## **A WEAK NONSMOOTH PALAIS-SMALE CONDITION AND COERCIVITY**

NIKOLAOS C. KOUROGENIS - NIKOLAOS S. PAPAGEORGIOU

In this paper we show that a generally nonsmooth locally Lipschitz function which satisfies the nonsmooth C-condition (nonsmooth Cerami condition) and is bounded from below, is coercive. The Cerami condition is a weak form of the well-known Palais-Smale condition, which suffices to prove minimax principles.

## **1. Introduction.**

the PS-condition, if any sequence  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $\{\phi(x_n)\}_{n\geq 1}$  is n, if any sequence  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $\{\varphi(x_n)\}_n$ <br> $\langle (x_n) \longrightarrow^{\infty} 0$ , possesses a strongly convergent subsequent bounded and  $\phi'(x_n) \stackrel{n \to \infty}{\longrightarrow} 0$ , possesses a strongly convergent subsequence. the PS-condition has the following form: Let  $Y$  be a Banach space and  $\phi$  :  $Y \rightarrow \mathbf{R}$  a Frechet differentiable function. We say that  $\phi$  satisfies functionals  $\phi: Y \to \mathbf{R}$ . In this case the PS-condition has the following The Palais-Smale condition ("PS-condition" for short) plays a critical role in optimization theory and in the variational analysis of elliptic boundary value problems. The PS-condition is a compactness-type condition which guarantees the convergence of minimizing sequences of a particular type, thereby proving the existence of an actual minimizer. In the smooth case This condition was extended by Chang [4] to nonsmooth, locally Lipschitz

<sup>1991</sup> AMS Subject Classification: 47H99, 49J52.

*Key words and phrases* : Palais-Smale condition, nonsmooth Palais-Smale condition, nonsmooth C-condition, Ekeland variational prinicple, locally Lipschit function, Clarke's subdifrential, coercive function.

of Clarke [5] of f. Recall that if  $\phi \in C^1(Y, \mathbf{R})$ , then  $\partial \phi(x_n) = {\phi'(x_n)}$  for form: Any sequence  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $\{\phi(x_n)\}_{n\geq 1}$  is bounded and equence  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $\{\phi(x_n)\}_{n\geq 1}$  $\lambda_n$ ) = min{ $||x^*||$  :  $x^* \in \partial \phi(x_n)$ }  $\stackrel{n \to \infty}{\longrightarrow}$  $m(x_n) = \min\{\Vert x^* \Vert : x^* \in \partial \phi(x_n)\} \stackrel{n \to \infty}{\longrightarrow} 0$ , has a strongly convergent subsequence. Here by  $\partial \phi(x_n)$  we denote the subdifferential at  $x_n$  in the sense  $n \parallel$ *ym* $(x_n)$ *n* all  $x \in Y$ . Using this condition Chang [4] developed a critical point theory for  ${x_n}_{n>1} \subseteq Y$  such that  $\{\phi(x_n)\}$  $+\Vert x_n \Vert m(x_n) \xrightarrow{n \to \infty}$  $\phi(x_n)$  $(1 + ||x_n||) m(x_n)$  $x_n$ <sub> $n\geq 1$ </sub>  $\subseteq$  *Y* such that { $\phi(x)$  $x_n$ ||)*m*(*x* variational problems with nonsmooth, locally Lipschitz energy functionals. A weaker form of the smooth PS-condition was introduced by Cerami [3]. In the more general nonsmooth, locally Lipschitz setting, Cerami's condition has the following form: Any sequence  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $\{\phi(x_n)\}_{n\geq 1}$  is bounded and  $(1 + ||x_n||)m(x_n) \longrightarrow^{\infty} 0$ , has a strongly convergent subsequence. In what follows, we call this condition the "nonsmooth C-condition". This weaker condition can give us either via Ekeland's variational principle or via a deformation lemma, various minimax principles (see Bartolo-Benci-Fortunato [1] (smooth case) and Zhong [9], Kourogenis-Papageorgiou [7] (nonsmooth cases)).

It has been observed that in the differentiable case, the PS-condition implies coercivity for a functional which is bounded below. This was proved by Costa-Silva [6] (for a Frechet differentiable functional) and by Calcovic-Li-Willen [2] (for a Gateaux differentiable functional which is also lower semicontinuous). In this note we extend this result to nonsmooth locally Lipschitz functionals which satisfy the nonsmooth C-condition.

In the proof of our main result we will need the following recent generalization of the Ekeland variational principle, due to Zhong [9].

