A three-component acid-catalyzed cyclocondensation of 5-aminoquinoline and 5-aminoisoquinoline with aromatic aldehydes and cyclopentadiene leads to ( $6S^*,6aR^*,9aS^*$ )-6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,7- and ( $6S^*,6aR^*,9aS^*$ )-6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,8-phenanthrolines.

**Key words:** three-component condensation, Povarov reaction, 5-aminoquinoline, 5-aminoisoquinoline, aromatic aldehydes, cyclopentadiene, tetrahydro-1,7-phenanthrolines, tetrahydro-1,8-phenanthrolines.

Phenanthroline tetrahydro derivatives, being analogues of alkaloids and diazasteroids, possess a high potential of biological activity.<sup>1,2</sup> Commonly, they are synthesized by the reaction of aminoquinolines with carbonyl compounds.<sup>3</sup> There is another very promising approach to the synthesis of diazasteroids, which is based on a three-component condensation of aminoquinolines with formaldehyde and cyclopentadiene.<sup>4,5</sup>

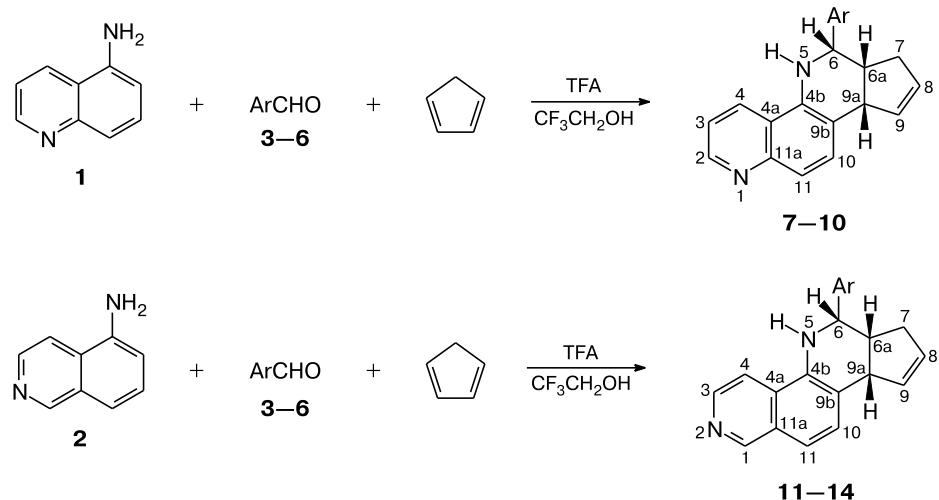

We were the first to study an acid-catalyzed one-step cyclocondensation of aminoquinolines with aromatic aldehydes and cyclopentadiene.

The reaction of 5-aminoquinoline (**1**) and 5-aminoisoquinoline (**2**) with aromatic aldehydes (benzaldehyde (**3**),

*m*-chloro- (**4**), *o*-fluoro- (**5**), and *p*-trifluoromethylbenzaldehydes (**6**)) and cyclopentadiene gave earlier unknown tetrahydro-1,7- and tetrahydro-1,8-phenanthrolines annulated to cyclopentene, which belong to the class of 4,11-diazasteroids.<sup>5</sup>

The reaction went smoothly when 2,2,2-trifluoroethanol was used as a solvent (room temperature, 2–3 h, catalyst trifluoroacetic acid (TFA)) and led to the target 6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,7- (**7–10**) and 6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,8-phenanthrolines (**11–14**) (Scheme 1). Running the reaction in acetonitrile<sup>6–8</sup> commonly used for such processes led only to the corresponding Schiff bases. It should be

Scheme 1

Ar = Ph (**3, 7, 11**), *m*-Cl-C<sub>6</sub>H<sub>4</sub> (**4, 8, 12**), *o*-F-C<sub>6</sub>H<sub>4</sub> (**5, 9, 13**), *p*-CF<sub>3</sub>-C<sub>6</sub>H<sub>4</sub> (**6, 10, 14**)

noted that in the cases when an amino group was located on the pyridine ring of quinolines (3- and 4-aminoquinolines), the corresponding tetrahydrophenanthrolines were not obtain even in trifluoroethanol.

The formation of 6-aryltetrahydrophenanthrolines annulated with cyclopentene occurred with high diastereoselectivity. The  $^1\text{H}$  NMR data (from the ratio of intensi-

ties of major and minor signals of vinyl protons H(8) or H(9) in the region 8.5.7–6.1) showed that the diastereomeric purity (*de*) of compounds **7–14** was no less than 90%. The spin-spin coupling constants for vicinal protons H(6) and H(6a) equal to 2.4 or 2.8 Hz, as well as that for protons H(6a) and H(9a) equal to 8.4 Hz (Tables 1 and 2) indicate a mutual *cis*-orientation of protons H(6), H(6a),

\* Chemical shifts  $\delta_{\text{H}}$  C(8)H and C(9)H for minor *6R*<sup>\*</sup>-diastereomers are given in parentheses.

and H(9a) and the *S*<sup>\*</sup>, *R*<sup>\*</sup>, and *S*<sup>\*</sup> relative configuration of asymmetric atoms C(6), C(6a), and C(9a), respectively. According to the data of the work,<sup>9</sup> the minor diastereomers differ from the major ones in the configuration of carbon atom C(6) bearing the aryl substituent, *i.e.*, the minor diastereomers have the *6R*<sup>\*</sup>, *6aR*<sup>\*</sup>, and *9aS*<sup>\*</sup> relative configuration of the chiral centers.

The signals in the  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra of synthesized compounds (see Tables 1 and 2) were assigned using 1D and 2D  $^1\text{H}$  and  $^{13}\text{C}$  NMR procedures (JMOD, HSQC, HMBC, COSY, NOESY). The mass spectra MALDI TOF of compounds **7–14** showed the presence of the corresponding molecular ions.

