The Faithfulness of F<sub>at</sub>: A Proof-Theoretic Proof

**Abstract.** It is known that there is a sound and faithful translation of the full intuitionistic propositional calculus into the atomic polymorphic system  $\mathbf{F}_{at}$ , a predicative calculus with only two connectives: the conditional and the second-order universal quantifier. The faithfulness of the embedding was established quite recently via a model-theoretic argument based in Kripke structures. In this paper we present a purely proof-theoretic proof of faithfulness. As an application, we give a purely proof-theoretic proof of the disjunction property of the intuitionistic propositional logic in which commuting conversions are not needed.

*Keywords*: Predicative polymorphism, Faithfulness, Natural deduction, Strong normalization, Intuitionistic propositional calculus, Disjunction property.

# 1. Introduction

A propositional formula is a formula built from a stock of propositional letters (or constants) P, Q, R, etc using the propositional connectives  $\bot, \land, \lor$  and  $\rightarrow$ . In [6], Prawitz defined the following translation:

$$(P)^* :\equiv P, \text{ with } P \text{ a propositional constant}$$
$$(\bot)^* :\equiv \forall X.X$$
$$(A \to B)^* :\equiv A^* \to B^*$$
$$(A \land B)^* :\equiv \forall X((A^* \to (B^* \to X)) \to X)$$
$$(A \lor B)^* :\equiv \forall X((A^* \to X) \to ((B^* \to X) \to X))$$

where X is a second-order propositional variable which does not occur in  $A^*$  or  $B^*$ . The target language is the language of Girard's (polymorphic) system **F** (cf. [5]). It consists of the smallest class of expressions which includes the atomic formulas (propositional constants  $P, Q, R, \ldots$  and second-order propositional variables  $X, Y, Z, \ldots$ ) and is closed under implication and second-order universal quantification. Note that the translation  $A^*$  of a propositional formula A is, clearly, a formula without second-order

Presented by Jacek Malinowski; Received February 10, 2015

free variables. Prawitz's translation is actually an embedding of the propositional intuitionistic calculus into system  $\mathbf{F}$  in the sense that if  $\vdash_i A$  then  $\vdash_{\mathbf{F}} A^*$  (here  $\vdash_i$  denotes provability in the intuitionistic propositional calculus and  $\vdash_{\mathbf{F}}$  denotes provability in the system  $\mathbf{F}$ ).

In 2006, the first author noticed (cf. [1]) that the above embedding still works if the target system  $\mathbf{F}$  is restricted to a predicative system nowadays known as  $\mathbf{F}_{at}$  (an acronym for *atomic polymorphism*). The atomic polymorphic system  $\mathbf{F}_{at}$  has the same formulas as  $\mathbf{F}$ , but replaces the second-order universal elimination rule by a predicative variant. For definiteness, we describe the (natural deduction) rules of  $\mathbf{F}_{at}$ . The introduction rules are as in  $\mathbf{F}$ :

$$\begin{array}{c} \langle A \rangle \\ \vdots \\ \hline B \\ \hline A \to B \end{array} \to \mathbf{I} \qquad \qquad \begin{array}{c} \vdots \\ \hline \forall X.A \\ \forall X.A \end{array} \forall \mathbf{I} \end{array}$$

where the notation  $\langle A \rangle$  says that the formula A is being discharged and, in the universal rule, X does not occur free in any undischarged hypothesis. The elimination rules of  $\mathbf{F}_{at}$  are, however,

$$\frac{\begin{array}{ccc} \vdots & \vdots \\ A \to B & A \\ B & \end{array} \to \mathbf{E} & \begin{array}{ccc} & \vdots \\ \forall X.A \\ A[C/X] \end{array} \forall \mathbf{E}$$

where C is an *atomic* formula (free for X in A), and A[C/X] is the result of replacing in A all the free occurrences of X by C. Note that only atomic instantiations are permitted in the  $\forall E$  rule. This contrasts with the (impredicative) system **F**, where C can be any formula.

