most Starpath schools made considerable gains in the percentage of students passing at each level of NCEA after the intervention compared with the percentage pass rates prior to the intervention, and most schools' gains were larger than the national gains for the same period. However, the patterns of student achievement across the schools showed considerable variability. This variability can be seen across NCEA levels at the same school, between pass rates year-on-year at the same school, between similar schools, between low and high decile schools, between ethnic groups at the same and different schools, and between boys and girls at the same and different schools. (See Fig. 1).

Starpath was also able to look at the progression of students from Starpath schools into degree-level study. Results showed that in their first year of tertiary study, the participation rate of students who had attended any of the 39 Starpath schools in degree-level study was 19.6%. The second year saw a significant retention rate of 86.9% into the second year of degree-level study. The participation figure was lower than the national participation rate, but the retention data exceeded the national retention rate in 2010, which was 77%. In Starpath schools, females participated in degree-level study at 150% the rate of males. Approximately 10% of Māori and Pacific Island students undertook degree-level study, while between 20% and 30% of

Fig. 1 Average shift across pre- and postintervention years for all 39 Starpath schools by level of NCEA

their NZ European and Asian peers did so. The progression to degree-level study of students from each of the main ethnic groups was parallel to their success rate for university entrance.

Data Work in Schools

An underlying premise to Starpath was the ability of the school and staff to establish, use, and sustain an up-to-date database that was accessible for all staff to use in their

evidence-based conversations with students and families regarding learning progress. While all schools had commercially developed student management systems, none operated in a way that enabled schools to track and monitor learning in real time nor did they enable schools to carry out longitudinal comparisons of cohorts. As noted above, Starpath developed a comprehensive evidential database template (EDB) for the schools to follow and populate. Initially Starpath provided resource to schools, in the form of release time for a staff member, and then ongoing support and professional development from the Starpath facilitators. Again, there were mixed results. Only 21 schools managed to maintain the database over the life of the project, while the other 16 schools struggled to maintain theirs. One other school had their own unique database developed before joining the project, and another rural/remote school was so small and its student cohort so transient, that the EDB was not useful in terms of revealing achievement patterns.

Using data to assist in raising the achievement of different student groups across all year levels was a key issue amongst many schools. Staff reported there was a need to develop effective data utilization along with high expectations approaches. Principals were particularly concerned about the lack of staff capacity to interrogate student achievement data and to use the data to improve classroom practice and student outcomes. Another challenge encountered was that different types of data (quantitative and qualitative, formative and summative) were needed for different purposes and at different levels of the school, and that data were not always fit for purpose. At times Starpath was criticized for not doing enough to assist schools, and many principals believed more professional learning and development opportunities were needed in data utilization to enable leaders and teachers to make evidence-based decisions. However, qualitative interviews with the teachers and school principals found that the Starpath data work undertaken in schools: (1) increased the focus on students, their goals and aspirations, and their achievements across the school community; (2) made student achievement data more visible to everyone (school leaders, teachers, students, and parents/caregivers); (3) resulted in more effective use of achievement data and increased tracking and monitoring of individual students and groups of students; (4) ensured that achievement data became a focus for discussion in academic counseling and parent-teacher-student conferencing; and (5) resulted in greater alignment of in-school activities to support student aspirations and learning (Kiro et al. 2016). Results from the 2016 Starpath evaluation suggested that more focused and intensive collaborative inquiry work is needed with data utilization and its use in New Zealand schools.

Academic Counseling and Parent-Student-Teacher Meetings

It was clear from Phase 2 participant interviews that most teachers, school leaders, and students valued academic counseling and viewed the work as beneficial to school improvement. Eighty-five percent of positive comments within teacher and school leader interviews were related to the value of the Starpath intervention, particularly the academic counseling and parent-student-teacher meetings.

Seventy-four percent of positive comments by students were related to the positive impact of academic counseling. Major positive themes included improvements in student motivation and increased perceptions of support for student academic progress within school communities. Results suggested that:

- Goal setting and academic counseling had positively affected motivation and performance for students.
- Effective academic counselors assisted students' current performance and/or work futures/aspirations.
- Students now had an enduring relationship with a significant adult in their school life (the academic counselor) and a wider and more connected network to support their academic development.
- Students and their families were better informed and better prepared for the academic journey and that this would lead to advanced education and/or employment.

A major pattern to emerge from this analysis was that perceptions of effectiveness were dependent on the quality of relationships and school cultures, the regularity of school tracking and monitoring systems, and structures and the degree to which the academic counseling and parent-student-teacher conferences communicated high expectations, became learner-centered and truly celebrated student diversity. It was found that the *quality of relationships* was key to determining the effectiveness of academic counseling. A common response was that relationships had improved, particularly between students, families, and academic counselors. Teachers were viewed as more responsive to students and families outside of allocated/regular consulting hours. Communication was considered more honest, open, and data-based, and students were generally happy with teachers' knowledge of the national NCEA qualification system and its intricacies. Other positive impacts included teacher and student perceptions of improved school climate, a shared focus on student goals and aspirations as well as celebrating students' academic achievements. The changes were seen to positively impact on student motivation and engendered a school culture of academic success.

Although there were many positive comments about academic counseling, participants were also acutely aware that the quality of counseling varied depending on the skill, knowledge, and attitudes of academic counselors. A common response was that the skills, knowledge, and attitudes of academic counselors often determined the effectiveness of these sessions. Students saw that the quality of relationships evidenced through academic counseling sessions was dependent upon multiple factors including the expectations, expertise, and motivations of teachers; how decisions in academic counseling sessions were reached; students' lack of confidence in goal setting and the degree to which they were helped; as well as whether students could be honest with counselors. Students were most concerned about dispassionate teachers who held low expectations of them (Kiro et al. 2016).

Participants believed that academic counseling was only effective if existing school cultures, systems, and structures were transformed to be more student-

centered. Māori and Pasifika students were most likely to talk about low teacher and community expectations and about the damaging impacts of negative stereotypes associated with being seen as “low achievers” and having “limited potential.” Some believed that teachers had counseled them and/or their peers into less academically challenging courses, and that a form of academic differentiation or profiling was emerging based on inadequate evidence about their abilities.

Through undertaking more focused work, individual school leaders spoke of becoming more aware of *holes* in their school systems, particularly related to tracking and monitoring students through academic counseling sessions. Barriers to improving practice and student outcomes included the need to up-skill academic counselors on how to access student data and use it effectively and having specific resources to record student goals and progress. Ineffective academic counseling also impacted on students’ sense of purpose and their attitudes to learning, according to some teachers. These teachers reported feeling frustrated at the inconsistent approach within their school and the variability of ownership of the program among teachers and school leaders.

School records of family attendances at PST conferences were available from 34 of the 39 Starpath schools during 2007–2014. Analysis of school-reported data, including analyses of family surveys, indicated significant improvements in family engagement and attendance over time. For example, in 2014, 30 Phase 2 schools provided PST attendance data and the median PST attendance percentage was 71.5% which is a substantial improvement (an increase of 48.5%) when compared to the reported traditional parents’ evening attendance of 23% in 2010. Schools that continued to document attendances reported a sustained turn out of families at these meetings, particularly Māori and Pasifika families. The increase in the numbers of parents attending the PST conferences was sizeable, and more in-depth conversations were undertaken because of the longer appointment times. A face-to-face conversation, with an academic counselor for an extended period, also afforded many parents the opportunity to communicate in a culturally appropriate manner (Webber et al. 2016).

Overall, the results showed striking improvements in some focused areas and less success in others. For example, many of the schools continue to operate some form of AC and PST meetings successfully, but most schools struggled with the ability to sustain the up-to-date database. A few schools that had good instructional leadership and cohesion across the program performed consistently well (for more detail see Kiro et al. 2016).

Key Challenges in the Starpath School Reform

The use of the metaphor of the star path in Māori and Polynesian navigation was an appropriate one for this school reform project. As indicated from Phase 1 in the project, in addition to further international research, there are a number of school factors that can have great effect on the achievement of all students. These include the use of data, tracking, instructional leadership, teacher attitudes and beliefs, high quality curriculum, resource allocation, parent and community engagement, student-teacher relationships, and quality teaching (Bishop et al. 2014; Darling-Hammond

2010; Hattie 2009; Robinson 2010; Rubie-Davies et al. 2012; Webber et al. 2016). These factors (among others) have become the “star path.” As a consequence, students have had to learn to navigate their way through schooling to achieve their potential and reach their destination, negotiating a raft of factors that significantly affect their achievement.

While many of the factors are not new, grappling with the complexity of this work is still not well understood by the school improvement research. Juggling the implementation of this reform project, and ensuring all the details were attended to, proved difficult for both the schools and the Starpath team. In the following section, we offer thoughts as to some of the enduring attitudes and beliefs about teaching that impact on the redistribution of opportunity and success. These attitudes and beliefs were shown to be resistant to significant change. Not all of these challenges exist in every school, but we have highlighted those that we identified as being prevalent or longstanding.

The Use of Data

Schools collect a large amount of data about students, but we found that they did not always use it to best, or in some cases, any effect. Substantial professional development was needed in relation to data collection, storage, and use, NCEA qualification criteria, and using the data to facilitate parent-student-teacher conferences and conduct academic counseling. While some schools had staff with strengths in this area, the vast majority of schools needed significant external input and professional development. Attending to school-wide data literacy skills in terms of accessing and using data, and increasing teacher understanding of the value of longitudinal student data with respect to enhancing student performance, was a significant ongoing issue.

We encouraged schools to collect and use a wide range of data as it allowed them to set high goals (targets) for individual students and groups of students, determine the curriculum content (and rigor) the students were getting, monitor student’s progress allowing for timely intervention, and inquire into teacher and school practice. While the Starpath team could assist with developing ambitious targets for individual students and groups of students (school targets), the conversion of the targets into the strategies required to achieve the targets was far more difficult. Schools were excited about being able to set targets and enjoyed demonstrating how they could use their own data to do it. The “teaching” consequences of tracking and monitoring, however, were often not well thought through. In particular, many teachers did not know how to scaffold student learning to reach these targets or design school-wide acceleration programs to lift Māori and Pasifika student achievement. The full benefits of the Starpath program could only be realized if the structural barriers (such as course design) were removed, and the pedagogical practices were made more responsive to identified students’ needs.

In Starpath, diagnostic data were used at an individual student level to inform tailored academic counseling (AC) and parent-student-teacher (PST) conferences.

Data at this level were essential for students, teachers and families to track and monitor individual progress, aligned to student aspirations and career trajectories, and assess progress towards national qualifications. However, the study also indicated that Māori and Pasifika students had the lowest proportions of enrolment in externally assessed standards of any ethnic groups. There are clear implications here for academic counseling within schools and for greater alignment and coherence between school offerings and degree-level study requirements. Data-focused inquiry work must be coupled with high expectations teaching and a thorough examination into whether there are equitable opportunities to learn for culturally diverse students across different socio-economic communities (Rubie-Davies 2015; Wilson et al. 2016).

Parent/Community Engagement and Partnerships

Adult, and especially family engagement with a student's educational progress, has been shown to have a positive influence on students' belief in their ability to succeed in their educational and career choices. Involving family assists them to understand what the student needs to do to succeed (Grubb et al. 2002). A Best Evidence Synthesis conducted by Biddulph et al. (2003) supported the conclusion that parental involvement in school programs enhances their understanding of how to help their child educationally. Furthermore, when schools actively showed respect for the dignity and cultural values of the parents, there was a positive impact on student engagement and achievement.