Z ROPOSITION 1. If  $h$  :  $\mathbf{R}_{+} \rightarrow \mathbf{R}$ space,  $x_0 \in Y$  is fixed,  $\phi: Y \to \overline{\mathbf{R}} = \mathbf{R} \cup \{+\infty\}$  is lower semicontinuous 0  $\underset{\infty}{\text{If }} h : \mathbf{R}_{+} \rightarrow \mathbf{R}_{+}$  $+$  $\frac{d}{dx}(r) = +\infty$ ,  $(Y, d)$  $f$ unction not identically  $+\infty$  which is bounded from below, *If*  $h : \mathbf{R}_{+} \rightarrow \mathbf{R}_{+}$  *is a continuous nondecreasing* function such that  $\int_0^{\infty} \frac{1}{1+h(r)} dr = +\infty$ ,  $(Y, d)$  is a complete metric PROPOSITION 1. If  $h$  : 1 1

*then for any given*  $\lambda > 0$ ,  $\varepsilon > 0$  *and*  $y \in Y$  *such that*  $\phi(y) \le \inf_{Y} \phi + \varepsilon$ ,  $we can find x \in Y$  such that

(a)  $\phi(x) \leq \phi(y)$ ;

(b) 
$$
\phi(x) \le \phi(u) + \frac{\varepsilon}{\lambda(1 + h(d(x_0, x)))} d(u, x)
$$
 for all  $u \in Y$ ; and

(c)  $d(x, x_0) \leq d(y, x_0) + \overline{r}$ , where  $\overline{r} > 0$  is such that

$$
\int_{d(y,x_0)}^{d(y,x_0)+\bar{r}} \frac{1}{1+h(r)} dr \geq \lambda.
$$

## **2. Main result.**

The next theorem and its corollary extend the results of Costa-Silva [6] and Calkovic-Li-Willem [2] to nonsmooth, locally Lipschitz functionals which are bounded from below and satisfy only the nonsmooth C-condition.

THEOREM 2. If Y is a Banach space,  $\phi: Y \to \mathbf{R}$  is locally Lipschitz  $||y|| \rightarrow \infty$ and bounded below and  $c = \lim_{h \to 0} \phi(y)$  is finite,

*then there exists a sequence*  $\{x_n\}_{n\geq 1} \subseteq Y$  such that  $||x_n|| \to \infty$ ,  $\phi(x_n) \to c$  and  $||x_n|| m(x_n) \to 0$  as  $n \to \infty$ .

 $||x|| \ge M_n$ ,  $\phi(x) \ge c - \frac{1}{n}$ ,  $n \ge 1$ ,  $M_{n+1} \ge M_n + 2$ ,  $M_1 \ge$  ${y_n}_{n \geq 1}$  such that  $\phi(y_n) < c +$ finite. By the definition of c we can find  $M_n > 0$  such that for any  $x \in Y$ *Proof.* Let  $\eta = \inf[\phi(y) : y \in Y]$ . Because  $\phi(\cdot)$  is bounded below,  $\eta$  is *n* with  $||x|| \ge M_n$ ,  $\phi(x) \ge c - \frac{1}{n}$ ,  $n \ge 1$ ,  $M_{n+1} \ge M_n + 2$ , M *n* 1 ,  $n \ge 1$ ,  $M_{n+1} \ge M_n + 2$ ,  $M_1 \ge 1$ . We also can find  $\{y_n\}_{n\geq 1}$  such that 1 and

$$
||y_n|| > \frac{M_n + 2 + \frac{1}{2} \left(\frac{1}{n}\right)^{\frac{1}{2}}}{1 - \frac{1}{2} \left(\frac{1}{n}\right)^{\frac{1}{2}}}, \ n \ge 1.
$$

1 ≥  $\rightarrow \infty$  $n \nvert n \geq 1$  we have that  $||y_n|| > M_n$ From the definition of  $\{y_n\}_{n\geq 1}$  we have that  $||y_n|| > M_n + 2 \stackrel{n \to \infty}{\longrightarrow} 0$ .

