Received and accepted 10 January 1990

The classification and nomenclature of wheat gluten proteins has been recently reassessed [6]. Gliadins of the  $\alpha/\beta$  type are a subgroup of the S-rich prolamins which are characterized by a particular domain structure [6]. The cDNAs and/or genomic DNAs of a number of genetic variants have been cloned and sequenced [1–5, 7].

We have isolated a cDNA clone from a library obtained from developing endosperm of *Triticum aestivum* cv. Chinese Spring which encodes an  $\alpha/\beta$ -type gliadin that differs from previously described ones. The nucleotide sequence and deduced amino acid sequence of the new  $\alpha/\beta$ -gliadin clone, designated MM1, have been aligned in Fig. 1 with those corresponding to the class A-IV  $\alpha/\beta$ -gliadin of Okita *et al.* [3], which shows the closest resemblance to MM1 among those previously described. The proline-rich N-terminal domain is described in terms of six heptapeptide (VII-1 to VII-6) and six hexapeptide (VI-1 to VI-6) repeats, the hexapeptide consensus being contained in the heptapeptide one: (L)P<sub>Y</sub><sup>F</sup>PQPQ. The following features of gliadin MM1 are different from the aligned class A-IV gliadin A735: (1) the additional heptapeptide VII-5, which is an identical replica of VII-3 and VII-4; (2) an additional nonapeptide in the first long poly-Q stretch (residues 141–149); (3) two QQQ deletions at positions 134 and 231. Apart from the

alluded insertions and deletions, only 13 nt changes are observed out of 921 coding nt, 11 of which lead to amino acid changes.

The nucleotide sequence reported will appear in the EMBL, GenBank and DDBJ nucleotide sequence databases under the accession number X17361.

**Fig. 1.** Nucleotide sequence and deduced amino acid sequence of  $\alpha/\beta$ -gliadin MM1, aligned with those corresponding to class A-IV gliadin A735 [3]. Identical nt are indicated by dots (·) and missing nt by dashes (—). Heptapeptide (VII) and hexapeptide (VI) repeats are indicated by horizontal arrows. Amino acid stretches missing in A735 are indicated by horizontal bars (—▲—) and additional amino acid residues in A735 are printed out of line.