The AC and PST meetings, and ongoing parental/family engagement, were considered essential pillars for Starpath in terms of supporting the overall aims of student academic achievement. Although many parents/families were better informed and supported, there were also many benefits for the students including taking more responsibility for their learning, developing strategies to lead academic discussions with parents about their learning, and feeling pride in accomplishments and overcoming challenges. All of the schools that introduced PST meetings had enormous success particularly in attracting parents who had not previously attended traditional report evenings and might not have had any contact with the school. Parent surveys in some schools indicated an overwhelming preference for 15–20 min PST conferencing as opposed to traditional five-minute conferences with 5–6 teachers in a row. Improved family attendance subsequently increased the teachers' sense that they could positively influence students' learning. Increased family attendance also challenged teacher preconceptions about parents' interest in their children's education. While this was a great motivation for schools and resulted in parents engaging more, it fell short of developing full partnerships. The Starpath data showed that schools were still very reluctant to genuinely work in partnership with Māori and Pasifika families if it meant authentically changing the school culture, timetables, and/or advocating unapologetically for Māori and Pasifika initiatives to the wider school community.

Leadership

As recognized in the educational research literature, effective school leadership is essential in the success of any school improvement initiatives (Robinson 2010). School leadership is often determined by the personal experiences, strengths, and styles of individual principals. Leadership issues in Starpath schools were complex. The project challenged the status quo (such as current levels of student achievement), called into question established practices (such as data management and use), implied the need for external assistance (where skills in areas such as target setting were missing), and brought expectations of additional work, change, and surveillance. These important issues were not always addressed by school leadership.

The principals needed to be unambiguous in making their view of the importance of the change explicit to the staff, as well as providing a clear rationale for the proposed changes. They needed to have the confidence to deal with the politics of equity issues, focusing on addressing practices and behaviors that perpetuated inequities, and challenging the low expectations, beliefs, and values of staff toward Māori and Pasifika students and their families. They also needed to be able to manage staff relationships, acknowledge staff concerns about workload, be able to conduct difficult conversations, and provide ample opportunities for discussion, feedback, and consensus building. It was very important for the principal to get support or “buy-in” from all participants (i.e., parents/caregivers, students, Boards of Trustees, and teachers). It was particularly important to get positive support from the majority of teachers and to get them to believe in the effectiveness and importance of the proposed changes. One way to achieve this was by embedding the program aims and activities within the school’s strategic planning process so that it was seen as part of the school’s core business and not an “add-on” or optional extra. School leadership teams were critical in terms of articulating and reinforcing the Starpath rationale clearly.

School leaders needed to communicate the importance of data in diagnosing problems and barriers within their schools and provide leadership in finding locally effective solutions. School leaders were familiar with using summative data (e.g., previous year’s results) to place students in particular curriculum pathways (which often had a deleterious effect on Māori students). However, they had less experience in using different forms of data to probe more deeply into school structures and dynamics that contributed to inequities in outcomes, or to find alternative approaches to current school practices. School leaders also needed to act as role models in respect of reflection, critical review, and questioning past practices. This aspect of leadership was particularly important in engendering trust in the teachers who, initially at least, were reluctant to provide “traffic light” expectations of their students’ achievement or have others monitoring academic progress of “their” students.

School leaders needed to actively participate in professional development with staff, not only in terms of communicating the value of the activity to the school, but also in the acquisition of new knowledge and skills needed to lead the change process. For example, although the principals and other school leaders did not

necessarily need to have the skills to analyze student achievement data or handle the school's Student Management System (SMS), it was imperative that they knew what questions to ask, the capacity of the system to provide the answers, and how the information could be used to influence decisions and practices within the school.

Finally, school leaders needed to provide appropriate support to staff engaged in leading the change and to the school as a whole. One of the challenges for key change leaders has been the perception that, like so many projects in the past, Starpath would be a short-term intervention. There was some reluctance to relinquish any of their senior areas of responsibility in order to have more time for the new roles in data management, target setting, or other aspects of the Starpath program.

Staff and Student Transience

There were numerous changes within schools, and in the wider educational context over time, that impacted on the nature of Starpath's partnership work within schools and influenced student achievement. Some of the Starpath schools experienced significant change within their school leadership teams during the time of the project. For example, 16 schools had a change of principal and in 14 schools there was a change in the Student Achievement Manager (SAM), and often this person was also the Deputy Principal. In some cases, the change in leadership resulted in a strengthening of Starpath partnership work within the school, but in others it weakened the Starpath approach. It was helpful when the new person had prior involvement with Starpath from another school.

A challenge for schools in the project, particularly in the smaller, isolated schools, was staff turnover, recruitment, and retention. Project sustainability was a problem in schools with high staff turnover and this meant that these schools needed a constant re-training of staff. A further staffing problem arose in the smaller and rural schools as they struggled to attract and retain subject specialists. At times, a lack of trained specialists affected the range of courses being offered to senior students and the quality of teaching for senior subjects.

Starpath also had to compete for professional development attention in an environment of multiple interventions, some of which were government funded. Many low decile schools took up additional professional learning and development initiatives to address the multiple issues they faced and to gain extra resourcing. Multiple interventions resulted in intervention overload that caused teacher resistance to change as well as presenting considerable challenges in trying to isolate a Starpath effect (Kiro et al. 2016). Most of the other interventions in the Starpath schools were also targeting Māori and Pasifika students, some, even contrary to an evidence-based approach, with advocacy for interventions with limited evidence, with no appreciation to the local contexts, and not related to the particular diagnoses of issues in the school.

There were also many transience issues among the students. Our analysis found one student who had attended seven different Starpath schools, five students that had attended five Starpath schools, 56 students who attended four Starpath schools, and a

further 757 who attended three Starpath schools. Of the 67,729 students in the database for whom we have school data, 6738 had a non-Starpath school listed as their last school attended over the term of the project. Te Kura Pounamu/The Correspondence School was the most common non-Starpath school, attended by 1753 students. It is concerning that significant numbers of students are moving in and out of schools, and it is clear that more investigation is needed to determine the causes of student transience and the impact on student achievement.

Thoughts on Further Research

Starpath was very successful at increasing schools' awareness, and use, of particular types of data well (demographic and student learning data). Many schools also valued learning how to collect, document and analyze information about how school processes (e.g., subject options, timetabling) impacted student achievement, including collecting perception data from students and families. The key was schools being systematic about the collection of this data and committed to using it to support better learning outcomes for students. There is significant research and development work in appreciating the importance of data in promoting more equitable outcomes for all students, including its use for learning conversations with families, students, and the wider community.

While including quality and comprehensive data in learning conversations with all stakeholders is informative, the actual impact on student learning would be worth further exploration. Schools need to understand what families and students are able to bring to the learning endeavor, and what assistance the school itself may be able to provide. All stakeholders need to understand their role in any initiative – what is each stakeholder's responsibility and what is their contribution?

Another significant area of research concerns being able to shift deficit teacher attitudes and dispositions. There was significant variability in the quality of teaching and interpersonal relationships among teachers and across schools (Kiro et al. 2016). However, it was not uncommon to find condescending behaviors, low expectations, and other problematic dispositions among school staff. Changing or shifting such behaviors is still a challenge for us all.

Discussion and Conclusion

School improvement is complex and difficult at the best of times and the deeper the educational issue, such as the redistribution of opportunity and success, the more resistant it appears to be to lasting change. In their recent review, Cohen and Mehta (2017) have argued that most, if not all, school reforms have fallen short of achieving sustained change *in the longer term*. While there are improvement projects that have been successful, they tend to be narrowly targeted reforms that are protected for a specific time through, for example, extra resources being placed at the school's disposal (e.g., more staff, money) or an initial enthusiasm for the work that then

wanes. Probably most importantly, longitudinal research on tracking educational outcomes beyond achievement scores is not particularly evident. In other words, we still tend to measure “success” for students as just achievement. However, Aotearoa New Zealand is slowly working beyond this with measures of Māori student learning including Māori language, and curricula that recognize and include Māori knowledge and culture (Ministry of Education 2013).

Starpath had numerous successes such as improved achievement at NCEA Levels 1, 2, and 3, and school, teacher, and student perceptions of good outcomes from quality academic conversations. Importantly, we also learnt from our failures, which contribute to an informed evidence-based approach to future interventions. We made assumptions about increasing the numbers of Māori and Pāsifika students achieving the University Entrance Award, which were proven wrong. We were simply not clear enough about how important it was that Māori students achieve UE (the next and ultimate level of schooling in the New Zealand context) if they are to progress successfully onto tertiary-level degree study. We also assumed that by working closely in a partnership with schools, maintaining trust and engaging school principals and senior teachers, we could cascade learning to Heads of Departments and classroom teachers. We came to understand that such cascaded PLD learning is inadequate to the task, requiring more intensive work and translation from senior levels to mid-level school leaders and translation into classroom teaching.

Importantly, Starpath did not sufficiently anticipate the impact of policy changes such as requirements for UE at a national level (e.g., regular changes to the approved subjects list for University Entrance) that often results in dramatic drops in student achievement across all groups, but most of all, among Māori and Pasifika students. Part of the coping mechanism for schools is to encourage students into more “do-able” curriculum such as vocational pathways, thereby deepening the division between low and high decile schools and subject pathways that open up or limit career aspirations for Māori, Pasifika, and low-income students. Ongoing questions need to be asked about whether such practices are likely to widen the inequity experienced by these students over time, rather than reduce them.

While many participants believed that the implementation of two-way academic counseling had a positive impact, analysis of interviews indicated that the effectiveness of the intervention was dependent on the quality of relationships embedded within school cultures, systems, and structures. High expectations communicated through effective, connected relationships between teachers, students, and families were considered key to the students, families, and teachers who were interviewed. Positive and genuine relationships were mentioned by students, families, and leaders as one of the most enabling factors to student academic success. It is important that attention to improved relationships goes beyond the student and teacher. Schools should continue to cultivate a climate in which families feel comfortable to initiate involvement in their children’s education, and should provide them with the appropriate opportunities to do so (Webber et al. 2018). Developing effective academic counseling must be seen as one part of an overall improvement thrust that positions teachers, students, and families as learning partners within the transformation process. During three-way conversations, it is important that school processes and

classroom practices add to family practices and not oppose them, that structured and specific home-teaching strategies are shared (rather than just general advice), and that families have opportunities to be involved in their children's education, especially through informal contact (Webber et al. 2018).

There is little doubt that a schooling improvement program could overcome a lifetime of inequality. Hattie (2016) indicates that attending a low SES school amounts to more than a year's difference in academic performance, and many of the Māori and Pasifika students in the Starpath project had attended low SES schools all their lives. Hattie's (2016) evidence suggested that the educational outcomes for these students are at least a function of their unequal access to key educational resources; in that the lower expectations of these students and the lowered challenges within curriculum choices offered to these students lock them into a cycle of poverty of educational offerings. However, the question remains whether the pursuit of educational excellence is fully compatible with the aim of focusing primarily on organizing an equitable education system (Van den Branden et al. 2011). While Aotearoa New Zealand has some research that suggests that Māori students can achieve well in a schooling system designed around Māori culture, language and values (Bishop et al. 2009), similar success in a mainstream schooling system is harder to achieve. Overall, our analysis has revealed mixed results across Starpath, in terms of impact and effectiveness on teacher/school leader practice and student achievement. Our results indicated that while schools valued the partnership with Starpath and its practical focus on improvement efforts, particularly in using data for teaching and learning, much more intensive work remains to be done.

comprehensive school reform (CSR) limited learning for Diné students and teachers. A contrasting example based in Hawai‘i presents another school’s quest to go beyond generalized research and enact locally tested strategies that were culturally compatible. Unexamined use of research-based interventions can lead to unimpressive outcomes for Indigenous learners and, as seen in the Diné case example, may be actively counterproductive by inhibiting achievement and discouraging deeper learning experiences. Indigenous-serving educational programs are encouraged to build their research capacity and to establish an internal values-aligned system for empirical research that will iteratively inform program development and make it possible to locally evaluate outcomes. Innovative strategies and interventions may then be specifically adapted and tailored over time, to increase their effectiveness within each distinctive Indigenous learning context.