 $h(r) = ||y_n||, x_0 = y_n, \varepsilon = \varepsilon_n = c + \frac{1}{r} - \eta_n$ Now, we define  $\phi_n : Y \to \mathbf{R}, n \geq 1$  such that  $\phi_n(x) = \phi(x)$ when  $||x|| > M_n + 1$ ,  $\phi_n(x) = \phi(x) + (c - \eta)(M_n + 1 - ||x||)$  when  $M_n < ||x|| \le M_n + 1$  and  $\phi_n(x) = \phi(x) + c - \eta$  when  $||x|| \le M_n$ . Then  $\phi_n$ ,  $n \ge 1$ , are locally Lipschitz and  $\eta_n = \inf[\phi_n(y) : y \in Y] \ge c$ *n n* ,  $n \ge 1$ , are locally Lipschitz and  $\eta_n = \inf[\phi_n(y) : y \in Y] \ge c - \frac{1}{\cdot}$ . Apply proposition 1 with  $h(r) = ||y_n||$ ,  $x_0 = y_n$ , 1

 $(1)^{\frac{1}{2}}$  $(1)^{\frac{1}{2}}$  $n\overline{2}\left(\overline{n}\right)$  we can lind  $x_n$  $\phi_n(x_n) \leq \phi_n(y_n) = \phi(y_n) \leq c$  $\phi_n(x_n) \leq \phi_n(u) + \left(\frac{1}{n}\right)$   $\frac{1}{1 + ||y_n||} ||x_n||$ and  $\lambda = \lambda_n \frac{1}{\alpha} \left( \frac{1}{n} \right)$ . We can find  $x_n \in Y$ ,  $n \ge$  $\phi_n(x_n) \leq \phi_n(y_n) = \phi(y_n) \leq c + \frac{1}{n},$ *n y*  $\phi_n(x_n) \leq \phi_n(u) + \left(\frac{1}{n}\right)^{\frac{1}{2}} \frac{4}{1 + ||y_n||} ||x_n - u||$ 1 2 1 . We can find  $x_n \in Y$ ,  $n \geq 1$ , such that 1

for all  $u \in Y$  and

$$
||x_n - y_n|| \le \left(\frac{1}{n}\right)^{\frac{1}{2}} \frac{||y_n|| + 1}{2}
$$

for all  $n \geq 1$ .

Let  $u = x_n + tv$  with  $t > 0$  and  $v \in Y$ . Then we have

$$
-\xi_n\|v\| \le \frac{\phi_n(x_n + tv) - \phi_n(x_n)}{t}
$$

 $-\xi_n \|v\| \le \phi_n^0(x_n; v)$  for all  $n \ge 1$  and all  $v \in Y$ .  $(1)^{\frac{1}{2}}$  $n = \left(\frac{n}{n}\right)$   $\frac{1 + ||y_n||}{1 + ||y_n||}$ where  $\xi_n = \left(\frac{1}{n}\right)^{\frac{1}{2}} \frac{4}{1 + ||y_n||} \downarrow 0$  as  $n \to \infty$ . Letting  $t \downarrow$  $\frac{1}{1 + ||y_n||} \downarrow 0$  as  $n \to \infty$ . Letting  $t \downarrow 0$  we obtain

 $0(r \cdot v) - \phi^0$  $\psi_n(v) = \frac{1}{\xi_n} \phi^0(x_n; v)$ . Then  $\psi(\cdot)$  is sublinear, continuous with  $\psi(0) =$ can find  $y_n^* \in Y^*$ ,  $n \ge 1$ , such that  $||y_n^*|| \le 1$  and  $(y_n^*, v) \le \psi_n(v)$  for all  $n \geq 1$  and all  $v \in Y$ . Then if  $x_n^* = \xi_n y_n^*$ , we have  $||x_n|| \ge ||y_n|| - ||x_n - y_n|| \ge ||y_n|| - \left(\frac{1}{n}\right)^{\frac{1}{2}} \frac{||y_n|| + 1}{2} \ge M_n$ *n n* **b**  $\varphi_n^{\circ}(x_n; v) = \varphi^{\circ}(x_n)$ and  $-\|v\| \leq \psi_n(v)$  for all  $v \in Y$ . Invoking lemma 1.3 of Szulkin [8], we  $||x_n|| \ge ||y_n|| - ||x_n - y_n|| \ge ||y_n||$ *n*  $\frac{y_n\|+1}{2} \geq M$ *y<sub>n</sub>*). So  $\phi_n^0(x_n; v) = \phi_0^0(x_n; v)$  for all  $v \in Y$  $||x_n|| \ge ||y_n|| - ||x_n - y_n|| \ge ||y_n|| - \left(\frac{1}{2}\right)^{\frac{1}{2}} \frac{||y_n|| + 1}{2} \ge M_n +$  $; v) = \phi^{0}(x_{n}; v)$  for all  $v \in$ But  $1 \n\begin{bmatrix} \frac{1}{2} & ||y_n|| + 1 \end{bmatrix}$ 2 2 (from the choice of  $y_n$ ). So  $\phi_n^0(x_n; v) = \phi_0^0(x_n; v)$  for all  $v \in Y$ . Let . Then  $\psi(\cdot)$  is sublinear, continuous with  $\psi(0) = 0$ 

$$
(x_n^*, v) \le \phi^0(x_n, v)
$$
 for all  $n \ge 1$  and all  $v \in Y$ ,  
 $\Rightarrow x_n^* \in \partial \phi(x_n)$  for all  $n \ge 1$ .

