

A Survey of Aphid Parasitoids in Kahramanmaraş, Turkey (Hymenoptera: Braconidae, Aphidiinae; and Hymenoptera: Aphelinidae)

M. Murat Aslan,^{*1} Nedim Uygur² and Petr Starý³

A list of aphid parasitoids found in a survey conducted between 1999 and 2001 in Kahramanmaraş Province of Turkey is presented. Nineteen taxa of aphid parasitoids were found on 30 hosts. *Pauesia picta* (Haliday) is reported for the first time from Turkey. Two check-lists are presented, by host aphids and by plant species.

KEY WORDS: Aphid parasitoids; survey; tritrophic associations; Kahramanmaraş; Turkey.

INTRODUCTION

Aphids (Homoptera: Aphidoidea) are an economically important group of insects in Turkey as well as many other countries. Their economic importance is due mostly to their destructiveness to agricultural and ornamental plants, by causing direct damage and also indirectly as vectors of plant viruses (4,5,6,15). Aphids have many natural enemies including hymenopteran parasitoids, which may play a significant role in reducing aphid populations (9,23). These parasitoids belong to two groups: *Aphelinus* and related genera (Aphelinidae) and the aphidiines (Braconidae: Aphidiinae), which is comprised of approximately 60 genera and subgenera and more than 400 species from all over the world. Aphidiines are small wasps, with an adult size ranging from ~1 mm to several mm. They are all solitary endophagous parasitoids and strictly specific to aphids (14,18,21,23). Very few investigations of aphid parasitoids have been conducted in Turkey (7,8,16). The aim of this study was to survey the aphid parasitoids from a wide range of habitats in the Kahramanmaraş province of Turkey.

MATERIALS AND METHODS

Samples of plants, aphid hosts and parasitoids were collected between 1999 and 2001 from several different locations (Center, Pazarcık, Narlı, Türkoğlu, Çağlayancerit, Nurhak, Göksun, Afşin, Elbistan, Ekinözü and Andırın) in Kahramanmaraş Province, which is located between the eastern Mediterranean and the central Anatolia regions of Turkey. Both cultivated and non-cultivated areas were sampled, but our attention was centered on fruit and ornamental trees and on weeds in non-cultivated habitats.

Plant samples were placed separately in plastic bags and brought to the laboratory where the plants were identified to species. Pieces of plants with aphid colonies were

gently cut with scissors and placed in plastic cages to obtain parasitoid adults in the laboratory. Some of the collected aphids was preserved in 70% ethanol for subsequent identification. The emerging parasitoids were transferred with a fine brush into Eppendorf tubes containing 70% ethanol.

Parasitoid material was identified by P. Starý and voucher specimens are deposited in his collection (at České Budějovice).

REVIEW OF PARASITOID-APHID-PLANT ASSOCIATIONS

1. *Aphelinus* spp.

Aphis affinis Del Guercio: Andırın-Yenicekale, 16.VI.2000, and Suçatı, 27.V.2001, both on *Mentha arvensis*

DISCUSSION

Additional research is required on the parasitoids of aphids in Turkey. Until now, research has been directed predominantly to specific pest aphids on various crops, but a study of parasitoid-aphid-plant associations has been lacking. Research on native species as potential biocontrol agents for exportation also merits serious attention.

In the present survey 19 taxa of aphid parasitoids were found in the Kahramanmaraş area, which has not yet been exposed to massive applications of pesticides. The aphid hosts found include both economic and non-economic species, and certain species of aphid parasitoids attacked both types of host. The presumed switching of some parasitoid species between different aphid species belonging to these two groups, as well as the potential role of non-economic species as alternative hosts of key-parasitoid species, are topics worthy of further research.

We regard this study as only a preliminary step in describing the aphid-parasitoid complex of Turkey.

ACKNOWLEDGMENTS

Thanks are expressed to the authorities of the C.U. Agricultural Faculty, Plant Protection Department, for support of our research (M.M. Aslan). The research work (P. Starý) was also partially supported by grants A6007105 and S5007102 (Grant Agency of the Academy of Sciences of the Czech Republic) and from the Entomology Institute Project Z5007907 (Academy of Sciences of the Czech Republic).