Introduction

In recent decades, many Indigenous communities have invested in creating youth learning experiences that are deeply aligned with their cultural values, leading to a surge in Indigenous language and cultural education initiatives across the globe. With this increasing level of engagement in culture-based learning, more schools are actively encountering the mismatch at the “edges” where conventional Western educational structures bump up against the modern evolution of traditional cultural forms (based on time-honored values and practices). New approaches to Indigenous education emerge when cultural practitioners, parents, and teachers navigate the challenging waters of Indigenous learning in the twenty-first-century context (Johnson 2013). At the same time, scrutiny by educational establishments has tightened the reins on what is possible for Indigenous learning communities in some nations and states (Jimenez-Silva et al. 2014; Charters and Stavenhagen 2009).

As Indigenous education and culture-based education grow and reinforce the base of evidence and support for these community-directed and values-driven programs, it becomes more and more important to ensure that, across the diversity of approaches, there is room for meaningful learning and valuable performances. At each gathering of the World Indigenous Peoples’ Conference on Education, we hear narratives from tribes and nations using learning programs as pathways for cultural healing and knowledge development. Well-aligned educational programs present opportunities and support for recovery from collective historical trauma, and they serve as a testing ground to understand how to sustain Indigenous knowledge in the global context that technology presents us with daily.

Many Indigenous communities have traditionally assured high quality of learning through an emphasis on personal relationship with the learner (Chun 2011) and by relying upon a deep trust in the natural unfolding process of human development and

learning as part of life itself. Western institutions have ensured quality at high volume through standards and standardization. In the United States, for instance, many departments of education have adopted sweeping reforms based on uniform standards, such as the Common Core State Standards and Next Generation Science Standards. Legislators, business leaders, and accreditation bodies have deemed these standards to be broad enough to accommodate all students and their contexts, fueling massive national-scale curriculum adoptions that suppress local community-level decision-making about how to incorporate locally valued knowledge and competencies.

Interpreting national standards in teaching practice requires that a new base of curriculum and strategic pedagogy be established at every school, integrating community knowledge and values – this takes time, values-alignment, recursive improvement, and strategic reflection on the part of educators, students, and community stakeholders, as they work through the challenges and contradictions that this new politicized atmosphere presents. Developing meaningful learning experiences while balancing all of these expectations means that Indigenous education advocates must actively respond to these mandates to reach newly announced Western standards and utilize scientifically researched practices, as they pursue their long-term goals of cultivating Indigenous knowledge systems that carry on for millennia (Nelson-Barber and Trumbull 2015).

For a long time, coercive institutional systems and Western research conventions have shaped our use of and attitudes toward certain types of practices, creating reluctance within Indigenous communities to conduct even locally directed research using “accepted” methodologies (Smith 2013). We observe in this study how interventions recommended as best practices on the basis of research from other contexts can have inhibitory effects on Indigenous learning because of unique contextual and historical factors. We encourage doing more research on the impact of practices within our own Indigenous communities, even as we recognize that it is not a simple transition to overcome barriers or to find the resources to improve practice in this way. While it takes a higher level of investment to evaluate the impact of new practices, that extra time and the growing community capacity for research provide valuable returns by deepening understanding of what works for today’s learners and making learning experiences better adapted to context – all while increasing community power for self-determination.

Overcoming historical resistance to research is a significant milestone, both in terms of community attitudes and when it comes to building the capacity to design, conduct, analyze, and apply the findings of local research. Much of what goes on in culture-based education is being tried for the first time, having been adapted from other programs or revised and “remixed” to fit the local setting. Indigenous educators can observe patterns and adjust on a case-by-case basis; however the students and the new programs benefit when they can demonstrate to themselves and to the community that the practices in use are furthering the kinds of results their communities value. A new level of self-determination can be reached when communities develop capacity for evaluating educational practices, establish their own meaningful standards of evidence, build familiarity in using data for program improvement,

and gain awareness of the preferred research methodologies that make sense within their own community and heritage culture.

Empirical data and evidence-based findings from the general population may help us identify educational innovations and emerging technologies, and locally conducted research can help us refine them over time to respond to unique community contours and contexts that change from year to year. Typically, the findings of large-scale educational research are interpreted to mean that a particular practice can be generalized to the full matriculating population. The vast variability in the ways that interventions can influence specific populations is illuminated in this chapter's two case examples.

Since 2014, we have collaborated with Diné (Navajo) educators as part of an ongoing project associated with WestEd's West Comprehensive Center and with a university program for teacher professional development. Through that research effort, we saw directly and heard from our participants how scientific research is being applied ineffectively – leading to results for Indigenous learners that were limited in benefit and may have been actively counterproductive by discouraging deeper learning experiences. The case example exemplifies some of the factors, reasons, and situations that can cause research-based findings to be glaringly ineffective and even inhibitory to learner achievement.

The second case example comes from one of the authors' firsthand experiences and describes how a Hawai'i learning community responded to the pressure to use scientific research in Indigenous learning. It explores how broad variations in learner populations demand additional layers of reflection and study before it is possible to know whether a research-based finding will be effective for a specific setting, will be detrimental in that setting, or may be modified in a specific way in order to become effective.

It is critical for educational institutions and governmental organizations to utilize diverse assessment strategies and apply multiple perspectives as they learn to attend more closely to the power of contextual features when forecasting the potential effectiveness of a proposed intervention or innovation for a particular community or set of learners. We hope that this chapter will reinforce Indigenous educators' skepticism of the particular research-based innovations in use at their schools or in their communities and inspire them to undertake local research investigations of those practices.

Background

Why Challenge “Best Practices”?

The move to adopt uniform educational standards across the United States has narrowed prospects for many schools to shape programming that is responsive to many of the distinct contours that influence student needs. Learning communities of all types look to the field of educational research for advice and direction about what is likely to benefit their students; sponsored adoptions like computer-adaptive assessments that promise higher student scores on state tests are popular choices backed by research that shows their effectiveness for many.

Increasing reliance on the scientific study of educational practices has grown since Thorndike's early forays into standardization and was legislatively enshrined in the United States in 2001 with the passage of the No Child Left Behind Act (NCLB), which only supported the use of practices that were backed by randomized, controlled scientific trials. The effects of this legislation have been multilayered and strongly negative for Indigenous learners (Balter and Grossman 2009; Castagno and Brayboy 2008; Winstead et al. 2008), yet evidence-based criticism of the national NCLB policy has had little impact on its application in schools. Cultural psychologists have noted that most interventions have considered only the values and norms of the dominant, middle-class, White culture in their investigation of best practice (Niles et al. 2007). In turn, norms of practice and testing are established that do a disservice to both the scientific inquiry process and to non-dominant students who must stretch beyond their cultural repertoires to adapt to such unfamiliar norms (Medin and Bang 2014; Gutiérrez and Rogoff 2003).

Indigenous scholars like Megan Bang, Bryan Brayboy, and Greg Cajete reach farther in their critique, arguing that it is vital to challenge the widespread view that scientific research can truly be objective and discouraging of bias. Medin and Bang (2014) assert that the process of scientific inquiry mirrors and replicates culture-specific beliefs – through the questions it poses and funds – and that this invisible bias is explicitly damaging for Indigenous populations who have diverse reference points for making meaning.

While the trend of reliance on testing and narrow evaluative criteria continues, despite the knowledge that it may harm some learners, there is little agreement among scholars as to whether scientific research can even appropriately be conducted and applied in educational environments. As asserted in the National Academy Press volume *Scientific Research in Education* (Shavelson and Towne 2002, p. 1), “[T]here is long-standing debate among scholars, policy makers, and others about the nature and value of scientific research in education and the extent to which it has produced the kind of cumulative knowledge expected of scientific endeavors.” This professional dispute continues in part, because study and application of variables and interventions in educational settings cannot truly be controlled as there are so many contextual factors and nuances in any ecology of learning (Lee 2008). The newest iteration of US education legislation – the 2015 Every Student Succeeds Act – emphasizes locally controlled data-based decision-making in lieu of scientifically based research in education, yet little has changed in practice. Though questions persist about the validity of tinkering with variables to intervene in educational contexts, the issue of cultural validity is not yet recognized as central in that overall debate outside of Indigenous communities.

On the Value of Indigenous Knowledge Systems and Practices

The question of “what to do” about school is particularly salient for Indigenous community members because they are the bearers of distinctive sets of traditional cultural practices and languages, known as Indigenous knowledge systems

(Barnhardt 2014; Barnhardt and Kawagley 2005; Denzin and Giardina 2016). These systems are vulnerable to disruption in the modern era, largely due to histories of colonization, assimilation, and cultural trauma that complicate the ways that knowledge is passed from generation to generation; educational contexts can stand in the way of or support the transmission of these Indigenous knowledge systems.

Often, when we discuss the sensitive nature of Indigenous education initiatives, people have questions like these: How do we know that Indigenous approaches to learning are valuable? What makes Indigenous knowledge systems so unique? Why should we protect Indigenous communication styles and heritage practices? How is culture-based learning related to cultural perpetuation of these Indigenous knowledge systems? There is a wealth of scholarly writing on these topics, and we want to emphasize three key points regarding the inherent value of Indigenous knowledge, to remind readers of the scope of harm that is done when Indigenous knowledge systems are subducted under the mainstream of scientifically researched best practices:

1. *Knowing and interpreting the world, by offering a distinct set of claims about valid and valuable knowledge as a foundation for worldview and epistemology.*

Indigenous people who participate in their heritage culture as well as the dominant Western culture understand both the similarities and the vast differences between the worldviews and epistemologies that each one holds as true – this involves more than just different ways of speaking, eating, or dancing (Battiste and Henderson 2000). The research base has shown for some time that one's worldview influences how one interprets and ascribes meaning to phenomena, decides what is valid and valuable knowledge, and interacts with others in relationships (Meyer 1998, 2003; Smith 1998, 2013; Whorf 1956). Indigenous knowledge systems also influence the language used in a given moment, and patterns of communication, as well as preferred learning styles within the classroom and in the family (Demmert 2001; Deyhle and Swisher 1997; Labov 1972; Lomawaima and McCarty 2006; Nelson-Barber and Trumbull 2015).

2. *Communicating and constructing language that reflects land, relationships, and personal identity.*

The legacy of assimilative education has decreased the number of speakers of most heritage languages, endangering the fine-grained conceptual understandings, relationships, and implicit patterns that are embedded in the metaphoric structure of language. Independent of the words spoken, it has long been understood that Indigenous learners have distinctive interactive styles in their cultural repertoire that can be called upon as bridges to learning (Cazden et al. 1972; Delpit 1995). Often in school, those styles are pushed to the margins in favor of more broadly accepted styles that teachers are encouraged to use or more comfortable with (Ladson-Billings 2014a; Phillips 1983). Understanding how students communicate at home, in the family, and in informal interactive environments brings insights on how communication can be organized in small

groups, how teachers facilitate discourse, how youth respond to teachers, and so forth (Nelson-Barber and Dull 1998; Scollon and Scollon 1981; Aronson and Laughter 2016).