Hence 
$$
m(x_n) \le ||x_n^*|| \le \xi_n \Rightarrow (1 + ||y_n||)m(x_n) \le 4\left(\frac{1}{n}\right)^{\frac{1}{2}} \stackrel{n \to \infty}{\longrightarrow} 0.
$$

524

 $||x_n|| \le ||y_n|| + ||x_n - y_n|| \le ||y_n|| + \left(\frac{1}{n}\right)^{\frac{1}{2}} \frac{||y_n||}{||y_n||}$ So,  $||x_n|| m(x_n) \xrightarrow{n \to \infty} 0$ .  $||x_n|| \le ||y_n|| + ||x_n - y_n|| \le ||y_n|| + \left(\frac{1}{2}\right)^{\frac{1}{2}} \frac{||y_n|| +}{2}$ *n y* On the other hand  $1 \n\begin{bmatrix} \frac{1}{2} & ||y_n|| + 1 \end{bmatrix}$ 

1  $\rightarrow \infty$   $n \rightarrow \infty$ ≥  $\phi(x_n)$  $n \parallel \geq M_n$ *n n n n n*  $||x_n|| \geq M_n + 2 \stackrel{n \to \infty}{\longrightarrow} \infty \Rightarrow \phi(x_n) \stackrel{n \to \infty}{\longrightarrow}$  ${x_n}_{n>1} \subseteq$  $x_n \parallel \geq M_n + 2 \stackrel{n \to \infty}{\longrightarrow} \infty \Rightarrow \phi(x_n) \stackrel{n \to \infty}{\longrightarrow} c$  $\{x_n\}_{n\geq 1} \subseteq Y$ Finally,  $||x_n|| \geq M_n + 2 \stackrel{n \to \infty}{\longrightarrow} \infty \Rightarrow \phi(x_n) \stackrel{n \to \infty}{\longrightarrow} c$ . Therefore is the desider sequence.

An immediate consequence of this proposition is the following corollary.

COROLLARY 3. If Y is a Banach space,  $\phi: Y \to \mathbf{R}$  is locally Lipschitz, *bounded below and satisfies the nonsmooth C-condition,*

*then*  $\phi(\cdot)$  *is coercive.* 

 $n \parallel m(x_n)$ 

Now we are ready to prove our last theorem.

**THEOREM** 4. If Y is a Banach space,  $\phi: Y \to \mathbf{R}$  is locally Lipschitz, then  $\phi(\cdot)$  also satisfies the nonsmooth PS-condition. *bounded below and satisfies the nonsmooth C-condition,*

*Proof.* Let  $\phi: Y \to \mathbf{R}$  a locally Lipschitz, bounded below functional which satisfies the non-smooth C-condition. Let also  $\{x_n\}_{n\geq 1} \subseteq Y$  along 1 we can extract from  $\{x_n\}_{n\geq 1}$  a strongly convergent subsequence. condition. Let also  $\{x_n\}_{n\geq}$  $\phi$  is bounded and  $m(x_n) \stackrel{n \to \infty}{\longrightarrow} 0$ . It is easy to see that  $\{x_n\}_{n \geq 0}$  $(1 + ||x_n||)m(x_n) \stackrel{n \to \infty}{\longrightarrow} 0$  and as  $\phi(\cdot)$ bounded because of the coercivity of  $\phi(\cdot)$  (see Corollary 3). So, indeed *n* which  $\phi$  is bounded and  $m(x_n) \stackrel{n \to \infty}{\longrightarrow} 0$ . It is easy to see that  $\{x_n\}_{n \geq 1}$  is  $1 + ||x_n||$ ) $m(x_n) \stackrel{n \to \infty}{\longrightarrow} 0$  and as  $\phi(\cdot)$  satisfies the nonsmooth C-condition

*Remark.* From the last theorem it follows trivially that the Min-Max theorems for locally Lipschitz and bounded below functionals which satisfy the PS-condition are expanded to the case of C-condition.