The reason why, despite the restriction of the  $\forall$ E-rule, the system  $\mathbf{F}_{at}$  is still able to embed full intuitionistic propositional calculus lies in the availability of *instantiation overflow*, i.e., for the three types of universal formulas occurring in Prawitz's translation, it is possible to derive in  $\mathbf{F}_{at}$  the formulas resulting from instantiations of the second-order variable X by any formula, not only the atomic ones. For a complete description of instantiation overflow and of the embedding see [1,2]. In the former reference, it is also shown that  $\mathbf{F}_{at}$  has both the subformula property (for normal derivations) and an appropriate form of the disjunction property. (The notion of subformula only needs explanation for universal formulas. The proper subformulas of a formula of the form  $\forall X.A[X]$  are the subformulas of the formulas of the form A[C/X], for C an *atomic* formula free for X in A.) The latter reference is a study on the translation of the commuting conversions of the intuitionistic propositional calculus into  $\mathbf{F}_{at}$ . Note that, since the connectives  $\bot, \lor$ and  $\exists$  are absent from  $\mathbf{F}_{at}$ , this system has no commuting conversions. For more on  $\mathbf{F}_{at}$ , including a proof that the system is strongly normalizable for  $\beta\eta$ -conversions, see [3].

As we have discussed, Prawitz's translation  $(\cdot)^*$  gives a sound embedding of the intuitionistic propositional calculus into  $\mathbf{F}_{at}$ , that is: If  $\vdash_i A$  then  $\vdash_{\mathbf{F}_{at}} A^*$ . The translation is also faithful. I.e.:

If  $\vdash_{\mathbf{Fat}} A^*$  then  $\vdash_i A$ .

This latter fact was recently proved using a model-theoretic argument in [4]. In the present paper, we give a pure proof-theoretic proof of the faithfulness of  $\mathbf{F}_{at}$ . We believe that this approach is interesting in its own right. Furthermore, it shows how to obtain a proof-theoretic proof of the disjunction property for the intuitionistic propositional calculus via natural deduction *without* the need of commuting conversions. As we have suggested in previous papers (cf. [2,3]), the need for the *ad hoc* commuting conversions is a reflection of the fact that we are not considering intuitionistic propositional logic in its proper setting, viz the wider setting of  $\mathbf{F}_{at}$ .

The paper is organized in three sections. After this introduction, Sect. 2 presents the new proof-theoretic proof of the faithfulness of  $\mathbf{F}_{at}$ . The alternative proof of the disjunction property of the intuitionistic propositional calculus is presented in Sect. 3.

## 2. A Proof-Theoretic Proof of Faithfulness

A second-order universal formula which is a subformula of a formula of the form  $A^*$  (A a propositional formula) must take one of three forms:  $\forall X.X, \forall X((C^* \to (D^* \to X)) \to X) \text{ or } \forall X((C^* \to X) \to ((D^* \to X) \to X)), \text{ with } C \text{ and } D \text{ propositional formulas. Hence, the following definition}$ is in good standing:

DEFINITION 2.1. Let A be a propositional formula. For B any subformula of  $A^*$ , we define a formula  $\tilde{B}$  in the language of propositional calculus  $(\perp, \wedge, \lor, \rightarrow)$  extended with second-order variables (but without second-order quantifications) in the following way:

If B is atomic, then  $\tilde{B} :\equiv B$ . If  $B :\equiv C \to D$ , then  $\tilde{B} :\equiv \tilde{C} \to \tilde{D}$ . If  $B :\equiv \forall X.X$ , then  $\tilde{B} :\equiv \bot$ .

If 
$$B :\equiv \forall X((C^* \to (D^* \to X)) \to X)$$
, then  $\tilde{B} :\equiv C \land D$ .  
If  $B :\equiv \forall X((C^* \to X) \to ((D^* \to X) \to X))$ , then  $\tilde{B} :\equiv C \lor D$ 

Note that B and  $\tilde{B}$  have the same free variables. Also, when C is a propositional formula,  $\widetilde{C^{\star}}$  is just C.