In conclusion, a three-component condensation in CF<sub>3</sub>CH<sub>2</sub>OH of aminoquinolines, aromatic aldehydes, and cyclopentadiene in the presence of TFA as a catalyst gives rise to (*6S*<sup>\*</sup>,*6aR*<sup>\*</sup>,*9aS*<sup>\*</sup>)-6-aryl-6,6a,7,9a-tetrahydro-5*H*-cyclopenta[*c*]-1,7- and -1,8-phenanthrolines, which are structural analogues of alkaloids and diazasteroids.

## Experimental

$^1\text{H}$  and  $^{13}\text{C}$  NMR spectra were recorded on a Bruker Avance-400 spectrometer (400.13 MHz  $^1\text{H}$  and 100.62  $^{13}\text{C}$  MHz) in CDCl<sub>3</sub>, using SiMe<sub>4</sub> as an internal standard. Homo- and heteronuclear procedures COSY, HSQC, and HMBC were carried out

according to the Bruker standard procedures. Mass spectra were obtained on a Bruker-Autoflex III instrument in the MALDI TOF regime with registration of positive ions and using  $\alpha$ -cyano-4-hydroxycinnamic acid as a matrix. Melting points were measured on a Boetius heating microstage. Elemental analysis was performed on a Carlo Erba EA-1108 CHNS-O-analyzer. Column chromatography was carried out on KSKG silica gel, 100/200. Silufol plates covered with  $\text{SiO}_2$  was used for TLC monitoring, visualizing with a solution of vanillin in ethanol acidified with sulfuric acid.

The starting compounds **1–6** were purchased from Acros Organics.  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra of compounds **7–10** and **11–14** are given in Tables 1 and 2, respectively.

**Synthesis of 6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,7- (7–10) and 6-aryl-6,6a,7,9a-tetrahydro-5H-cyclopenta[c]-1,8-phenanthrolines (11–14) (general procedure).** The compound  $\text{CF}_3\text{COOH}$  (0.08 mL, 1 mmol), a freshly distilled cyclopentadiene (0.33 mL, 4 mmol), and the corresponding aldehyde **3–6** (1 mmol) were sequentially added to a solution of aminoquinoline **1** or **2** (144 mg, 1 mmol) in anhydrous  $\text{CF}_3\text{CH}_2\text{OH}$  (15 mL) ( $\text{Ar}$ ,  $\sim 25^\circ\text{C}$ ). The reaction mixture was stirred at room temperature until the amine disappeared (2–3 h, TLC monitoring, eluent ethyl acetate). The solvent was evaporated, a saturated solution of  $\text{NaHSO}_3$ — $\text{NaHCO}_3$  was added to the residue until neutrality ( $\sim 5$  mL), followed by extraction with ethyl acetate ( $3 \times 10$  mL). The organic layer was concentrated, the residue was subjected to chromatography ( $\text{SiO}_2$ , *n*-hexane/ethyl acetate, 4 : 1) to isolate the corresponding 1,7- (**7–10**) or 1,8-phenanthrolines (**11–14**).

**(6S\*,6aR\*,9aS\*)-6-(m-Chlorophenyl)-6,6a,7,9a-tetrahydro-5H-cyclopenta[c][1,8]phenanthroline (12).** The yield was 70%, *de* 90% (from the ratio of signal intensities at  $\delta$  5.93 and 6.08),  $R_f$  0.40 (ethyl acetate), m.p. 89–91 °C (*n*-hexane). MS (MALDI TOF), *m/z*: 333 [M + H]<sup>+</sup>. Found (%): C, 75.76; H, 5.23; Cl, 10.42; N, 8.29.  $\text{C}_{21}\text{H}_{17}\text{ClN}_2$ . Calculated (%): C, 75.90; H, 5.12; Cl, 10.69; N, 8.43.

**(6S\*,6aR\*,9aS\*)-6-(o-Fluorophenyl)-6,6a,7,9a-tetrahydro-5H-cyclopenta[c][1,8]phenanthroline (13).** The yield was 70%, *de* 94% (from the ratio of signal intensities at  $\delta$  5.94 and 6.05),  $R_f$  0.42 (ethyl acetate), m.p. 58–60 °C (*n*-hexane). MS (MALDI TOF), *m/z*: 317 [M + H]<sup>+</sup>. Found (%): C, 79.87; H, 5.64; N, 8.73.  $\text{C}_{21}\text{H}_{17}\text{FN}_2$ . Calculated (%): C, 79.75; H, 5.40; N, 8.86.

**(6S\*,6aR\*,9aS\*)-6-[p-(Trifluoromethyl)phenyl]-6,6a,7,9a-tetrahydro-5H-cyclopenta[c][1,8]phenanthroline (14).** The yield was 62%, *de* 94% (from the ratio of signal intensities at  $\delta$  5.96 and 6.06),  $R_f$  0.50 (ethyl acetate), m.p. 52–54 °C (*n*-hexane). MS (MALDI TOF), *m/z*: 367 [M + H]<sup>+</sup>. Found (%): C, 72.23; H, 4.60; N, 7.58.  $\text{C}_{22}\text{H}_{17}\text{F}_3\text{N}_2$ . Calculated (%): C, 72.13; H, 4.64; N, 7.65.

The authors are grateful to Prof. L. M. Khalilov for discussion of  $^1\text{H}$  and  $^{13}\text{C}$  NMR spectra.

This work was financially supported by the Russian Foundation for Basic Research (Project No. 14-03-00286) and the Presidium of the Russian Academy of Sciences (Program "Fundamental Science to Medicine").
