

C. P. Slichter, University of Illinois at
Urbana-Champaign, IL, USA

Principles of Magnetic Resonance

3rd enlarged and updated ed. 1989. XI, 655 pp. 185 figs.
(Springer Series in Solid-State Sciences, Vol. 1).
Hardcover DM 89,- ISBN 3-540-50157-6

Magnetic resonance is a powerful experimental method for investigating the properties of condensed matter at the atomic or molecular level. This text is intended for graduate students in physics, chemistry, materials science, biology, medicine, or engineering intending to work in nuclear magnetic resonance. The third edition adds new material to many parts, plus new sections on one- and two-dimensional Fourier transform methods, multiple quantum coherence, and magnetic resonance imaging.

From the reviews:

"... one of the best expositions of the quantum theory of resonance in existence. It has my highest recommendation for use as a textbook." *Journal of the Optical Society of America*
"The clarity and style in which the book is written reveals Slichter's research expertise and talent as an excellent teacher and expositor..." *Physics Today*

Millimetre and Submillimetre Wavelength Lasers

A Handbook of cw Measurements

1989. XI, 278 pp. 15 figs. (Springer Series in Optical Sciences, Volume 61). Hardcover DM 108,-
ISBN 3-540-50827-9

Millimetre and Submillimetre Wavelength Lasers deals with continuous wave lasers operating at wavelengths between a few tens of microns and several millimetres. It offers a timely review of the main principles of the submillimetre laser, and will be of interest to researchers with a desire to make greater use of this part of the spectrum. With a database of the 4173 currently known cw laser lines, derived from a critical review of over 300 published articles, and with chapters reviewing the relevant molecular spectroscopy as well as power, frequency and wavelength measurements, the book will also be indispensable to seasoned workers.