LEMMA 2.2. Let  $\Gamma$  be a tuple of formulas in  $\mathbf{F}_{at}$  and A be a formula in  $\mathbf{F}_{at}$ with their free variables among the variables in  $\overline{X}$ . If there is a proof (say  $\mathcal{D}$ ) in  $\mathbf{F}_{at}$  of  $A[\overline{X}]$  from  $\Gamma[\overline{X}]$  in which all formulas (occurring in  $\mathcal{D}$  and  $\Gamma[\overline{X}]$ ) are subformulas of formulas of the form  $D^*$  (D a propositional formula), then

 $\tilde{\Gamma}[\bar{F}/\bar{X}] \vdash_i \tilde{A}[\bar{F}/\bar{X}]$ 

for any tuple of propositional formulas  $\overline{F}$ . For  $\Gamma[\overline{X}] :\equiv A_1[\overline{X}], \ldots, A_n[\overline{X}], \widetilde{\Gamma}[\overline{F}/\overline{X}]$  denotes the tuple of propositional formulas  $\widetilde{A}_1[\overline{F}/\overline{X}], \ldots, \widetilde{A}_n[\overline{F}/\overline{X}]$ . (Of course, the reading of  $\widetilde{A}[\overline{F}/\overline{X}]$  is to first consider the transformed formula  $\widetilde{A}$  and, afterwards, effect the substitution  $[\overline{F}/\overline{X}]$  in it. The alternative reading does not make sense in general.)

**PROOF.** By induction on the length of the derivation  $\mathcal{D}$ .

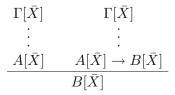

If  $\mathcal{D}$  is a one node proof-tree, then  $A[\bar{X}]$  is in  $\Gamma[\bar{X}]$ . The result is trivial since for any tuple  $\bar{F}$  of propositional formulas we have  $\tilde{A}[\bar{F}/\bar{X}] \vdash_i \tilde{A}[\bar{F}/\bar{X}]$ .

• Case where the last rule is a  $\rightarrow$ I:

$$\begin{array}{c} \langle A[\bar{X}] \rangle & \Gamma[\bar{X}] \\ \vdots \\ \\ \hline B[\bar{X}] \\ \hline A[\bar{X}] \to B[\bar{X}] \end{array}$$

Fix  $\overline{F}$  a tuple of propositional formulas. The aim is to prove that  $\Gamma[\overline{F}/\overline{X}] \vdash_i \widetilde{A}[\overline{F}/\overline{X}] \to \widetilde{B}[\overline{F}/\overline{X}]$ . According to the induction hypothesis, we have  $\widetilde{A}[\overline{F}/\overline{X}], \Gamma[\overline{F}/\overline{X}] \vdash_i \widetilde{B}[\overline{F}/\overline{X}]$ . Thus, adding an introduction rule for implication which discharges  $\widetilde{A}[\overline{F}/\overline{X}]$ , we get the desired result.

• Case where the last rule is a  $\rightarrow$ E:

Fix  $\overline{F}$  a tuple of propositional formulas. By induction hypothesis, we have both  $\widetilde{\Gamma}[\overline{F}/\overline{X}] \vdash_i \widetilde{A}[\overline{F}/\overline{X}]$  and  $\widetilde{\Gamma}[\overline{F}/\overline{X}] \vdash_i \widetilde{A}[\overline{F}/\overline{X}] \to \widetilde{B}[\overline{F}/\overline{X}]$ . Applying the elimination rule for implication, we get  $\widetilde{\Gamma}[\overline{F}/\overline{X}] \vdash_i \widetilde{B}[\overline{F}/\overline{X}]$ .

• Case where the last rule is a  $\forall I$ :

Since  $\forall X.A[\bar{Y}, X]$  is a subformula of a translated formula  $D^*$ , with D a propositional formula, we know that only three cases may occur: (i) A is X; (ii) A has the form  $(C^* \to (E^* \to X)) \to X$  or (iii) A has the form  $(C^* \to X) \to ((E^* \to X) \to X)$  with C and E propositional formulas. In any of the cases, the only free variable in A is X. So, in the scheme above,  $A[\bar{Y}, X]$  and  $\forall X.A[\bar{Y}, X]$  may be replaced by A[X] and  $\forall X.A[X]$  respectively.

In case (i), fix  $\overline{F}$  a tuple of propositional formulas and let us prove that  $\tilde{\Gamma}[\overline{F}/\overline{Y}] \vdash_i \bot$ . By induction hypothesis we know that  $\tilde{\Gamma}[\overline{F}/\overline{Y}] \vdash_i X[G/X]$  for every propositional formula G. Just take G as being  $\bot$ .