3. *Making sense of the unfamiliar through familiar protocols for listening and learning and through interactional patterns that are common in their home environments.*

Using Indigenous knowledge systems, learners develop repertoires of practice that help them function effectively as they make sense of real-world experiences like calculating the size of a rack for drying salmon based on the catch size, predicting a sudden weather change, or solving a technical problem on a canoe with the materials available while on the water. Knowledgeable teachers can successfully use cultural patterns in teaching when Indigenous styles are recognized and accounted for. Building on Indigenous ways of knowing and doing connects prior funds of knowledge (González et al. 2005), boosts cultural identity (Purdie et al. 2000), and makes a positive difference on conventional measures of achievement for Indigenous students across different types of schools (Kana'iaupuni et al. 2010, 2017; Lipka et al. 1998; Lipka and Adams 2004; Solano-Flores and Nelson-Barber 2001).

Indigenous knowledge systems prime young people for learning through distinctive types of experience, and it is essential that educational programs not deny them access to their principal means of sense-making in school. There are well-known ways that schools can sustain Indigenous knowledge systems when conducting culture-based education, offering experiences that evoke the prior knowledge that learners are primed with through their repertoires of practice in Indigenous community. These ways are widely used among culture-based educational programs and include methods like the following:

- (a) Use of culture-based ways of interacting and communicating, such as peer-regulated participation in a discussion (Eriks-Brophy and Crago 2003; McAlpine and Taylor 1993)
- (b) Use of culture-based ways of learning, such as observation and side-by-side modeling rather than face-to-face telling (Lipka et al. 1998; Lipka et al. 2007; Swisher and Dehyle 1987)
- (c) Use of culture-based ways of representing knowledge or organizing information, such as through visual means and relationally or holistically (Tharp 1989; Kirmayer et al. 2011)
- (d) Use of strategies that allow for flexibility and student choice, such as thematic and project-based instruction (Lipka and Adams 2004)
- (e) Use of culturally compatible ways of assessing learning, such as through demonstration or group performance (Bailey and Carroll 2015; Nelson-Barber and Estrin 1995; Swisher and Deyhle 1987; Trumbull et al. 2015)
- (f) Incorporation of the ethical dimensions of mathematics and science and their historical origins (Ernest 2009; Mukhopadhyay et al. 2009)

When strategies like these are not present in formal learning environments, the transmission of cultural patterns and Indigenous knowledge systems is disrupted. Rather than supplanting culturally compatible experiences with scientifically research-based interventions, these strategies can be used for the benefit of student achievement, without degrading the values and practices embedded within an Indigenous knowledge system. Use of the strategies described here supports the kinds of culturally sustaining and culturally revitalizing pedagogy that McCarty and Lee (2014) deem essential for movement toward Indigenous education sovereignty (see also Paris 2012; McCarty 2002).

Case Examples

In the section that follows, we present two contrasting case examples of communities responding to the pressure to use scientifically based research for formal education in Indigenous contexts; the first case comes from Diné (Navajo Nation) public schools in Arizona and is based on conventional qualitative research methodology. The second case comes from a Hawaiian (Kanaka Maoli) place-based charter school in Hawai'i and is structured as an informal narrative relating the personal experience and reflections of one of the authors. The case examples differ not only in terms of method but also in school approach. Schools in the Diné case example generally had very little flexibility in curriculum selection; in the Hawai'i case, the school exercised its self-determination, electing not to rely on outside research and pursuing a path that fulfilled community aims beyond simple achievement on tests.

Context for the Diné Case Example

The stakes are very high for Indigenous communities like those of the Navajo Nation when it comes to improving educational outcomes. As seen close-up through the eyes of teachers in this case, language shift away from the heritage language has fundamentally changed the texture of Diné communities in a very short time. *Diné Bizaad*, the Navajo language, is much less widespread than just one generation ago, due to schooling, assimilation, language shift, and limited intergenerational interactions (House 2005; Fish 2017).

Conventional education programs have been a key leverage point in disrupting cultural patterns, by chipping away at the strong complex of Diné language, interactions, and practices and replacing them with experiences that interrupt natural learning processes and familial relationships, as well as discouraging future growth because learning is equated with negative school experiences.

The Diné culture and language teachers in this study have been fashioning curricula and pedagogical processes to be compatible with their linguistic contexts, and over several years we have observed them successfully implementing culture-specific modifications, as well as how their desired practices are constrained by

school mandates regarding factors like language use, scheduling, and travel in the community.

As researchers, we sought to understand which aspects of culture-based education and Indigenous knowledge development were clearly working to further academic achievement among American Indian students. Initially, we selected STEM education as the focus of our exploration because we know that many Navajo children experience culturally embedded, community-based mathematics and science education from an early age that builds their awareness of the distinctive place-based Indigenous knowledge system. Due to the value that Diné give to observation of their natural environment and spiritual connection to the land, children engage with distinctive *ethnomathematics* and *ethnoscience* knowledge directly through community practices (processing plants for medicinal purposes, managing livestock and farming, storytelling about constellations and origins, etc.). While our initial research aim was to identify the kinds of pedagogical practices that teachers found effective for Navajo learners in STEM education, our use of Indigenous research methodology (Kovach 2010; Smith 2013) led us to revise our inquiry to focus on the Diné teachers' central question: How can we begin to understand and address the institutional-level constraints and "best practices" that interfere with the cultural integration that we know benefits students?

We interviewed 30 teachers and administrators (in individual and focus group settings) from 18 schools in Diné communities. During the course of these interviews, we noted that teachers did not separate specific ethnomathematical and ethnoscientific practices (that might commonly be labeled as STEM learning) from the comprehensive domain of "culture teaching" as they referred to it. Due to this pattern in their way of thinking that did not draw a disciplinary separation, we decided to expand our inquiry to focus on the locally defined practices that they felt were most important for Navajo learners' success. We applied qualitative analytical methods to the large body of data gathered through classroom observations, interviews, and the use of a talk-aloud protocol for prioritizing practices identified by the group.

Throughout the process, we heard the teachers share numerous examples of how schools were failing their Indigenous student populations – even though teachers were adhering to required research-based solutions promoted by the state and the district (DeGroat et al. 2015). Attempts to follow externally mandated policies were not reliably helping Indigenous learners to thrive in formal schooling environments, and the Diné educators in this study wanted their voices and views to be heard, with the aim of improving their community's success. Historically, research has been viewed as extractive in Navajo communities (Kelley et al. 2013; Gaudry 2011), yet these teachers contributed openly, explaining their desire to inspire changes and to contribute to a broader understanding of what excellent teaching and learning may look like across the domains of multilingual and multicultural settings.

We selected the case example that follows to show some of the ways that these scientifically tested, government-recommended strategies are not serving Indigenous students as effectively as the research suggests. This two-part case highlights the interwoven effects of these patterns and how "best practices" can negatively affect learners as individuals and also the teachers who strive to adopt school reform.

Diné Students and the “Best Practice” of Comprehensive School Reform

In the United States, the adoption of comprehensive school reform (CSR) programs accelerated from the early 1980s through the early 2000s, boosted in the mid-2000s under the No Child Left Behind Act’s pressure to raise test scores with research-based practices. These schoolwide programs aim to increase student achievement on specific summative assessments and typically include precisely scheduled curriculum materials, along with formative assessment tools and a suite of scientifically based research strategies and practices – all targeted to help learners reach state standards for performance.

However, research results regarding the positive effects of CSRs on student achievement are uneven (Vernez et al. 2006; Slavin 2007). A 2002 meta-analysis revealed that only 3 of 232 studies of CSR programs showed strong evidence of student improvement on conventional measures (Borman et al. 2003). Still, they have emerged “as a policy instrument supporting improvement in American schools” (Rowan et al. 2004, p. 2) – one that is part of the US educational lexicon and here to stay. Nationally, schools and administrators continue to adopt and utilize CSR programs, but scholars are still debating whether CSRs are in fact effective for diverse populations.

Many decision-makers in education believe that highly structured instructional approaches like those in CSR programming are the best medicine for “at-risk” children (Ede 2006) or those in high-poverty schools (Aladjem and Borman 2006). These students are thought to require more structure and “basic skills,” compared to the “expansive curricula and innovative pedagogical strategies” often available to elite students (Ladson-Billings 2014b, p. 7). Statistics show that linguistically diverse, culturally diverse, and low-SES students who are “at risk” for educational underperformance are more likely to attend schools with CSRs (Aladjem and Borman 2006; Fixsen et al. 2013); still, the research is not clear that these programs increase achievement among diverse students.

Independent of the quality of CSR implementation, there are easily identified reasons why Navajo students may be less likely to benefit from the “best practices” in this type of reform than the general population. The approaches of Nizhóni and Janelle, two Diné teachers in high-performing upper elementary classrooms, illustrate some of the relevant factors at play. The first teacher, Nizhóni, follows a CSR program in which she controls the pace and tone of all activity. Student desks are arranged neatly in rows. The walls on all four sides of the room are filled with prepackaged materials on “place value” or “parts of speech,” each linked with the textbooks and worksheets assigned to learners. During instruction, students are quietly attentive to Nizhóni and focus on the spelling and vocabulary word lists she presents; for the most part, the classroom is silent, with the exception of the directives of the teacher’s cues and the students’ choral responses. Nizhóni’s seven- and eight-year-old students are making excellent strides in test performance, yet classroom activities are so regimented that they must master a passive approach to learning if they are to attain success.

According to Giroux and Penna (1979), the quintessential virtue learned by students under these conditions is patience (i.e., not a patience rooted in mediated restraint, but one that is rooted in an unwarranted submission to authority). “They must also, to some extent, learn to suffer in silence. They are expected to bear with equanimity, in other words, the continued delay, denial and interruption of their personal wishes and desires” (Jackson 1968, p. 18).

At another school, the classroom of the second teacher, Janelle, is abuzz with activity among her eight- and nine-year-olds. Students cluster around group tables and beanbags doing small group and individual work based on their needs and personal workflows. Periodically, Janelle calls learners together for a whole group focus, projecting maps and images on a digital screen and asking questions that build to progressively higher levels of cognitive complexity on a geography topic. Students return to their independent and small group tasks, and slowly the volume in the room rises; about 10 min later they are called together once more by the teacher who uses hand signals to facilitate a transition to the next activity. Using only gestural feedback, and aided by the props of a yellow circle and a green square cut out of cardboard, the students follow a spontaneously unfolding routine as they move around the room, demonstrating their knowledge of the Navajo language in flexible ways. Each one of the visual prompts and gestures provided by the teacher invites students’ extemporaneous oral responses in *Diné Bizaad*. They use the hand signals Janelle introduced, and after several minutes she steps away, allowing an impressive orchestration of movement, language, and color to unfold as students enact their knowledge.

As Janelle’s students engage in independent activity and produce authentic work products and performances to exhibit their learnings, they are developing communication, flexibility, self-regulation, metacognition, executive function, creativity, critical thinking, and other twenty-first-century learning skills (Partnership for Twenty-First Century Learning 2015; Jenkins et al. 2009; Marulis 2014). Honing these abilities sets them on an educative path toward future understanding that promotes future learning and growth as creators of knowledge (Dewey 1938/2007).

The pattern of learning set by Nizhóni in the CSR classroom primes students to absorb information in response to explicit visual and aural cues that tell them directly which information is important and what they do not need to attend to. Rather than learning to discern what is most relevant for the task at hand, they learn to pay attention to whatever content the teacher directs them to focus on. One result is Nizhóni’s observation that students in her schools’ CSR classrooms tend to perform well on tests that immediately follow the associated scripted and repetitious activities, but fall short on tests requiring long-term memory of the same material. In both Janelle and Nizhóni’s classes, we see high scores and relative score increases over the year, yet because of bias within the state assessment system used at both schools (which prioritizes shorter-term test results over longer-term applied outcomes), the two sets of students appear similar, even though the capacities they are building differ substantially.

This fundamental contrast between the patterns of learning in Nizhóni and Janelle’s classrooms is part of the contested nature of schooling in Indigenous

lands. The CSR program may indeed benefit Diné students' test scores, but can it justly be considered as a "best practice" when it is so mismatched with the repertoires of practice understood by Indigenous learners and expected within their own homes and communities.

The Diné culture and language teachers in this study explained repeatedly, in numerous ways, that learning in the Navajo way promotes autonomy, observation, demonstration of knowledge, and shared responsibility and emphasizes longer-term values and character over shorter-term results. Young learners develop knowledge and skill through repertoires of practice that give them the right (and ample encouragement) to test what they know in practice – and making repeated attempts to show mastery in independent performances. Such opportunities form important resources for cultural and economic survival, yet the research-based "best practice" model in Nizhóni's CSR class forecloses on the learner's ability to develop this kind of valued knowledge through school-based experiences. The cultural way of learning goes uncultivated in such a classroom, and students learn that the qualities of personal vigilance and discernment that are so important at home can be considered a distraction or liability in the teacher-regulated class. If conditions are right within the school, student test scores may go up with adoption of a CSR, yet this cultural difference in ways of learning was never considered as a relevant variable in the gold-standard controlled research trials that inspired the adoption of the CSR as a "best practice."

As Janelle demonstrates through her students' independent proficiency, school can be a lively place of restorative learning when "best practices" are locally examined and adapted to discourage what Dewey (1938/2007) calls "mis-educative" learning. He asserts that external regulation and overuse of drill-like methods causes learners to become "callous to ideas;" they lose "the impetus to learn because of the way in which learning was experienced by them" and become limited "in their power to act intelligently in new situations" (p. 25).

Diné ways of acquiring knowledge are reflected much more in Janelle's approach which flows between learner-directed and teacher-guided modes. Even when teacher-guided, the style Janelle uses is compatible with students' existing repertoires for communicating and interacting with others – she extends their capacities, inviting them to use their social-emotional learning proficiencies to propel further collaboration and knowledge production in applied ways.

Giving youth opportunities to make decisions about how they delegate their attention is a key to literacy in the modern digital age as well as in the cultural contexts of Navajo life. The self-regulation and discernment skills that students practice in Janelle's class contribute to each learner's basic foundation for personal self-determination and their construction of personal agency in the process of collective self-determination.

This difference between Diné ways of acquiring knowledge and the embedded "best practices" of the CSR approach is particularly salient in places where generations are recovering from colonization, genocidal histories, and personal trauma. For the majority of Indigenous peoples, exercising the right to self-determination is at the core of critical issues in language revitalization, cultural vibrancy, and collective and personal survival (Kirkness and Barnhardt 1991, 2001).

Students who learn through the research-based “best practices” of comprehensive school reform programs internalize a “hidden curriculum” (Bain 1985; Giroux and Penna 1979; Jackson 1968) that predisposes them to passivity rather than providing them with tools for self-efficacy to counteract the social and historical forces at hand. While district leaders and administrators at Nizhóni’s school believe that adoption of the CSRs is in alignment with “best practices,” this case shows clearly that, even if test scores rise, CSRs are not well fit for learners in Indigenous communities. The legacies of genocide, dislocation, resource extraction, and aggressive assimilationist policy require young Native students to cultivate practical skills for personal and collaborative self-determination if their heritage is to thrive now and continue into the future.

Diné Teachers and Comprehensive School Reform

In recent decades, there has been a push to promote teachers’ “fidelity” in the implementation of curricula and programs, as a best practice in support of student learning. In 2018, the national conversation in the United States still frames teachers as technicians who are charged with delivering prepackaged information (Ingersoll and Perda 2008; Crosland and Gutiérrez 2003; Labaree 2004), far more than as adaptive professionals, like doctors or psychologists (Shulman 1986a, b, 1987, 1992), who make decisions about what, how, and when to teach, based on a host of nuanced factors. Technician-like teachers make a diagnosis and deliver a corresponding solution – unlike professional practitioners who are daily called upon to demonstrate “cognitive flexibility in ill-structured domains” (Shulman 1986a, p. 24) as they generate pedagogically diverse supports for students.

One result of the narrowing definition of effective teaching and deprofessionalization of teachers (Crosland and Gutiérrez 2003; Darling-Hammond and Bransford 2007; Gordon et al. 2006) has been a shift of focus onto curricula and programs that, in the short term, increase student test scores when implemented consistently; this pressure disproportionately impacts schools with low test scores and low SES (Gorski and Zenkov 2014). A substantial body of research urges teachers’ strict adherence to specific guidelines to achieve “fidelity of implementation” in curriculum and programs, as a way of assuring impacts on student learning that approximate the measured gains shown in research trials (O’Donnell 2007, 2008; Lynch and O’Donnell 2005; Mowbray et al. 2003; Rowan et al. 2004).

As Vernez et al. (2006) observe, “very few schools have fully implemented their reform model... At the current level of implementation, comprehensive school reform is likely to have little effect on student achievement” (p. 1). The presence of strategies to assure fidelity is thought to be able to tip the balance, helping the heavy reform investments made by schools lead to greater returns in learner achievement.

School administrators across the United States and in the Navajo Nation strive to focus on fidelity of implementation, yet in Navajo communities, we observed Diné educators coming together around a wholly different set of solutions and questions in

their quest to make a positive difference in the urgent life circumstances of their students. Rather than investing in the school's CSR programming more deeply, the Navajo teachers in this study are looking to address what they identify as the root of the problem:

We're coming up with a plan: What should we do to help Native students? Why is it that every year professional teachers, highly qualified, get credentialed, come to the reservation – but what's happening? Students are labeled ESL or ELL; does that mean that they're dysfunctional [and] they can't learn? Or, do we need to revamp our curriculum? [No, it's]. . . because our students already are in that trauma. They're living that historical trauma all over again, but it's [happening this time] through mandated standards and assessment.

While the research on the impacts of cultural trauma on educational outcomes is somewhat limited, there is substantial agreement among scholars and educators with cross-cultural knowledge of Indigenous community histories that cultural trauma does indeed play a key role in inhibiting learner success (Brown-Rice 2013; Gray and Beresford 2008; Battiste et al. 2002; Kirkness 1995; Benham and Heck 1998). All but one of the 30 Navajo educators in this study expressed an explicit critique of today's increasingly standardized innovations and unyielding curricula, pointing out that whatever "best practice" that is currently in vogue, from the comprehensive school reform model to the literature circle, may be beneficial – yet something fundamentally stands in the way of Navajo learners' progress: cultural trauma.

Loss of language, loss of land, loss of family structure and kinship relations, and loss of personal and group self-determination together form a fundamental wound for members of many Indigenous communities, interrupting pathways to well-being and to educational access (Kirkness 1995; McCubbin and Marsella 2009; McCubbin et al. 2008; Salzman 2001; Stamm et al. 2004). As noted by Brown-Rice, a leader in the counseling field, "The primary feature of historical trauma is that the trauma is transferred to subsequent generations through biological, psychological, environmental, and social means, resulting in a cross-generational cycle of trauma. The theory of historical trauma has been considered clinically applicable to Native American individuals" (Brown-Rice 2013, p. 117; Sotero 2006; Brave Heart et al. 2011).

This fact is reflected in elementary teacher Luella's articulation of how cultural trauma isn't just something from the past; it continues to affect the youth in her community:

It's already happening now. A lot of our students right now, they don't have that self-identity because...they chose to, or they didn't really have a choice; they were forced, maybe through [economics] – their parents moved to the city – and they had to move away from the actual home structure, and so there they're addressing the pain from the loss of language, loss of tradition, culture, identity. . .

Diné students who continue to experience the weight of historical and current cultural trauma will remain unable to benefit from even the most promising educational practices. The encompassing pain of intergenerational cultural trauma is a rarely addressed and

profound obstacle standing in the way of learner success. Diné study participants strongly articulated the view that a new kind of colonialism is being visited upon the students through the control of externally directed education programs that fail to account for and accommodate cultural differences and community-specific needs within the student population (Brown-Rice 2013; Kirkness 1995). Twenty-nine of 30 participants identified *cultural integration* as an essential strategy required to reduce the effect of cultural trauma as a barrier to learning.

These Navajo educators are suggesting that schools and teachers that focus on “fidelity of implementation” as a central best practice (in response to external expectations, language policies, and pressures to reach test score benchmarks) are missing a key opportunity to reach Diné learners through the integration of culture, which has been shown to contribute to personal and community healing from historical cultural trauma (Goodman and West-Olatunji 2010; Fast and Collin-Vézina 2010; Evans-Campbell 2008; Salzman and Halloran 2004; Brave Heart and DeBruyn 1998). Well-being researchers McCubbin and Marsella (2009) affirm Indigenous cultural integration as a strategy for healing from cultural trauma, noting a direct relationship: “How well these Indigenous populations negotiate their way through the dominance of the Western culture is determined, in a large part, by an understanding and revitalization of Indigenous knowledge and its application and integration into research and clinical practice” (p. 386). These researchers have high confidence in the power of using Indigenous knowledge explicitly to promote psychological and physical healing in their domain; why not explore its use within educational contexts? In Navajo communities where many teachers have a deep understanding of culture and language traditions, learners lose out on the power of cultural integration when educators are pushed to maintain fidelity to externally driven programs that leave no place for heritage practices.

Teachers who understand the language, Indigenous knowledge systems, and traditional ecology can provide valuable connections that help bring learners’ fluency in local traditions together with globally valued literacies. Yet teachers’ adaptation to the context (Johnson 2013) is broadly constrained when the “best practice” of fidelity in implementation is held as a central school goal. Whether through aggressive content controls, time constraints, or explicit censure, teachers with cultural knowledge are often prevented from using what they know to reduce the barriers to learning that cultural trauma presents. Many Indigenous teachers interpret and adapt externally prescribed “best practices” in ways that are highly context-sensitive – they incorporate students’ worldviews, build new concepts on learners’ prior experiences the past season, and actively make use of influencing factors like familial or clan relationships (Kana’iaupuni and Kawai’ae’a 2008; Roppolo and Crow 2007).

In their study of teacher practices in Native Hawaiian culture-based education schools, (Kana’iaupuni & Ledward 2013) find:

The evidence indicates what may translate into a “double win” for children in culture-based environments. Specifically, the data suggest that in culture-rich environments, *teachers go above and beyond conventional best practice to achieve relevance, relationships, and rigor,*

delivering highly relevant education via culture-based strategies *in addition to* the body of teaching strategies known as best practice. (p. 154)

Given professional freedom and community support, the Indigenous teachers in the Hawai'i culture-based learning achieved outcomes better than the "best practices," by interpreting content and pedagogy in context-adaptive ways.

One difference between those settings and the Diné schools we observed is that most of the schools in the 2013 report are community-based public charters or independent schools – settings where teachers have the freedom to make pedagogical choices that are culturally aligned, to change schedules for travel to place-based cultural events, and to adapt content in ways that are appropriate for their local community. Diné teachers in this study were rarely supported with such pedagogical and structural freedom, and, as interviewees frequently reported, many are banned or discouraged from using Navajo language in classes (other than culture class) and among themselves.