In case (ii), we need to prove that  $\Gamma[\bar{F}/\bar{Y}] \vdash_i C \wedge E$ , for every tuple  $\bar{F}$  of propositional formulas. Fix  $\bar{F}$ . By induction hypothesis, we know that  $\Gamma[\bar{F}/\bar{Y}] \vdash_i \tilde{A}[G/X]$  for any propositional formula G. In particular, for  $G :\equiv C \wedge E$ , we have

 $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i (C \to (E \to C \land E)) \to C \land E.$ 

Thus, in the natural deduction calculus for the intuitionistic propositional calculus, we have the following proof

Therefore,  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i C \wedge E$ .

In case (iii), we need to prove that  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i C \lor E$ , for every tuple  $\bar{F}$  of propositional formulas. Fix  $\bar{F}$ . By induction hypothesis, we know that  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i \tilde{A}[G/X]$ , for any propositional formula G. In particular, for  $G :\equiv C \lor E$ , we have

$$\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i (C \to C \lor E) \to ((E \to C \lor E) \to C \lor E).$$

Thus, in the intuitionistic propositional calculus, we have the following proof

Therefore,  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i C \lor E$ .

• Case where the last rule is a  $\forall E$ :

with C an atomic formula in  $\mathbf{F}_{at}$ , i.e., C is a propositional constant or a second-order variable. We assume w.l.o.g that if C is a second-order variable then C is among the variables  $\overline{Y}$ , say  $Y_i$ .

By hypothesis, since  $\forall X.A[X, \bar{Y}]$  is a subformula of a translated formula, we know that this formula falls into one of the following three cases: (i) it is the translation of  $\perp$ ; (ii) it is the translation of a conjunction; or (iii) it is the translation of a disjunction. Moreover,  $\forall X.A[X, \bar{Y}]$  has no free variables and so, in the scheme above we can replace  $\forall X.A[X, \bar{Y}]$  and  $A[C/X, \bar{Y}]$  by  $\forall X.A[X]$  and A[C/X], respectively.

In case (i), we have the following proof in  $\mathbf{F}_{\mathbf{at}}$ 

$$\Gamma[\bar{Y}]$$

$$\vdots$$

$$\frac{\forall X.X}{C}$$

and we want to prove that  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i C[F_i/Y_i]$ , for any tuple  $\bar{F}$  of propositional formulas. By  $F_i$  we denote the formula of the tuple  $\bar{F}$  which instantiates  $Y_i$  in  $\tilde{\Gamma}[\bar{F}/\bar{Y}]$ .

Fix  $\overline{F}$ . By induction hypothesis we know that  $\Gamma[\overline{F}/\overline{Y}] \vdash_i \bot$ . As a consequence, in the intuitionistic propositional calculus we have the following proof

Hence,  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i C[F_i/Y_i]$ . In case (ii), we have the following proof in  $\mathbf{F}_{\mathbf{at}}$ 

$$\begin{split} \Gamma[\bar{Y}] \\ \vdots \\ \forall X((H^{\star} \to (E^{\star} \to X)) \to X) \\ (H^{\star} \to (E^{\star} \to C)) \to C \end{split}$$

We want to prove that  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i (H \to (E \to C[F_i/Y_i])) \to C[F_i/Y_i]$ , for any tuple  $\bar{F}$  of propositional formulas. Fix  $\bar{F}$ . By induction hypothesis we know that  $\tilde{\Gamma}[\bar{F}/\bar{Y}] \vdash_i H \land E$ . Thus, we have the following proof in the intuitionistic propositional calculus

$$\begin{split} & \tilde{\Gamma}[\bar{F}/\bar{Y}] \\ & \vdots \\ & \tilde{\Gamma}[\bar{F}/\bar{Y}] \\ & \vdots \\ & \frac{H \wedge E}{H} \\ & \frac{E \to C[F_i/Y_i]) \land \frac{H \wedge E}{H}}{\frac{E \to C[F_i/Y_i]}{C[F_i/Y_i]}} \\ & \frac{E \to C[F_i/Y_i]}{(H \to (E \to C[F_i/Y_i])) \to C[F_i/Y_i]} \end{split}$$

This is what we want.