Kee, a middle school culture teacher, is an exception; he has worked with his principal to secure permission to take students outside the classroom to local areas where family ethnoscience practices are conducted, as well as farther out to *Dinetah*, the birthplace of the Navajo people, where cultural sites serve as a foundational bridge to science learning. While Kee's community connections and cultural expertise make these journeys opportunities for deep learning, these are neither "field trips" nor simply extracurricular activities. *Place-based learning* is a means of relationship development and identity construction; youth are socialized into the practices, stories, timing, skills of observation, ceremonies, and prayers – all associated with key activities, seasons, and significant places (Basso 1996; Maryboy and Begay 2010). Within any Indigenous worldview, the acquisition of practices, language, and understandings through lived experiential activity is fundamental to forming and linking deep interconnections over a lifetime. Immersion in meaningful relationships and purposeful activity create knowledgeable participants who grow up to value and perpetuate Diné culture over the long term. Kee uses place-based teaching and traditional Navajo learning strategies (like letting students practice independently before sharing) in his science classes because he recognizes that science becomes more meaningful to students when they can make clear connections between the subject matter, their cultural understandings, and their lived experiences.

Marvin, an elementary-level Diné educator, faces a different set of circumstances: he holds his language classes in a hooghan (an eight-sided traditional Navajo dwelling facing east) on his campus. He highly values the teaching of language and culture, yet Marvin finds himself constrained by a class period system which allows about 20 min to interact with developing learners aged four through 10. Despite the fact that language learning has a positive "connecting" impact for learners across all content areas (Tibbetts et al. 2007; Kana'iaupuni et al. 2010; Balter and Grossman 2009), and Marvin asserts this virtue at every opportunity, he is still locked into a rigid class schedule that cycles students through with far too little time for cultural activity and relationship building. This arrangement forces him to

select a bare minimum of language content and rules out opportunities for him to infuse pedagogies that are orchestrated in a culturally sustaining way. In his words, he feels “trapped” in the healing place of the hooghan, where he is coerced into teaching in ways that run contrary to the heritage practices that he knows will best foster well-being and extend learning for his community.

The school’s choice to prioritize fidelity in implementation of their schoolwide program means there is very little space for him to activate his vast expertise, incorporate the language he is so passionate to share with students, and accomplish the cultural integration that he knows will help them face cultural trauma with resilience. Incorporating these Diné educators’ expertise into school programs is a critical step in beginning to address the legacy of colonialism and cultural trauma that shadows the lives of today’s learners. Shifting school priorities toward adaptive cultural integration and away from fidelity in implementation does not herald the end of collecting data on student learning or ongoing program monitoring/evaluation activities. Rather, it creates opportunities for teachers with solid grounding in an Indigenous knowledge system to step forward and lead as context-adaptive professionals – addressing imminent challenges by making use of iterative tools like action research to make sense of local context and to persist in selecting the strategies that are truly effective at addressing learner needs for each point in time.

Prioritizing teacher voice for cultural integration (and, where possible, flexible allocation of resources for things like transportation) may require significant restructuring of leadership models and schoolwide expectations; such changes are likely to be profoundly fruitful when conducted in alignment with local community values and existing cultural models. Drawing forth the expertise latent within cultural, community, and family institutions fills a critical void in the educational system by informing and directing school efforts to literally *bring in* a broader range of the knowledges and relationships that matter for learners (González et al. 2005). Whether local communities face historical cultural trauma or other challenges like economic vulnerability and resource extraction, each place has unique contours that influence learners’ needs; these must be considered through adaptive use of evidence-based inquiry to inform the selection, adoption, and interpretation of best practices with locally proven effectiveness.

Diné Case Summary

This case example illustrates how the “best practice” of comprehensive school reform was not a good fit for students and teachers in the Diné context, because the CSR model stood in the way of the practices and strategies that the Indigenous community and culture teachers find to be most essential in addressing cultural trauma and developing student capacity for agency and self-determination. Diné teachers prioritized balanced integration of Navajo cultural experiences, opportunities for heritage language use, and purposeful learning – yet the research-based CSR program model yielded little room for their innovation or application of these known strategies.

Building capacity to locally research the effectiveness of new strategies for attaining outcomes that are valued by the community is one step that could help in proving the need to transition away from externally defined best practices. With a process for selecting and testing new strategies that may appear to have beneficial potential for their students, Diné teachers can begin to identify and measure practices that are truly impactful and effective, rather than simply adopting and implementing strategies that work for others, without exploration of how they function locally.

Hawai'i Case Example

The following case example shares a story of how teachers at a new Indigenous culture-based school chose their first literacy curriculum; it is a first-person account, told from the viewpoint of one of the authors, as she experienced it.

My community in Hawai'i was extremely dissatisfied with the educational outcomes for Hawaiians (Kānaka Maoli) that were normal for graduates from the public school system in our area. Working at a hotel or store, doing construction, serving food at a restaurant, and becoming a mechanic weren't the only range of jobs we wanted the five-year-olds around us to aspire to. We envisioned a learning community that would give life to the culture and language among this new generation, transmit a relational Hawaiian worldview, and nurture both traditional practices and the kind of cultural dexterity that would give learners options for choosing their own life path in the world.

We worked together to found and develop "Kamaika'i School," a culture-based education program for K-12 students that continues through the present day. The program we created brought many community stakeholders together around Native Hawaiian culture, and it changed the texture of our community by infusing cultural values into learning from the beginning. Looking back, it hardly seems like a radical proposition to teach students in the ways that their Indigenous community expects them to behave, but given the background of colonial literacy and education in Hawai'i (Benham and Heck 1998), what we achieved was unprecedented in many respects.

In our small town setting, public school had long functioned as a sort of holding pen for students to move through until they were old enough to work on the sugar plantation or in the tourist industry; it seemed almost fanciful to now expect students to learn innovation and other twenty-first-century skills – many didn't even get basic sex education. The historically entrenched boundaries of racism and disinheritance had long been replicated and normalized in the context of school, which now deployed standardized testing as a primary tool to explain social stratification in the present day. As a group, the students who were descendants of the original inhabitants of the Hawaiian Islands (before contact with Westerners in 1776) had the lowest attendance in the state and a disproportionate rate of identification with learning disabilities – not because they couldn't learn, but because schools provided them with so little of interest or purpose and expectations were unbelievably low.

One compelling reason that our community moved from dissatisfaction into action was that ‘Ōlelo Hawai‘i preschool programs had expanded; students now had opportunities to attend school in the Hawaiian language through grade 5 (ages 10 and 11), before transitioning to the English-medium public schools run by the state. These schools were taking in students whose performance and communication ability was clearly high, but who received low scores on placement tests they took because they had no prior experience with reading and writing in the English language; all their communication had been in ‘Ōlelo Hawai‘i. High IQ scores and low performance on placement tests doomed almost every student whose family had prioritized learning Indigenous language; most were eventually saddled with the classification of “special education” – a designation which, at the time, often stood primarily as an excuse to explain away low performance. Rather than a signal to assist, a student’s designation as being in need of special education caused some teachers to actually pay *less* attention to improving these learners’ performance. Our school mattered because our success reversed the expectation that Hawaiians wouldn’t achieve – one aspect of our mission for cultural revitalization in our community was to provide bilingual education from preschool onward while providing a family-like structure of meaningful supports for students who needed them and putting the purposeful perpetuation of heritage traditions and cultural identities at the heart of a land-based curriculum.

Our school became a success by any measure, but it was birthed in a hostile environment. The single statewide school district in Hawai‘i seemed to take offense at the fact that our Indigenous students had the highest rate of attendance to be found and that our program was garnering the attention of other communities that were curious what culture-based education might be able to do for their localities. We fought state bureaucracy and mandatory testing and sought limited English proficiency designation for students who were transitioning to learning English for the first time. We resisted federal pressures to meet national standards for “highly qualified” teacher licensure because our teachers were largely qualified as cultural practitioners, actively learning the craft of teaching. We were required to meet state standards for growth year after year or else face the consequence of having the school “reconstituted” (meaning all the teachers and staff members whose vision had given birth to the school would be fired).

One challenge we refused to back down from was the question of what we would do for literacy education (Keehne et al. [in press](#)). We faced a persistent, though genuinely false, stereotype of Hawaiians being “disadvantaged” or “remedial” and needing to make up some kind of language deficit – a view that existed among the Indigenous community as well as within the educational system at large. Our students were expected to fail, and it was assumed that they would need remediation programs. Before the school opened, we were encouraged by the school district, some parents, and some teachers to use a literacy program that had been researched and shown specifically to improve the scores of Hawaiian students. DISTAR (Direct Instruction System for Teaching Arithmetic and Reading) offered a reading program based on the methods of Direct Instruction, which has been shown over the last 50 years to be very effective at getting most children to learn to read (Baker et al.

2008; Dunn 2014; Good III et al. 2001). Hawaiian researcher Edward Kameʻenui demonstrated the power of the method to improve achievement test scores among populations of Native Hawaiian students who were struggling readers (Kameʻenui and Carnine 1998). Direct Instruction is research-based, but also highly structured and scripted – with a Pavlov-worthy vocabulary of gestures, snaps, and “cues” for call and response between student and teacher. The structure is predictable and effective at increasing test scores, yet often discourages young learners from developing enjoyment from literacy activity or building positive identity association as a reader and writer (Delpit 1988, 1995; Nasir et al. 2012). Indigenous communities often face challenges with the value of oracy vs. literacy, due to the role of literacy in colonization and aggressive assimilation, and its wake of cultural trauma; the risk of potentially reinforcing resistance to literacy among our youth was one we would not take.

We looked at DISTAR and saw a program that, at its most basic level, taught students to wait for commands and snaps, rather than inviting their contributions to the collective story fire and helping them discern when and how to use their voices for themselves and their community. Teachers would have to learn how to control the action with sounds and snaps, and our teachers judged it as fundamentally inconsistent with the kinds of familial relationships we wanted to cultivate at the school. Understanding the appropriate time and place to express themselves was part of the values-based curriculum; we couldn’t imagine a highly teacher-directed program like DISTAR furthering the kinds of relationships we wanted students to model, even though they were likely also to learn to decode language in its written form.

The pressure to adopt a scientifically tested best practice that had been validated with a population of Native Hawaiian learners was real and puts us under a high-stakes trial of our own. Some teachers asked: “Isn’t starting a school a big enough project already? Can we afford to saddle ourselves with even more uncertainty about “how to teach reading today?” at a time when our classrooms popped out of trunks or unfolded from portable plastic boxes at whichever outdoor learning location was our students’ site for the day. Others wondered: “What will it take to pull this off?” A few cautioned: “Is it realistic to try to ferry around language teaching materials, student journals, writers’ notebooks, literature circles and sandwich-bagged sets of leveled readers to promote development in both languages?”

At that early stage, we researched many models including conventional reading programs and the obvious “perfect” gold-standard solution that everyone recommended for Hawaiians: DISTAR. The more we teachers reflected on the aims of our school, the more we wondered how we could raise youth with a passion for personal and cultural self-determination and the power to use their *naʻau* (gut feeling or intuition) for guidance if every day we asked them to practice the opposite: habitual receptivity to explicit instruction in the classroom. We wanted to raise a generation who, following after Freire, were critically awake to their circumstances and knew how to use their own power to stand up and be heard or choose to wait vigilantly until the time was right for a debate. Voice, story, and self-efficacy were central outcomes we sought, and a literacy program could propel or strangle those. Everyone had heard of the Kamehameha Early Education Program and its success

with preschool students – they’d taken up strategies that were culturally coherent and built upon the children’s own culture of discourse – we wondered: Why couldn’t we find success by doing something similar at higher grade levels?

We ignored the weight of the research and the voices of critics who thought DISTAR was our answer, knowing that they didn’t share our vision of a graduate who was fluent in both languages and a true lover of literacy and the oral tradition alike. We began researching literacy development methods that could cultivate student agency and voice while allowing children to flow between the three languages spoken at our school: Standard Hawaiian (a.k.a. “university” Hawaiian), Hawaiian Creole English (Hawaiian Pidgin), and Standard English. We also knew that language was not enough: understanding both the English and Hawaiian cultural milieu and choosing when and how to move between them with an easy-thought-intentional cultural dexterity (Paris and Johnson, 2004, Personal Communication) was one of the goals we had for our students.

The search for a program seemed fruitless until we reached out across the Pacific and found a Māori expert on balanced literacy who had been a significant player in the movement in Aotearoa/New Zealand for increasing the use of Māori language in schools (Smith 1996, 2012). Our school’s commitment to bilingualism meant that we had to teach both languages skillfully, and we were eager to learn strategies that could help students make sense of the uneven terrain. The decision was up to us as a faculty, and our instructional leader encouraged us to dive in and think of ourselves as researchers – that for students like ours, the job of teacher necessarily included the role of researcher. We were going to have to apprentice ourselves to the context and learn from our students, learn from the community, and learn from the methods themselves about what an ideal program would look like for that particular place, purpose, and group (Johnson 2013). As a faculty, we weighed the pros and cons that we were able to anticipate at the time and decided to use the balanced literacy approach developed in Māori medium schools that encouraged students and their teachers to explore both languages using parallel strategies and techniques. We didn’t have bilingual materials at the scale they did, and we knew we’d have to invest more in producing culturally sustaining learning materials for use in Hawai‘i.

Following our initiation with the Māori expert, the teaching staff worked together for days at an open-air beach pavilion, planning how to teach literacy across the curriculum, and aware that there were only a few weeks before the inaugural quarter of school. There was much to research, including Kaupapa Māori, bilingualism, the learner-directed Reader’s Workshop and Writer’s Workshop methods used for older children, and the essential strategies for questioning and critical thinking. We set out to map our new program, develop culturally relevant materials in the form of bilingual leveled readers (funded by two grants), create our own teacher professional development sequence, and iteratively improvise on the practices that had been shared with us, rather than following a known path.

One example of an adapted strategy that helped us was the use of visual signaling to clarify which language was in use – as spoken in the room or written on the board. To clarify for students the difference between words in different languages, we made an effort to consistently use the same colors for writing on the whiteboard: green for

Hawaiian, red for English; this helped to clarify distinctions between words that looked the same, but meant very things depending on which language they were contextualized by, for example, *puke* (pronounced “POO-kay” and meaning “book” in ‘Ōlelo Hawai‘i) versus *puke* (pronounced “pyouk” and meaning “to be sick” in English). Without that guidance from the Māori context, it might have taken us years to realize that emerging readers were being confused by the use of two written languages and even longer to come up with a solution that worked as effectively as this convention. In this way as in many others, we benefitted from experimenting with the innovations that were shared with us, even though our practices often took a different shape.

The teaching staff at Kamaika‘i School received significant support in making the program a reality – we had a full-time professional development staff person who doubled as an assessment coordinator, and the instructional leader did everything possible to push our research initiative forward. The school made a huge investment in teacher professional development and collaborative course planning, to which we dedicated 1 day per week, meeting as a faculty while selected community members taught their knowledge and shared their gifts with our students in a special program. Every member of the faculty had “essential questions” relevant to their specific role at the school, and we conducted our own ongoing action research about small questions we had, testing our theories with tiny experiments.

Once we’d elected to chart our own path, we faced a steady stream of challenges in the search for a method that could propel our students to the kind of shining success in academics that would parallel the brilliant Indigenous intelligence we witnessed in them across so many other contexts (Chun 2011; Gardner 2011; Puku‘i et al. 1972). Doing the work of literacy program adaptation and refinement forced us to make difficult decisions and weigh competing priorities on a weekly basis, yet we knew it was the right choice. When we began, it was the only program that we could be sure would enhance the four central values of our school and the larger matrix of Hawaiian culture and language that we sought to cultivate within the next generation. The research we had done contributed to the schoolwide decision a few years later to switch to a more structured, computer-based literacy program – in order to meet the nationally mandated demand for students at each grade level to obtain higher scores than the previous year’s group of students in that grade. While the context changed, our experiences confirmed that building our own program was a strongly beneficial choice, setting direction for the school, galvanizing the teachers as researchers, and creating a coherent environment for young learners by aligning with a set of principles that were meaningful both to our community and for our students’ repertoires of practice (Gutierrez and Rogoff 2003).

As a faculty, we started as researchers and never stopped trying to “make sense” of the process we were engaged in; we were curious and vigilant, adaptable, and alert to the students and the community, as well as to the changing politics of the education environment that enveloped us. Had we followed the voices encouraging us to adopt a Western research-based program, the effects on our students would likely have reached a point of diminishing returns, as many anticipated. Most certainly we wouldn’t have developed formative experiences with the professional

habits of reflection in action (Argyris and Schon 1974) and the conduct of action research to the degree that we did.

We began with habits of inquiry, informal data gathering, iterative tinkering, reflection, and vigilance; thus, as the atmosphere of the school changed, we were able to respond with agility and alignment, transitioning to meet the changing needs of students as they gained new language proficiency and as the program itself navigated the process of maturing to accreditation.

Summary of Hawai'i Case Example

Despite the intense pressures of the US high-stakes testing environment and the increased district scrutiny faced by charter schools, faculty at the newly opened Kamaika'i School chose to forego use of the Direct Instruction literacy program that they were encouraged to adopt and to dive into the process of developing their own balanced literacy program – cultivating bilingualism in a way that was consistent with their cultural values. While the early reading program was eventually replaced with technology-based tools, teachers developed a new repertoire of skills in action research and iterative program development that crossed into other domains and influenced their professional trajectory. The experience of putting together a literacy program gave teachers experience with thinking critically and anticipating which practices and protocols were going to be consistent with the cultural values of the school, as well as the chance to test and confirm on a daily basis whether their mental models of the learning context were effective enough to help them support and sustain student learning (Johnson 2017).

Discussion

With global recognition of the UN Declaration on the Rights of Indigenous Peoples (2006) and other declarations like the Coolangatta Statement (1999), which assert Indigenous peoples' rights to define their own systems of education, increasing numbers of Indigenous peoples are formally incorporating local heritage wisdom, intergenerational voices, and cultural patterns as part of their schools; they are building values-based systems of community standards for practice, research, evaluation, and self-governance. Despite broad international understanding of Indigenous rights to self-determination, many Indigenous-serving schools and learning programs are still under pressure from government entities to adopt national curricula or comply with mandates for research-based interventions.

Efforts toward educational self-determination by Indigenous peoples in the United States have been hampered by educational policies pushing narrow definitions of achievement and restricting transdisciplinary approaches in learning and teaching (Meyer, 2017, Personal Communication). The modern American educational establishment assumes that the findings of randomized scientific trials are

infallible and what works for the general population is appropriate for all populations – a conclusion directly challenged by the case examples given above.

Any new practice introduced into the ecology of an Indigenous community school will have multilayered effects. Before adopting, adapting, or reinterpreting it, teachers and other program leaders must critically reflect on whether use of the new practice is aligned with its values, priorities, resources, and desired outcomes. Developing capacity for the type of self-directed research that can inform critical reflection is a key strategy in building values-aligned Indigenous educational systems, because it provides short-cycle feedback about what truly helps local learners reach and surpass the goals the community has set for them. Local research is a powerful way for a learning community to evaluate the benefit to their students of practices with positive potential, like these, for example: building intergenerational out-of-school connections, interpreting community patterns of social hierarchy, employing shared demonstrations of knowledge in ceremony or performance, visualizing community ideas through protocols for shared reflection and representation, facilitating apprenticeships in making or using cultural artifacts, and integrating knowledge through student-selected summative projects to show how each one has personally applied their learning for a real-world purpose, among many other potential practices. Regardless of the Indigenous, Western, scientific research, or other origins of the practice being considered, self-focused research on programs (conducted in accordance with community norms) can help schools anticipate and assess the effects that ripple outward when schools use new practices or seek to refine those that are longstanding.

Insights on Adapting Innovations and Interventions

Indigenous communities are extremely diverse, and when the distinctive features of each culture, language, and learning context are acknowledged, it is not difficult to see why some practices that are outstandingly effective for one Indigenous or multicultural context fall flat in another. The Diné case example reinforces the idea that generalized interventions are not easily transported into cultural contexts, and the Hawai‘i case reveals how Māori bilingual balanced literacy practices could not be directly transmitted even from one Indigenous community to another. The story of how the Kamehameha Early Education Program in Hawai‘i was tested as an innovation in the Navajo Nation is well known as an example of the need for attention to adaptation, even with its widely successful innovation.

The Kamehameha Early Education Program (KEEP) used a “talk story” method to engage young Kanaka Maoli learners in literacy development by utilizing a discourse strategy and interpersonal roles that were already common in their Hawaiian community (Au 1980; Tharp 1982). Hawai‘i teachers researching the “talk story” method began to debate among themselves whether KEEP’s innovations were a culturally specific modification or whether these were simply better teaching methods – the group sought a collaboration with teachers at the Rough Rock

Demonstration School in the Navajo Nation to explore this question. Across the board, the Diné teachers found that the KEEP strategies needed modification:

For Hawaiian children, groups of four to five students of mixed sex and ability produced manageable and useful patterns of peer interaction and assistance at centers. At Rough Rock, this arrangement made for discomfort and often wiped out academically useful interaction. After experimenting with a number of conditions, the best guess of the team at that point was that Navajo children would better help and interact in small groups of two to three students of the same sex, working at the same task; and before the end of the semester the team moved to begin reorganizing the classroom on that basis. (Jordan 1995, p. 95–96)

In this situation, a successful strategy from the Hawai'i context required significant modification to work effectively in Navajo settings, and yet the central strategy stayed the same: change classroom culture to make it compatible with the children's own culture. It would have been easy for Rough Rock teachers to conclude that KEEP, as an innovation, simply was not working for their students, but they persisted in looking more deeply – at the level of the core intention of the practice itself – and then creatively interpreting how to access that same meaning through their Diné cultural lens. They stayed focused on student-directed interactions, even though the interactions themselves looked significantly different in the Navajo context. The Diné teachers addressed every feature of the program in this way, looking at its core innovation and finding the cross-cultural analogue or parallel principle reflecting a similar cultural intent.

In KEEP classrooms, just as in the bilingual balanced literacy program chosen by Kamaika'i School above, teachers specifically avoided decontextualizing literacy learning. At every turn, they encouraged meaningful communication motivated by authentic relationships and purposes – consistently using strategies that functioned effectively both in school contexts and the cultural and family milieu beyond. The only pedagogical practices enacted were those that promoted patterns of behavior among individuals and within the group that *reflected* and sustained Indigenous cultural patterns – rather than suppressing them (Paris 2012; McCarty and Lee 2014). The form of such practices may vary widely across Indigenous groups, but finding a culturally coherent match between values and actions is essential.

Roland Tharp, one of the leaders of the KEEP team, continued to conduct research across the United States with diverse cultural and linguistic groups at the Center for Research on Education, Diversity, and Excellence (CREDE). They developed a set of “Standards for Effective Pedagogy” which, while not universal, can help guide local research initiatives seeking cultural coherence and practices for Indigenous education that are culturally sustaining and revitalizing (see www.crede.berkeley.edu). Since these Standards for Effective Pedagogy were developed and validated in diverse Indigenous communities, learning programs that are seeking to engage in local research initiatives to support student learning may find them beneficial.