In case (iii), we have the following proof in  $\mathbf{F}_{\mathbf{at}}$ 

$$\begin{split} \Gamma[\bar{Y}] \\ \vdots \\ \forall X((H^{\star} \to X) \to ((E^{\star} \to X) \to X)) \\ \hline (H^{\star} \to C) \to ((E^{\star} \to C) \to C) \end{split}$$

Given any tuple  $\overline{F}$  of propositional formulas, the aim is to show that  $\widetilde{\Gamma}[\overline{F}/\overline{Y}] \vdash_i (H \to C[F_i/Y_i]) \to ((E \to C[F_i/Y_i]) \to C[F_i/Y_i])$ . Fix  $\overline{F}$ . By induction hypothesis,  $\widetilde{\Gamma}[\overline{F}/\overline{Y}] \vdash_i H \lor E$ . Thus, we have the following proof in the intuitionistic propositional calculus

$$\begin{split} &\tilde{\Gamma}[\bar{F}/\bar{Y}] \\ &\vdots \\ &H \lor E \quad \frac{\langle H \to C[F_i/Y_i] \rangle \quad \langle H \rangle}{C[F_i/Y_i]} \quad \frac{\langle E \to C[F_i/Y_i] \rangle \quad \langle E \rangle}{C[F_i/Y_i]} \\ &\frac{\frac{C[F_i/Y_i]}{(E \to C[F_i/Y_i]) \to C[F_i/Y_i]}}{(H \to C[F_i/Y_i]) \to ((E \to C[F_i/Y_i]) \to C[F_i/Y_i])} \end{split}$$

We are done.

THEOREM 2.3. (Faithfulness). Let  $\Gamma :\equiv A_1, \ldots, A_n$  and A be propositional formulas and consider their translations  $\Gamma^* :\equiv A_1^*, \ldots, A_n^*$  and  $A^*$  into  $\mathbf{F_{at}}$ .

If  $\Gamma^{\star} \vdash_{\mathbf{F}_{\mathbf{at}}} A^{\star}$  then  $\Gamma \vdash_i A$ .

PROOF. Suppose that  $\Gamma^* \vdash_{\mathbf{F}_{at}} A^*$ . Since  $\mathbf{F}_{at}$  has the normalization property (see [3]), we know that there is a proof, say  $\mathcal{D}$ , in normal form of  $A^*$  with premises  $\Gamma^*$ . By the subformula property (see [1, p. 5]), all formulas that occur in  $\mathcal{D}$  are subformulas of  $A^*$  or are subformulas of formulas in  $\Gamma^*$ . Therefore, we are in the conditions of application of Lemma 2.2. Applying such lemma, we conclude that  $\widetilde{\Gamma^*} \vdash_i \widetilde{A^*}$ , i.e.,  $\Gamma \vdash_i A$ .

## 3. Application

An advantage of having a sound and faithful embedding between two systems is the possibility to transfer certain results from one system to the other. In this section, as an application of the (proof-theoretic proof of the) faithfulness of  $\mathbf{F}_{at}$ , we give a new proof of the disjunction property of the intuitionistic propositional calculus. Note that the usual proof-theoretic proof via natural deduction of the disjunction property requires the introduction of extra conversions associated with the connectives  $\perp$  and  $\vee$ : the so called *commuting conversions* or *permutative conversions*. They are needed to ensure that a proof in normal form has the subformula property. The proof-theoretic proof that we present below does not rely on commuting conversions.

THEOREM 3.1. If  $\vdash_i A \lor B$  then  $\vdash_i A$  or  $\vdash_i B$ .

PROOF. Suppose that  $\vdash_i A \lor B$ . Since the embedding of the full intuitionistic propositional calculus into  $\mathbf{F}_{at}$  is sound, we have  $\vdash_{\mathbf{F}_{at}} (A \lor B)^*$ . Applying the disjunction property of  $\mathbf{F}_{at}$  (see [1, pp. 5–7]), we know that  $\vdash_{\mathbf{F}_{at}} A^*$  or  $\vdash_{\mathbf{F}_{at}} B^*$ . By Theorem 2.3 (faithfulness), we conclude  $\vdash_i A$  or  $\vdash_i B$ .