The way that KEEP's narrative-based method functioned so differently in Indigenous communities in Hawai'i and Navajo settings reminds us that the effects of even the most promising interventions need to be examined closely and interrogated

with care. Though generalizing research is a common practice, in truth, it is an unreasonable expectation to transplant a set of understandings grounded in one cultural community to another, with the assumption that they will be effective – especially in Indigenous contexts.

The Power of Local Research and Assessment

There are abundant signs that the tide is turning when it comes to the credibility of local Indigenous research initiatives, as seen in the examples that follow. Professional organizations like the American Evaluation Association (AEA) have shown growing interest in culturally responsive assessment; AEA has issued a statement on Cultural Competence in Evaluation recommending that its members have substantive understanding of the influences of cultural context and diversity in processes of evaluation (American Evaluation Association 2011; Hood et al. 2015). In 2012, the Center for Culturally Responsive Evaluation and Assessment (CREA) was established to address the need for evaluation professionals to employ a multicultural lens as they interpret fundamentals of assessment and evaluation to obtain valid and actionable results (Hood 2014). A successful Māori effort to produce 500 PhDs in 5 years (Villegas 2010) inspired parallel efforts to build a critical mass of scholars and thus increase Indigenous community research capacity in First Nations of Canada and in Hawai'i. Awareness of the need for holistic and analytical attention to evaluation has broadened, and models like the praxis-based Kaupapa Māori and tools like Indigenous Evaluation Frameworks are in high demand (Cram et al. 2015; LaFrance et al. 2015; LaFrance and Nichols 2009, 2010). The trend seen across these initiatives has sparked interest widely and is only likely to grow, due to its power to enhance the fit between innovative practices and interventions for Indigenous learning programs.

Research Methodologies to Explore

The vetting of practices through locally based research initiatives requires the selection and use of research methodologies that are appropriate for each Indigenous community that employs them. In selecting an approach, communities need to know what best aligns with their values, the current capacity of the program or initiative, and the level time and other resources available to dedicate to the process (Kawakami et al. 2008; Kara 2015). There are many Indigenous research methodologies available (Denzin et al. 2008; Kovach 2010; Smith 2013), and below is a sample list that includes a few of those, as well as other general methodologies that have been applied effectively in Indigenous contexts:

1. Close observation – in your cultural style (Kanahele 1992; Lipka et al. 1998; Puku'i et al. 1972; Charlot 2005 p. 177–182)
2. Action research (Putman and Rock 2017; Mertler 2017; Robertson 2000)

3. Participatory action research (James et al. 2008; Privitera and Ahlgrim-Delzell 2018)
4. Place-based Indigenous action research – Indigenous heuristics (Baker et al. 2015; Kahakalau 2002, 2004; Smith 2013)
5. OODA loop – “Observe, Orient, Design, Act” (Angerman 2004; de Banter 2017)
6. Design process methodology – human-centered design for learning (Dubberly 2008; Stanford D.school and Both 2018) and design process for teacher learning (Johnson 2017)
7. Appreciative inquiry (Whitney and Cooperrider 2011; Cooperrider and Srivastva 1987)
8. Empowerment evaluation (Fetterman and Wandersman 2007)
9. Participatory evaluation (Brunner and Guzman 1989)
10. Developmental evaluation (Gamble 2008; Patton 1994, 2011)
11. Collective impact (Kania et al. 2014a, b; Henig et al. 2015)

Many success stories come from Indigenous communities who have used diverse methodologies to create their own genealogy of knowledge development in the domain of culture-based learning and teaching (see chapters in this volume, e.g.: ► Chaps. 56, “Raven’s Story About Indigenous Teacher Education”; ► 39, “Yachayninchis (Our Knowledge): Environment, Cultural Practices, and Human Rights Education in the Peruvian Andes”; and ► 60, “Indigenous Knowledge(s) and the Sciences in Global Contexts: Bringing Worlds Together” Rigney & Bignall). Extending this development to research, these groups have had to build internal capacity so that the rising tide for understanding the basic concepts of assessment and evaluation filters through an Indigenous lens rather than an external Western one. This means elders, community members, educators, and evaluators who have deep knowledge about the character and influence of culture and context can collectively build assessment tools and identify measures based on their shared values and cultural foundation.

Community-specific cultural evaluation initiatives like Kaupapa Māori (Baker et al. 2015) and the Hawai‘i studies of culture-based education effectiveness (Kana‘iaupuni et al. 2005; Nā Lau Lama Community Report 2006) have established their own internal validity and are models to review when planning a multi-year push to build capacity for evaluation and research-based testing. Parallel development of measures for assessment and evaluation of one’s own initiatives goes hand in hand with such research, so that processes for continued growth and improvement stay in focused alignment with the core values and outcomes that each community sets forth in its aims. Without a direction for self-determination, it is impossible to know whether the results achieved are furthering the significant aspirations for our communities.

Ongoing self-assessment is an essential tool in the effort to incorporate the Indigenous knowledge carried by youth into formal learning experiences. Values-aligned, self-reflective practice is a powerful method because it requires initiatives and interventions to build an evidence-based model of precisely what advances their stated goals, in their particular community. Testing and iterative improvement of practices based on real evidence can gain real traction when the following principles are in practice:

1. *Have a clear vision for the community.* Articulated values are the foundation that makes it possible to determine whether the impact of an innovation or intervention (new practice) is having the *desired* result. Maintaining integrity to Indigenous standards and values is far more likely when the infrastructure exists to support self-correction and recursive refinement in whatever program is being tried and tested.
2. *Have multiple feedback streams.* Feedback must cross differing time scales and diverse perspectives (stakeholder groups, various types of outcomes, etc.). Whether the intervention is general and research-based, or a method or innovation that has been beneficial for another Indigenous community, or even if your neighbors have tried it in a nearby community that shares your language, it will be worth the time and energy invested to gather data across several streams of feedback, in order to really understand how it is functioning in *your* context.
3. *Plan for contextualized/decontextualized assessments, as well as assessments of learning and assessments for learning.* This may mean developing capacity for assessment practices and data analysis within your school or district community.
4. *Create a study group or a research group of individuals who are dedicated to building this kind of expertise* and who can support one another. Every learning community that is serious about doing the best they can for their learners needs to build this capacity if they want to continue Indigenous education year after year as the community itself changes and as local-, state-, and national-level policies shift.

Building capacity in assessment and evaluation is part of what makes it possible to carry out this kind of community-level testing; but, the reverse is also true. Learning communities must begin to test innovations and work with that data to become familiar with ways in which these big ideas translate into action. Learning can progress in both directions.

To advance your capacity for local research, consider focusing your resources on steps like these:

- Build capacity across the community for action research and the recursive use of data; teach other people what you know.
- Cultivate adaptive expertise among educators in the community to increase innovation/efficiency in the use of program data (Athanases et al. 2015; Crawford 2007; Schwartz et al. 2005).
- Use data to map relevant relationships and model salient variables in past shifts.
- Anticipate impacts of the proposed intervention by thinking through detailed questions (e.g., “How might this new practice of literature circles shape our cultural interactions around storytelling?”)
- Envision and test adaptations (e.g., “Sequencing events in our cultural way is different than in the Western way. How can we modify the role of the “Summarizer” in the conventional literature circle?”)
- Gather baseline snapshots of performances, for comparison with later trials.
- Develop a heuristic set of questions around community priorities that can help guide and broaden reflection when considering adoption of novel or external

practices (e.g., “How does this new literature circle practice support and/or detract from the skills needed to reach our community goals of self-determination? How does it support and/or take away from Indigenous learners’ language fluency? What is already working in the school that shares its features with this innovation we are considering?”)

- Utilize an Indigenous research heuristic to guide your inquiry, as described in the principles Kahakalau sets forth (2002, 2004).

Focused efforts in these areas will help build a dynamic picture of the kinds of impacts that the introduction of a new practice is having in the situated context of a learning community, providing multiple streams of data that inform future research cycles, shape educator decision-making, and support shifts toward effective learning aligned with local values.

Conclusion and Future Directions

Even the most well-researched educational interventions can have negative effects when applied across diverse communities in a monolithic fashion. Types of adverse impacts to watch for when considering and implementing new research-based practices include (but are not limited to) the following:

- Suppressing use of Indigenous or heritage languages
- Subducting Indigenous worldviews under the dominant worldview (e.g., as represented in externally developed curricular materials)
- Imposing constructs about well-being that contradict or dismiss Indigenous understandings of individual, collective, and spiritual interdependence
- Transgressing interactional norms based on kinship, status, age, etc.
- Enforcing nonverbal signals or contextual cues that initiate and regulate interactions in uncomfortable ways (such as sustained eye contact or verbal back-channeling)
- Shifting focus toward values and content that are wholly external to learners’ lived experiences
- Supplanting community patterns of questioning, discussion, decision-making or conflict management processes, etc.
- Minimizing Indigenous values and locally valued knowledge in favor of widespread dominant values and/or globally valued knowledge

These types of negative effects can make even the most rigorously tested innovation limited in benefit for Indigenous and other diverse learners. More generative and culturally sustaining adaptations of promising practices may emerge over time when schools, administrators, and teachers begin to iteratively apply locally gathered evidence and action research methods to modify and select strategies that are well tailored for the context.

Studies conducted by developmental evaluation researcher Michael Patton (1994, 2011) and situation awareness researcher Mica Endsley (1995, 2000; Endsley et al. 2003) provide models that point to the critical importance of looking within any system for indicators that can provide ongoing feedback. Identifying these key factors and attending to them with vigilance creates significant leverage and gives power to positively influence the system as a whole. Applying these models to schools as complex, interdependent (and sometimes ill-structured) systems, it becomes clear that educators serving Indigenous communities have a challenging task: they must learn to pay attention to both figure and ground, toggling back and forth between the micro-repercussions of interventions, and the community-wide ripple effects that impact generations to come.

To accomplish this, learning communities need resources and structural support to conduct their own locally driven action research; school districts must become responsive to the multiple feedback streams that come from formative data, in addition to summative test data. Even the US government recognizes the need for intensive supports in certain underserved geographic areas, offering supplemental resources to reduce inequity through special programs like contract schools, Title I funding, and the Johnson-O'Malley Act. Yet the energy that government agencies put into addressing the distinctive needs of children from various cultures and languages is often overpowered by the sheer momentum of more widespread models. Rather than waiting for the USDOE and the federal government to become more nimble and responsive, schools in Indian Country can dedicate resources to learning, applying, and adapting the methods needed to become fluent in locally producing research, assessments, and data – allowing learning communities to attend to the needs at hand with ongoing precision and a greater degree of self-determination.

As Indigenous educators, we must take to heart the fact that “the specific propositions derived from general theories of learning can be viewed only as hypotheses. They may be true, but it is quite possible that they are false. Until they have been subjected to empirical test they must be viewed as unproved” (Averch et al. 1972, p. 21). Putting this view into practice is of vital importance for Indigenous communities and for diverse learners in contexts where historical and contemporary factors add unpredicted complexity to the ways that scientifically tested interventions operate. To optimize the benefits of strategies and innovations and truly enhance learning for Indigenous communities, a higher standard of context-adaptive, iterative, and empirical testing must be applied – a standard that calls for locally driven research that is responsive to multiple contexts and to uniquely situated communities like those of the Kānaka Maoli and Diné.
